**Commission's Decision**

1. RESPONDENT THE FEDERAL POWER COMMISSION'S "ORDER REDUCING RATES," DATED MAY 26, 1942 ..... 1

2. RESPONDENT THE FEDERAL POWER COMMISSION'S "FINDINGS AS TO LAWFULNESS OF PAST RATES," DATED MAY 26, 1942 ..... 8

3. RESPONDENT THE FEDERAL POWER COMMISSION'S "OPINION NO. 76," TOGETHER WITH CONCURRING OPINION OF COMMISSIONER MANLY AND PARTIALLY DISSENTING OPINION OF COMMISSIONER SCOTT, DATED MAY 26, 1942 14

**List of Exhibits**

4. COMPLETE LIST OF EXHIBITS BY ABBREVIATED TITLES CLASSIFIED BY SUBJECT MATTER ..... 91

**Description of the Company**

5. COMPANY WITNESS TONKIN'S EXHIBIT NO. 4 ENTITLED: "The Company's Properties, Markets, Sources of Gas Supply and the Development of Its Properties: Explanation of Company Exhibits Nos. 1, 2 and 3—Written Statement of Loring L. Tonkin."

*Except*: Section G, pages 46 to 65 (except last line), inclusive ..... 103

**Rate Base**

6. COMPANY WITNESS RHODES' EXHIBIT NO. 16-A ENTITLED: "Reproduction Cost New of Company Properties as of December 31, 1938—Written Statement of George I. Rhodes and Summary."

*Except*: Sections 5, 6, 7, 8, 9 and 10, Pages 17 to 29, inclusive ..... 143

Page

7. COMPANY WITNESS ANTONELLI'S EXHIBIT NO. 20 ENTITLED: "Original Cost and Original Cost Trended to 1938 Prices of the Company's Natural Gas Production Plant, Transmission Plant and General Plant (Jointly Used) Existing at December 31, 1938—Written Statement of Peter Antonelli."

*Except*: Statements C, D, E, F and G, Pages 33 to 54, inclusive, and Statement I, Pages 63 to 96, inclusive..... 167

8. COMMISSION WITNESSES PACE'S AND DUNN'S EXHIBIT NO. 57 ENTITLED: "Original Cost of Gas Plant as at December 31, 1938, Volume I."

*Except*: Schedules 2 to 37, inclusive, Pages 13 to 64, inclusive..... 209

9. TESTIMONY OF COMMISSION WITNESS CHARLES W. SMITH AS TO PRINCIPLES OF ACCOUNTING, TUESDAY, APRIL 22, 1941, RECORD PAGES 2702 TO 2823..... 225

10. TESTIMONY OF COMMISSION WITNESS JOHN W. PACE AS TO DETERMINATION OF ADJUSTED BOOK COST, WEDNESDAY, APRIL 23, 1941, RECORD PAGES:

2861, line 2, to 2863, line 25, inclusive;
2871, line 5, to 2873, line 15, inclusive;
2877, line 24, to 2893, line 23, inclusive;
2895, line 5, to 2899, line 2, inclusive;
2903, line 19, to 2911, line 23, inclusive;
2941, line 7, to 2949, line 22, inclusive;
2953, line 21, to 2957, line 1, inclusive;
2964, lines 20 to 24, inclusive;
2972, line 17, to 2974, line 2, inclusive..... 309

11. TESTIMONY OF COMPANY WITNESS PETER ANTONELLI AS TO ORIGINAL COST OF PROPERTIES ACQUIRED FROM PRIOR UTILITIES, MONDAY, JULY 7, 1941, RECORD PAGES 5042, LINE 5 AND LINE 10 TO 5049, LINE 7, INCLUSIVE..... 342

Page

12. COMPANY WITNESS ANTONELLI'S EXHIBIT NO. 59 ENTITLED: "Comparison of Original Cost (Exhibit No. 20) with F. P. C. Examiners' Adjusted Book Cost (Exhibit No. 57)" ..... 347

13. COMPANY WITNESS RHODES' EXHIBIT NO. 21 ENTITLED: "Reproduction Cost New Less Depreciation of Company Properties as of December 31, 1938—Written Statement of George I. Rhodes."

*Except*: Page 4 and first 2 lines and first full paragraph of page 5;

First 4 paragraphs of Section 3 at pages 5 to 7 inclusive..... 355

14. TESTIMONY OF COMMISSION WITNESS CHARLES W. SMITH AS TO PRINCIPLES OF DEPRECIATION, WEDNESDAY, APRIL 23, 1941, RECORD PAGES 2826, LINE 14, TO 2850, LINE 18, INCLUSIVE..... 373

15. COMPANY'S EXHIBIT NO. 108 ENTITLED: "Photostatic Copy of Certified Copy of the Records of the Board of Public Works of the State of West Virginia Showing the Valuation of the Company's Properties Fixed for Taxation Purposes for the Year 1941" (Not Admitted) ..... 391

**Rate of Return**

16. COMPANY WITNESS BROWN'S EXHIBIT NO. 19 ENTITLED: "Rate of Return—Written Statement of Percy W. Brown"..... 394

17. COMPANY WITNESS COFFMAN'S EXHIBIT NO. 27 ENTITLED: "Investors' Appraisal of Comparative Risks of Capital in the Natural Gas Business, 1937-1939—Written Statement of Paul B. Coffman."

*Except*: Statements A, B, C, D, D-1, and E, pages 21 to 33, inclusive..... 422

Page

18. COMPANY WITNESS COFFMAN'S EXHIBIT NO. 27-A ENTITLED: "Investors' Appraisal of Comparative Risks of Capital in the Natural Gas Business, 1940 (Supplement to Exhibit No. 27)."

*Except*: Statements A, B, C, D, and D-1, pages 3 to 7, inclusive..... 440

19. TESTIMONY OF COMPANY WITNESS PERCY W. BROWN AS TO PRESENT AND HISTORICAL RATE OF RETURN, WEDNESDAY, JULY 9, 1941, RECORD PAGES 5200 TO 5229..... 443

**Operating Expenses and Return Earned**

20. COMPANY WITNESS RHODES' EXHIBIT NO. 24 ENTITLED: "Necessary Annual Rates for Depreciation—Written Statement of George I. Rhodes."

*Except*: Sub-sections (a), (b), (c), and (d) of section 4, pages 7 to 11, inclusive;

All but first sentence of first paragraph of section 6, page 12;

All but first two sentences of second paragraph of section 6, pages 12 to 13;

All but first sentence of section 8, page 14;

Tables B to N, inclusive, at pages 20 to 32, inclusive..... 465

21. COMPANY WITNESS SULLIVAN'S EXHIBIT NO. 126 ENTITLED: "Average Return from the Company's Export Business, 1937-1940, Based on the Company's Claims as to Rate Base as of December 31, 1938 and Operating Expenses"..... 479

Page

22. TESTIMONY OF COMPANY WITNESS EUGENE P. SULLIVAN AS TO EXHIBIT NO. 126 SHOWING AVERAGE RETURN FROM THE COMPANY'S EXPORT BUSINESS, WEDNESDAY, JULY 16, 1941, RECORD PAGES:

6198, line 3, to 6203, line 4, inclusive;
6204, line 3, to 6207, line 7, inclusive;
6208, lines 8 to 22, inclusive;
6210, line 9, to 6211, line 7, inclusive;
6212, lines 1 to 17, inclusive;
6215, line 4, to 6216, line 14, inclusive;
6218, lines 7 to 17, inclusive;
6227, lines 3 to 20, inclusive ..... 483

23. COMMISSION WITNESS DUNN'S EXHIBIT NO. 90 ENTITLED: "Rate of Return Earned on Original Cost Base Years 1937 to 1940, Inclusive."

*Except*: Schedule 1A, page 7, and Schedules 2A and 2B, pages 9 and 10 ... 493

24. TESTIMONY OF COMPANY WITNESS LORING L. TONKIN AS TO ABILITY OF THE COMPANY TO MEET WAR DEMANDS, SATURDAY, JULY 12, 1941, RECORD PAGES 5764, LINE 15, TO 5771, LINE 4, INCLUSIVE ..... 503

In the Matter of
Hope Natural Gas Company
Docket No. G-113

### ORDER REDUCING RATES

Upon consideration of the complaints, answers, petitions, and orders previously entered in these proceedings, the evidence of record, the briefs and oral arguments, and the Commission having on this date entered and

issued its Opinion No. 76 which is hereby incorporated by reference and made a part hereof;

—2—

The Commission *finds* that:

(1) Hope Natural Gas Company (hereinafter designated as the "Company") is a corporation organized and existing under the laws of the State of West Virginia;

(2) The Company purchases and produces natural gas within the State of West Virginia;

(3) The Company transports, delivers and sells large quantities of the natural gas referred to in Finding (2) to The East Ohio Gas Company and The River Gas Company at points on and along the interstate boundary between the States of West Virginia and Ohio, which gas is so transported and sold at wholesale for the purpose of resale for ultimate public consumption at points outside the State of West Virginia;

(4) The Company transports, delivers and sells large quantities of the natural gas referred to in Finding (2) to The Peoples Natural Gas Company and Fayette County Gas Company at points along the interstate boundary between the States of West Virginia and Pennsylvania, which gas is so transported and sold at wholesale for the purpose of resale for ultimate public consumption at points outside the State of West Virginia;

(5) The Company transports, delivers and sells quantities of the natural gas referred to in Finding (2) to The Manufacturers Light and Heat Company at points within the State of West Virginia, which gas is transported and sold to such purchaser at wholesale for the purpose of resale for ultimate public consumption at points outside the State of West Virginia;

(6) The transportation and sale by the Company of natural gas at the several points of delivery to the several purchasers and for the purposes stated in Findings (3), (4) and (5) constitute, in each in-

stance, the transportation and sale of natural gas in interstate commerce within the purview of the Natural Gas Act, and the rates charged and collected by the Company for the natural gas so transported and sold are subject to the jurisdiction of the Federal Power Commission;

(7) The evidence of the reproduction cost new of the Company's property used and useful in the production, transportation, delivery and sale of natural gas to the interstate wholesale purchasers named above (as of December 31, 1938) as presented by the Company in these proceedings, is hypothetical, conjectural and inherently fallacious and cannot be considered as having probative value in the determination of the allowable rate base;

—3—

(8) The evidence of the trended "original cost" of the Company's property (as of December 31, 1938) as presented by the Company is basically erroneous and cannot be considered as having probative value in the determination of the allowable rate base;

(9) The Company's restated "original cost" of its property (as of December 31, 1938) erroneously includes items and amounts in excess of the actual legitimate cost thereof as such cost is controlled by fundamental principles of cost determination, and as defined in the Federal Power Commission's Uniform System of Accounts and by decisions of this Commission;

(10) Equity and justice require the elimination of such erroneously included items and amounts referred to in Finding (9) in determining the rate base upon which the Company is entitled to earn a fair rate of return;

(11) The actual legitimate cost of the Company's property, exclusive of distribution property, property used to transport coke-oven gas, and unoperated acreage was $51,957,416 as of December 31, 1940;

(12) The actual existing depletion and depreciation in the Company's property, exclusive of distribution property, property used to transport coke-oven gas, and unoperated acreage, was $22,328,016 as of December 31, 1940;

(13) The actual legitimate cost of the Company's property, less actual existing depletion and depreciation, exclusive of distribution property, property used to transport coke-oven gas, and unoperated acreage, was $29,629,400 as of December 31, 1940;

(14) The Company's unoperated acreage is useful or imminently useful and is necessary for the continued and efficient production of natural gas and its cost should be included in the rate base;

(15) The actual legitimate cost of such unoperated acreage was $566,105 as of December 31, 1940; and is a reasonable amount to be included in the rate base for fixing future rates;

(16) Materials and supplies and cash working capital in the amount of $2,125,000 are necessary for the continued and efficient operation of the Company's interstate natural gas business and should be allowed in the rate base;

(17) The additional capital expenditures (less increases in depletion and depreciation reserves) in the three-year period, 1941-1943, will result in an average increase in net actual legitimate cost for that period of $1,392,021; and such sum should be allowed in the rate base for the determination of reasonable future rates;

—4—

(18) For the purpose of determining just and reasonable rates for the future, the rate base represented by the actual legitimate cost of the Company's property used and useful in the production, transportation and sale of natural gas in interstate commerce (Finding (13)), plus unoperated acreage, working capital and future net capital additions, is $33,712,526;

(19) The fair rate of return for the Company is not more than 6½% per annum; and $2,191,314 is the

maximum fair annual return which the Company is entitled to earn on the rate base;

(20) The operations for 1940, as adjusted, are a proper basis for fixing future rates;

(21) The operating revenues from interstate sales were $19,296,755 for 1940;

(22) The proper credit to the Company's operating expenses for the excess profits from the gasoline and butane extracted from its gas by the affiliated Hope Construction & Refining Company is $185,105 and for steam and boiler fuel furnished the affiliate is $119,592, or a total of $304,697 for the determination of future rates;

(23) Reasonable and proper allowances for operating expenses (including amortization of reclassification and rate case expenses) and after allocation of costs to local West Virginia sales, miscellaneous gas revenues, and the amount of tax required under lawful rates, are as follows:

| | |
|---|---|
| Operating Expenses | $16,272,934 |
| Miscellaneous Gas Revenues | (83,275) |
| Allocation of Costs to Local West Virginia Sales | (2,694,075) |
| Total Deductions from Interstate Revenues | $13,495,584 |

(24) The rates charged and received by the Company for the transportation and sale of natural gas in interstate commerce for resale for ultimate public consumption are unjust, unreasonable, and excessive, and therefore unlawful, to the extent of $3,609,857 annually, determined as follows:

| | |
|---|---|
| Revenues from Interstate Sales | $19,296,755 |
| Operating Deductions | 13,495,584 |
| Net Operating Income from Interstate Sales | 5,801,171 |
| 6½% Return on Interstate Rate Base | 2,191,314 |
| Excess | $ 3,609,857 |

—5—

(25) The total allowable cost of all interstate services of the Company is $13,495,584 plus $2,191,314 for a fair return, or $15,686,898;

(26) The average rates and charges per m.c.f. of the Company, after reflecting the reductions hereinafter ordered, will be just and reasonable;

Therefore, the Commission *orders* that:

(A) The rates charged and received for the transportation and sale of natural gas by Hope Natural Gas Company in interstate commerce for resale for ultimate public consumption shall be decreased to reflect a reduction, on an annual basis, of not less than $3,609,857 in the operating revenues of that Company;

(B) The following just and reasonable average rates per m.c.f. shall be charged the five customer companies in the future:

| | *Average Rate Per M.c.f.—Cents* |
|---|---|
| The East Ohio Gas Company | 29.5 |
| The Peoples Natural Gas Company | 28.5 |
| Fayette County Gas Company | 28.5 |
| The Manufacturers Light and Heat Company | 28.5 |
| The River Gas Company | 35.0 |

(C) The Hope Natural Gas Company shall file, on or before July 1, 1942, new schedules of rates and charges for the transportation and sale of natural gas in interstate commerce to its five customer companies for resale for ultimate public consumption, which shall reflect not less than the reduction ordered in paragraph (A) and shall be the average rates per m.c.f. ordered for the respective companies in paragraph (B);

(D) The new schedules of rates and charges ordered in paragraph (C) shall be effective as to all bills based on meter readings made on or after July 15, 1942;

(E)—On and after the effective date of the new schedules of rates and charges, filed and made effective in accordance with paragraphs (C) and (D), the Hope Natural Gas Company shall cease and desist from making, demanding or receiving any rates and charges other than those ordered in these proceedings until changed by order of this Commission.

By the Commission.

(Signed) LEON M. FUQUAY,
Secretary.

## 2. RESPONDENT THE FEDERAL POWER COMMISSION'S "FINDINGS AS TO LAWFULNESS OF PAST RATES," DATED MAY 26, 1942.

vs.
Hope Natural Gas Company, Defendant
Docket No. G-127

In the Matter of
Hope Natural Gas Company
Docket No. G-113

### FINDINGS AS TO LAWFULNESS OF PAST RATES

Upon consideration of the City of Cleveland's complaint and amendment, the Company's answers, the petitions and orders previously entered in these proceedings,

the evidence of record, the briefs and oral arguments, and the Commission having on this date entered and issued its Opinion No. 76 and order, which Opinion is hereby incorporated by reference and the appropriate portions are made a part hereof;.

—2—

The Commission *finds* that:

(1) The City of Cleveland raised the issue of the lawfulness of the rate charged The East Ohio Gas Company by Hope Natural Gas Company, and requested this Commission to find the just, reasonable and lawful rate from June 30, 1939, to the date of this determination, as an aid to State regulation;

(2) The Commission has jurisdiction and authority to make such findings which are in the public interest;

(3) Hope Natural Gas Company is a corporation organized and existing under the laws of the State of West Virginia;

(4) Hope Natural Gas Company purchases and produces natural gas within the State of West Virginia;

(5) Hope Natural Gas Company transports, delivers and sells large quantities of the natural gas referred to in Finding (4) to The East Ohio Gas Company at points on and along the interstate boundary between the States of West Virginia and Ohio, which gas is so transported and sold at wholesale for the purpose of resale for ultimate public consumption at points outside the State of West Virginia;

(6) The transportation and sale of natural gas by Hope Natural Gas Company stated in Finding (5) constitute the transportation and sale of natural gas in interstate commerce within the purview of the Natural Gas Act, and the rates charged and collected by Hope for the gas so transported and sold have been subject to the exclusive jurisdiction of this Commission since June 21, 1938;

(7) The evidence of reproduction cost new of the Hope Company's property used and useful in the production, transportation, delivery and sale of natural gas to its five interstate wholesale purchasers (as of December 31, 1938), as presented by the Company in these proceedings is hypothetical, conjectural and inherently fallacious and cannot be considered as having probative value in the determination of the allowable rate base;

(8) The evidence of the trended "original cost" of Hope Company's property (as of December 31, 1938), as presented by the Company, is basically erroneous and cannot be considered as having probative value in the determination of the allowable rate base;

(9) The Hope Company's restated "original cost" of its property (as of December 31, 1938) erroneously includes items and amounts in excess of the actual legitimate cost thereof as such cost is controlled by fundamental principles of cost determination, and as defined in the Federal Power Commission's Uniform System of Accounts and by decisions of this Commission;

—3—

(10) Equity and justice require the elimination of such erroneously included items and amounts referred to in Finding (9) in determining the rate base upon which the Company is entitled to earn a fair rate of return;

(11) The actual legitimate cost of Hope Natural Gas Company's property, excluding distribution property, property used to transport coke-oven gas, and unoperated acreage, was $51,019,583 for 1939 and $51,957,416 for 1940;

(12) The actual existing depletion and depreciation in Hope Natural Gas Company's property was $21,737,823 for 1939 and $22,328,016 for 1940, and the resulting actual legitimate cost, less actual existing depletion and depreciation, and excluding distribution property, property used to transport coke-oven gas and unoperated acreage, was $29,281,762 for 1939 and $29,629,400 for 1940;

(13) The unoperated acreage was useful or imminently useful and the actual legitimate cost of such acreage in the amounts of $567,152 for 1939 and $566,195 for 1940 should be included in the rate bases;

(14) Materials and supplies and cash working capital were necessary in the amounts of $2,100,000 for 1939 and $2,125,000 for 1940, and should be allowed in the rate bases;

(15) For the purpose of determining what rates were just, reasonable and lawful since June 30, 1939, the average rate base represented by the actual legitimate cost of Hope Natural Gas Company's property used and useful in rendering interstate service (Finding (12)), plus the cost of unoperated acreage and the necessary working capital, was $32,326,398 for 1939, $32,134,710 for 1940, and $33,712,526 since 1940;

(16) A rate of return of 6½% was liberal for the period of June 30, 1939, to date;

(17) The actual operations for 1939 and 1940 are the reasonable and proper bases for determining lawful rates in those years, and 1940 operations, as adjusted, are the reasonable and proper basis for determining lawful rates since 1940;

(18) The operating revenues from interstate sales were $14,866,894 for 1939 and $19,296,755 for 1940;

(19) The proper credit to Hope Natural Gas Company's operating expenses for the excess profits from the gasoline and butane extracted from its gas by its affiliate, Hope Construction & Refining Company, and for steam and boiler fuel furnished the affiliate, was $352,516 for 1939, $304,697 for 1940 and $304,697 annually since 1940;

—4—

(20) Reasonable and proper allowances for operating expenses (including amortization of reclassification and rate case expenses) and after allocation of costs to local West Virginia sales, miscellaneous gas revenues and the amount of tax required under lawful rates, are as follows:

| | 1939 | 1940 | Since 1940 |
|---|---|---|---|
| Operating Expenses | $14,242,454 | $15,775,195 | $16,272,934 |
| Miscellaneous Gas Revenues | ( 68,695) | ( 83,275) | ( 83,275) |
| Allocation of Costs to Local West Virginia Sales | ( 2,328,110) | ( 2,694,075) | ( 2,694,075) |
| Total Deductions from Interstate Revenues | $11,845,649 | $12,997,845 | $13,495,584 |

(21) The rates charged and received by the Company for the transportation and sale of natural gas in interstate commerce for resale for ultimate public consumption were unjust, unreasonable and excessive, and therefore unlawful, to the extent of $920,029 for the year 1939, $4,210,154 for the year 1940, and $3,609,857 since 1940 (on an annual basis), determined as follows:

| | 1939 | 1940 | Since 1940 |
|---|---|---|---|
| Revenues from Interstate Sales | $14,866,894 | $19,296,755 | $19,296,755 |
| Operating Deductions | 11,845,649 | 12,997,845 | 13,495,584 |
| Net Operating Income from Interstate Sales | 3,021,245 | 6,298,910 | 5,801,171 |
| 6½% Return on Interstate Rate Base | 2,101,216 | 2,088,756 | 2,191,314 |
| Excess | $ 920,029 | $ 4,210,154 | $ 3,609,857 |

(22) The total required revenue for all interstate service of the Company was $13,946,865 for 1939, $15,086,601 for 1940 and $15,686,898 annually since 1940;

(23) Cost, conditions and characteristics of service show that the just, reasonable and lawful rates for natural gas sold by Hope Natural Gas Company in interstate commerce to The East Ohio Gas Company for resale for ultimate public consumption were those required to produce compensation in the amount of $11,528,608 for 1939, $11,507,185 for 1940, and $11,910,947 annually since 1940;

—5—

(24) The rates charged and received by the Hope Natural Gas Company for the transportation and sale of natural gas in interstate commerce to The

East Ohio Gas Company for resale for ultimate public consumption were unjust, unreasonable, excessive, and therefore unlawful to the extent of $830,892 during 1939, $3,219,551 during 1940, and $2,815,789 on an annual basis since 1940.

By the Commission.

(Signed) LEON M. FUQUAY,
Secretary.

## OPINION

BY THE COMMISSION:

These proceedings grew out of complaints filed by the cities of Cleveland and Akron, Ohio, and were enlarged by the Commission's Order of October 14, 1938, for an investigation of the reasonableness of all the interstate wholesale rates of Hope Natural Gas Company under the provisions of the Natural Gas Act.[1]

The cities of Cleveland and Akron, Ohio, filed with the Commission complaints alleging that the price charged by Hope Natural Gas Company to East Ohio Gas Company for natural gas was unreasonable and unduly discriminatory. The Pennsylvania Public Utility Commission also filed a complaint asserting that the rates charged by Hope Natural Gas Company to Peoples Natural Gas Company, Fayette County Gas Company and the Manufacturers Light and Heat Company were unlawful.

The three complaint proceedings and the proceeding instituted by the Commission were consolidated for purposes of hearing. Upon petition, the Public Service Commission of West Virginia, the State of West Virginia and the City of Toledo, Ohio, were permitted to become interveners in the consolidated proceedings.

Hearings were held, pursuant to order and notice, at intervals during 1940 at which Hope presented its case-in-

—2—

chief. After written and oral argument the motion of the cities of Cleveland and Akron for an immediate order reducing rates to East Ohio Gas Company was denied for insufficiency of evidence. Additional hearings were conducted during the first half of 1941 and concluded in July. The evidence presented during the 43 days of hearings

[1] The term "interstate wholesale" when used in this Opinion means the sale of natural gas in interstate commerce for resale for ultimate public consumption for domestic, commercial, industrial, or any other use.

covered all issues and embraced nearly a gross of extensive exhibits and about 7,000 pages of transcript. Each party to these proceedings was cognizant of the issues and was afforded ample opportunity to present evidence. Comprehensive briefs have been filed and the Commission, sitting *en banc*, has heard extensive oral argument.

## JURISDICTION

The jurisdiction of the Commission was not challenged in these proceedings. The facts show and counsel for Hope Natural Gas Company have stipulated that Hope transports and sells natural gas in interstate commerce to five companies for resale for ultimate public consumption.[2] Hope is a natural gas company within the purview of the Natural Gas Act and we may proceed with the determination of the lawfulness of its interstate wholesale rates. See *Illinois Natural Gas Co. v. Central Illinois Public Service Co.*, 314 U. S. 498; *Federal Power Commission v. Natural Gas Pipeline Co.*, 315 U. S. ....

—3—

## OPERATIONS OF THE COMPANY

The Hope Natural Gas Company was organized in 1898 in West Virginia and is a subsidiary of Standard Oil Company (N. J.). Its property, composed of approximately 5,000 miles of pipe lines and 3,000 gas wells in West Virginia, is an integral part of the interconnected Standard

[2] Hope's pipe lines interconnect with those of its five wholesale customers and the gas which it sells to those companies flows in interstate commerce without interruption and is resold in Ohio and Pennsylvania. Hope sells and delivers gas (1) to the East Ohio Gas Company and the River Gas Company at several points along the West Virginia-Ohio state boundary; (2) to the Peoples Natural Gas Company and the Fayette County Gas Company at points on the West Virginia-Pennsylvania state boundary; and (3) to the Manufacturers Light and Heat Company in northern West Virginia, which transports and sells such gas in Pennsylvania for ultimate public consumption.

Oil System which serves the Appalachian area with natural gas. The major customers of Hope are its affiliates, The East Ohio Gas Company and The Peoples Natural Gas Company, which serve a large area including Cleveland, Akron, Youngstown, Massillon, Canton, Pittsburgh and Altoona. Hope also sells gas to its affiliate, The River Gas Company, and to two non-affiliates, Fayette County Gas Company and The Manufacturers Light and Heat Company. Hope produces about one-third of its total annual gas requirements and purchases the remaining two-thirds under more than 300 contracts.[3]

In 1940, Hope handled about 74,000,000 m.c.f. of gas and sold: (1) more than 40,000,000 m.c.f. to East Ohio Gas Company; (2) about 10,000,000 m.c.f. to Peoples Natural Gas Company; (3) more than 2,000,000 m.c.f. to Manufacturers Light and Heat Company; (4) approximately 860,000 m.c.f. to Fayette County Gas Company; (5) nearly 400,000 m.c.f. to River Gas Company; and (6) more than 11,000,000

—4—

m.c.f. to local consumers in West Virginia. The remainder totaling about 9,000,000 m.c.f. was gas lost or used in Company operations.

Hope's natural gas is processed by an affiliate, Hope Construction & Refining Company, for the purpose of extracting the natural gasoline and butane. Another affiliate, the Domestic Coke Corporation, sells its by-product coke-oven gas to Hope for use as boiler fuel in Hope's main compressor station.[4]

---

[3] Hope purchases coke-oven gas from the affiliated Domestic Coke Corp. and transports the gas to Hastings for use as compressor station fuel. It is agreed that the property and costs relating to that transaction be eliminated and the equivalent m.c.f. of natural gas be substituted at Hastings compressor station at a cost of 22¢ per m.c.f.

[4] Hope Natural Gas Company in December 1939 merged the former Reserve Gas Company, but by agreement between counsel that property and income have been segregated and excluded for the purposes of these proceedings.

## CORPORATE AND FINANCIAL HISTORY

Hope Natural Gas Company is a large, seasoned and successful utility, and du. ng its corporate history of more than forty years its capita structure has been solely in the form of common stock. Since 1908, it has been a subsidiary of Standard Oil Company (N. J.) and all of its outstanding capital stock, having an aggregate par value of approximately $28,000,000, is owned by Standard.

During Hope's existence it has paid more than $108,000,000 in dividends, $11,000,000 of which were stock dividends. From 1898 to 1941 the average annual cash dividends to stockholders exceeded 20% on the average annual amount of capital stock issued for cash or other assets.

The Company presented its balance sheet as an exhibit, which shows an owner's equity in assets, at the end of 1938, of more than $33,000,000, comprising $28,000,000 of

—5—

capital stock and $5,000,000 of surplus. This equity is represented in assets principally by gas plant in the net amount of $15,500,000, Government bonds of $11,000,000, and cash and investments of $5,500,000. The $15,500,000 net investment per books in the Company's gas plant, including distribution property, is actually about $8,000,000, because the Company had previously transferred $7,500,000 from depletion and depreciation reserves to earned surplus.[5]

---

[5] Source: Ex. No. 11, pp. 10 and 21; Ex. 61, p. 3.

| | | |
|---|---|---|
| Plant, Dec. 31, 1938, per books (including Distribution Property of about $2,795,000) | $56,213,454 | |
| Depreciation and depletion reserve, per books | 40,633,562 | |
| | | 15,579,892 |
| Less adjustments in 1934 ($5,901,000) and in 1908 ($1,650,000) transferring these amounts from depreciation and depletion reserve to earned surplus | | 7,551,000 |
| Net Investment | | $ 8,028,892 |

We will now proceed to the pragmatic determination of the lawful rates, within the ambit of our statutory authority.

## RATE BASE

The Hope Company claimed a rate base of $66,000,000 and calculated that it was earning a rate of return of about 3% from its interstate business on that base. The claimed rate base was molded from an estimate of the cost to reproduce the property less observed depreciation, plus working capital. The derived rate of return was based upon the Company's presentation of revenues and expenses averaged for 1937, 1938 and 1939.

—6—

*The Company's Estimates of Reproduction Cost and Trended "Original Cost"*

The estimate of the Company approximated $97,000,000 for the cost to reproduce the property. That result was reached by applying unit prices for material and labor to an inventory and adding about 17% to that total for undistributed construction costs.

Many hypotheses were employed for this reproduction-cost estimate and each of them disregards the development and experience of the Hope Company. Quoted prices for pipe and other material, rather than actual current prices, were used and obsolete compressor station equipment was priced by applying quoted prices for modern equipment. The record demonstrates that the quoted price for pipe is not in fact the price that is paid. Actual prices are the result of negotiation. The calculated construction costs exceeded the actual pipe line construction costs experienced by the Hope Company during a recent period. This appraisal of the cost to reproduce the system included $14,000,000 for undistributed construction costs or overheads which ignored the experience of the Company with

respect to such costs and the fact that Hope has charged all overhead expenditures (with minor exceptions) to operating expenses in the past. It is improper and inequitable to capitalize items formerly charged to operating expenses, and in rate-making the inclusion of such expenses in the rate base would compel the rate payer to reimburse the Company more than once for the same item. We will discuss this point extensively in connection with the Company's claimed "original cost."

—7—

The Company's hypothetical reproduction cost estimate is nearly double the actual legitimate cost of the property, although, as the record shows, the greater part of the property was constructed during the high-price period of 1917-1930.

After full consideration of the estimate of reproduction cost new presented by the Company, we find that it is not predicated upon facts and that it is too conjectural and illusory to be given any weight in these proceedings. See *Railroad Commission v. Pacific Gas & Electric Co.*, 302 U. S. 388, 397; *Re Canadian River Gas Co. et al.*, F. P. C. Op. 73.

The Company also presented a trended "original cost" estimate which exceeded $105,000,000. The objective of that estimate, according to the witness, was to reflect changes in price levels and to indicate what the original cost of the property would have been if 1938 material and labor prices had prevailed throughout the whole period of the piecemeal construction of the Company's property since 1898. At the outset this estimate includes a multi-million dollar error because the trend factors were applied to an inflated "original cost" claim of the Company, which we will discuss fully under the subject of actual legitimate cost. The evidence discloses fundamental errors in the trending process used. No consideration was given by the Company's witness to the great advances in the science of con-

struction and the improvement in the quality of pipe and equipment in the natural gas industry, during the long history of the Company.

Hope Company's own experience demonstrates that

—8—

man-hour productivity has increased greatly throughout the years during which the Company's property was constructed. Yet the Company's witness gave no consideration to that fact, but utilized high 1938 hourly wage-rates to price the slower obsolete construction methods of the past on a time basis. It is undisputed that service qualities of pipe, including increased tensile strength and reduced weight, have been improved in recent years. Pipe is sold on the basis of weight and the heavier and inferior pipe in the Hope System was priced at 1938 prices for modern pipe, in disregard of the known improvements in the product. Another basic defect in the trending was the adoption of the arithmetical average of the cost per ton of smaller sizes of pipe when 95% of the cost of pipe in the Company's transmission lines represented pipe having greater diameters. That such a pipe trend is not representative is obvious. Furthermore, the 1938 prices upon which the trends were based, being representative of only slightly more than 1% of the total plant, furnished no dependable yardstick.

In the light of the evidence the conclusion is inescapable that the Company's trended "original cost" estimate is not founded in fact, but it is basically erroneous and produces irrational results.

The reproduction cost studies and the so-called trended "original cost" studies were the typical, hypothetical conjectures which have plagued rate regulation for more than forty years. The actual development and experience of the Hope Company were ignored. In addition, assumption upon assumption as to material and labor costs, and magni-

fied imagination as to overheads were indulged in lavishly. The results have no probative value and accordingly must be condemned.[6]

The estimates of reproduction cost and trended "original cost" lack reliability, so we turn to the evidence of actual cost of Hope's property.

*Actual Legitimate Cost*

The Company and the Commission's Staff submitted exhibits and supplied testimony on the cost of gas plant used in the Company's interstate service. The Company claimed that cost, as of December 31, 1938, amounted to $69,735,638, the Staff indicated a figure of $51,984,153, while the books disclosed an investment of approximately $52,730,666.[7]

Hope's vouchers, books and records are adequate for examination, analysis and audit. Hope kept complete records of its expenditures throughout its existence, so no estimates are required to ascertain the actual cost.

---

[6] Under the recent decision of the Supreme Court involving the Natural Gas Act in *Federal Power Commission v. Natural Gas Pipeline Co.*, 315 U. S., . . ., and the decision of this Commission in *Re Chicago District Electric Generating Corporation*, 39 P. U. R. (N. S.) 263, involving the companion part of the Federal Power Act, such estimates of reproduction cost and trended "original cost" need not have been admitted in evidence.

[7] The book cost of the interstate facilities is derived as follows:

| | | |
|---|---|---|
| Total Plant Investment per books | | $56,213,454 |
| Less: | | |
| Distribution Property | $2,795,083 | |
| Unfinished Construction | 81,392 | |
| Intangible Plant | 30,186 | |
| Property Used to Transport Coke-oven Gas | 576,127 | 3,482,788 |
| Plant Investment, per books, of Interstate Facilities | | $52,730,666 |

Table A appearing on page 11 compares the cost of facilities used in interstate service as claimed by the Company, as shown by the books of account, and according to our findings, as of December 31, 1938.

*The Company's Estimated "Original Cost"*

The first step in the Company's determination was the taking of an inventory. The inventory units were then priced at estimated cost, including arbitrary overheads. The amounts shown as plant costs by the books were ignored, except for the purpose of aiding in estimating unit costs. As is shown by Table A, the Company's method resulted in a claimed net increase of $17,004,972 over the amount recorded as investment in the interstate properties on its books of account. The Company claims, in other words, that its books fail to show the true cost of such properties in that amount. The items of that amount which are identifiable represent expenditures previously charged to expense accounts. Some of the alleged expenditures were not incurred at all. For example, claimed interest during construction of $632,000 was not actually paid. Obviously, to the extent that the plant costs are understated, if they are, the difference must represent charges to other accounts, particularly expense accounts, in the books.

The claimed additional costs are divisible into two groups—one relating to properties constructed by the Company, and the other relating to property acquired from other utilities. Table B on page 12 shows the general nature of the $17,004,972.

| Wells and Field Lines not in Service | | | 192,150 |
| Total Gas Plant (Exclusive of Distribution Plant and Property used to transport Coke-oven Gas) | $69,735,638 | $52,730,666 | $51,984,153 |

* For comparative purposes the amounts in this column have been classified (without change in the total) in accordance with our Uniform System of Accounts for Natural Gas Companies. The Company's study is on this basis also.

—12—

TABLE B

*Constructed Property*

| | |
|---|---|
| Inventory, Transfer and Correcting Adjustments | $(1,821,581)[8] |
| Direct Material and Labor Costs not Capitalized | 13,580,814 |
| Unloading, Hauling and Warehouse Handling Costs | 383,454 |
| Indirect Field Costs | 396,141 |
| Overhead Costs | 2,866,414 |
| Total Claimed Adjustments to Constructed Property | $15,405,242 |
| Claimed Adjustments to Properties Purchased from Other Utilities | 1,599,730 |
| Total | $17,004,972 |

The Company's cost study was made by an engineering firm. The witness for the Company, a valuation engineer, indicated clearly that he was not concerned with the Company's past practices in determining costs and in determining expenses. To him it was of no concern whether an item had been charged to expense and the cost thereof recouped in rates, or even whether an item represented an expense under the wide discretion of management allowed by accepted principles of accounting. The realities as to past practices and determinations received no consideration. Evidently the object of the study was to determine the maximum cost which could be assigned to the properties under any theory or principle of cost determination, regardless of the fact that the Hope Natural Gas Company had been in business more than forty years and had made determinations in its regular course of business as to which of its expenditures constituted investment in plant and which constituted operating expenses.

The first proposed adjustments to book cost ($1,821,581), reflecting inventory, transfer and correcting adjust-

[8] Parentheses indicate decrease.

—13—

ments, will be discussed hereinafter.

The second adjustment ($13,580,814) represents items previously charged to expense and not capitalized in the books or items which cannot be identified in the books and records and, therefore, may not have been incurred at all. The amount of $13,580,814 may be subdivided as follows:

| | |
|---|---|
| Well Drilling | $11,279,554 |
| Other Direct Material and Labor Cost | 996,543 |
| Labor Costs in Laying Mains, Constructing Compressor Stations, etc., During Years 1918 to 1922, Inclusive | 1,295,953 |
| Leasehold Cost | 8,764 |
| Total | $13,580,814 |

The largest item of claimed additional cost relates to labor and drilling equipment used in drilling wells. The additional amount claimed ($11,279,554) is associated with 2,633 wells. It is the Company's contention that these expenditures, which were charged to operating expenses when incurred, should now be included in the rate base.

It was the consistent practice of the Hope Company up to 1923 to charge the cost of drilling wells to operating expense. This likewise was the general practice of the natural gas industry. It followed the well-established practice of extractive industries of charging items to expense which in less venturesome enterprises were ordinarily charged to the plant account.[9] The theory underlying the practice was that additional wells were constantly needed to keep

—14—

the Company in business, hence the cost incurred was not for the purpose of adding to the property but rather for the purpose of maintaining the business. The evidence

[9] *Re Hope Natural Gas Co.*, 1921 E 418, 439-440; *United States v. Roden Coal Co.*, 39 Fed. (2d) 425; *Marsh Fork Coal Co. v. Lucas*, 42 Fed. (2d) 83; *Commissioner of Internal Revenue v. Brier Hill Collieries*, 50 Fed. (2d) 777.

shows that the Natural Gas Association of America opposed a provision in the first uniform system of accounts for natural gas companies issued by a State commission which required capitalization of well drilling expenditures. That Association took the view that such expenditures were necessary operating expenses. In fact, Hope did not change its practice in this respect until it was required to do so by the provisions of the system of accounts for natural gas companies promulgated by the Public Service Commission of West Virginia, effective in 1923. It is significant that West Virginia's system of accounts did not require and evidently did not permit the Hope Company to reaccount for its past expenditures, but merely required a change as to treatment of well drilling expenditures beginning with its effective date.

The Company's practice of charging well drilling expenditures to operating expenses, therefore, conformed to the principles and practices of the time. One of the obvious purposes of keeping books of account is to inform management so that proper managerial decisions may be made. One of the first functions of management, of course, is to endeavor to fix prices so that revenues will cover operating expenses and yield a profit. Where it is the general practice of the industry to treat certain expenditures as operating expenses, it is manifest that such expenditures will be considered as expenses in its rate negotiations and determinations.

If there were any doubt about this matter, it would be

dispelled by the action of the Hope Company itself. In 1921 the Hope Company was involved in a rate proceeding before the Public Service Commission of West Virginia. It was a proceeding in which Hope sought to increase its rates. In that proceeding the Company claimed well drilling and other expenditures now sought to be included in the rate base, as operating expenses. They were allowed

as such by the Public Service Commission of West Virginia.[10] No further proof is needed to show that Hope considered the expenditures in question as operating rather than plant items, in its efforts to recover full operating costs plus a profit in the conduct of its business.

No greater injustice to consumers could be done than to allow items as operating expenses and at a later date include them in the rate base, thereby placing multiple charges upon the consumers.

The other direct material and labor costs of $996,543 appear, to the extent they can be identified, to have been charged in the past to maintenance and repairs.

The adjustments for cost of labor in laying mains, constructing compressor stations and other property totaling $1,295,953, and the adjustment of $8,764 to the cost of leases are treated later.

In addition to well drilling expenditures, other items now sought to be included in the plant accounts which were previously included in expenses, if they were incurred at all (the Company's method makes it impossible to determine whether or not certain of the expenditures were incurred), are as follows:

—16—

| | |
|---|---|
| Unloading, Hauling and Warehouse Handling Costs | $ 383,454 |
| Indirect Field Costs | 396,141 |
| Other Overhead Costs | 2,866,414 |

As to these items, here again the Company followed a consistent practice, and the practice of the industry, in charging such expenditures to expense accounts. It was not customary for the natural gas industry or other extractive industries to load the plant accounts with overhead items, such as shown above. Even under the relatively definite requirements of the Commission's present Uniform System of Accounts, considerable discretion and latitude

[10] *Re Hope Natural Gas Co.*, P. U. R. 1921 E 418, 433, 439-440.

are allowed management in accounting for overhead expenditures. Accordingly, the allowance of the items mentioned would not represent the correction of past errors, but merely the substitution of present judgment for the judgment exercised at the time the expenditures were incurred, which covered a period of forty years. The important rule is that once discretion has been exercised, subsequent action must be consistent with the decisions previously reached. There is no settled principle controlling the determination of the exact amount of overheads, if any, which should be applied to the cost of plant items.

Besides claiming large additional costs for property constructed by the Company, Hope claims a net sum of $1,599,730 representing alleged additional original cost of property acquired from other utilities. These properties, acquired chiefly from affiliated utilities, were accounted for by Hope at the cost to it, which was the cost to the predecessors. Hope now claims that the costs accounted for as

—17—

plant by the predecessors were in error in that the predecessors followed the same allegedly erroneous practices that Hope followed. It, therefore, claims that well drilling costs in the amount of $1,364,087, other direct material and labor costs of $286,173, unloading, hauling and warehouse handling costs of $18,557, indirect field costs of $38,519, other overhead costs of $122,943, and leasehold costs of $6,388, all of which, if incurred at all, the predecessors had charged to expense, should be added to its plant investment figure and included in the rate base.[11] Since these predecessor companies kept their books and records exactly as did Hope, in accordance with the general practice of the industry, the proposed adjustments, except for leasehold

[11] There were also inventory, transfer and correcting adjustments which decrease the book cost by $236,037, and they are discussed hereinafter.

costs, are in the same category as the items which Hope now attempts to restate in its plant accounts.

In the course of its study, the Hope Company determined that considerable property which was recorded in its plant accounts, was no longer in existence. In other words, there were unrecorded retirements. Offsetting the unrecorded retirements were certain items of existing property for which the Company found no costs in its plant accounts. More than likely, certain of the latter merely represented the failure to identify items which were determined to be unrecorded retirements. The net effect is a substantial adjustment ($1,821,581 for constructed property, and $232,930 and $3,107 for acquired property) for unrecorded retirements and miscellaneous corrections. The adjustment is not controverted and should be made.

—18—

*Impropriety Of Including In Rate Base Items Previously Charged To Expense*

It has been shown that the Company's claim of additional plant cost over and above what is recorded on its books as plant investment represents largely expenditures previously charged to expense in accordance with the discretion of management. The Company, in other words, now impeaches its books and its former financial statements to regulatory bodies, tax authorities, investors, and others. It impeaches the decisions of management made at the time the expenditures were incurred. It does this in spite of the fact that its past decisions conformed to its own consistent practices, until required to change them by a regulatory agency, and to the general practice of the natural gas industry, as well as the extractive industry. The adjustments proposed, therefore, do not reflect the correction of errors in the past. Errors as to these items were not made.

The past determinations of the items constituting plant investment were deliberate, conscious acts on the part of

management at the time of the transactions. A decision obviously must be made when an expenditure occurs as to whether it represents an investment in plant or an expense. There must also be some finality to these decisions.[12] If

—19—

they are treated as expenses at one time and as plant investment subsequently, chaos in rate-making and in corporate finance will prevail. It is no answer that many of the expenditures in question were incurred prior to the effective date of a prescribed uniform system of accounts. The Company kept plant and expense accounts throughout its history and conformed to the general business practices of the industry and like business institutions. It was evidently thoroughly convinced as to the propriety of its decisions; as witness its claim before the West Virginia Commission in 1921, that the very expenditures in question were operating expenses. The Company is now estopped from re-accounting for those expenditures.

With the decline in favor of the doctrine of "fair value" as the only mode of public utility rate regulation, its keystone, reproduction cost, crumbles. Bona fide investment figures now become all important in the regulation of rates. Immediately, however, we find an effort to tamper with these. There is in progress an attempt to make the reproduction cost *process* survive in the determination of actual cost of or investment in plant. Thus, in this case an inventory was taken and then units were priced at the estimated "actual cost." The method should be condemned at

---

[12] Costs of exploration for and development of future gas reserves are considered current operating costs by the industry and Hope has included such costs in its current operating expenses. If retroactive accounting were allowed then the Company might restate these costs as capital investment in the future productive acreage. The Commission will allow $600,000 in annual operating expenses for exploration and development costs in fixing rates. If this item were permitted to be restated in plant cost ten years from now $6,000,000 would be added to the rate base resulting in multiple charges to consumers.

the threshold. For in addition to being permeated with conjectural estimates, it gives no heed to the realities of past events. Consistent treatment of expenses and plant investment costs is indispensable to the successful operation of the regulatory system.

This is not to say that genuine errors in the investment accounts should not be corrected and the true figures

—20—

given recognition in the rate base. Where real errors are made, they probably should be corrected. A distinction must be made, however, between genuine errors and a change in point of view, whereby past, deliberate decisions within the scope of an accepted principle are sought to be impeached to the pecuniary benefit of the Company.

The courts and commissions which have considered this matter have generally refused to include in the rate base amounts previously charged to expense in accordance with discretion of management. In the instant case, large parts of the claimed additions to book costs relate to well drilling expenditures and alleged overheads. The very question at issue has been passed upon twice by the Supreme Court of Appeals of West Virginia. In the first case in 1924, the Natural Gas Company of West Virginia sought to include such expenditures in the rate base after they had been charged to expense. The Public Service Commission of West Virginia refused to allow them. The Supreme Court of Appeals sustained the Commission.[13] The question was raised again in 1934 by the Natural Gas Company of West Virginia. The Public Service Commission of West Virginia then concluded that the inclusion of such expenditures in the rate base was required as a matter of law. The City of Wheeling, West Virginia, appealed the Commission's decision. The Court reversed the Commission and

---

[13] *Natural Gas Company v. Public Service Commission*, 95 W. Va., 557, 121 S. E. 716, 720, P. U. R. 1924 D 346, 361.

again held that items previously charged to operating expenses should not be included in the rate base.[14]

—21—

Thus, by far the weight of authority in court and commission decisions sustains the principle, sound in equity and justice, that items previously charged to operating expenses under the allowable discretion of management should not later be included in the base on which customers are required to pay a return and depletion and depreciation allowances.[15]

The Hope Company's earnings over the years have been ample to provide for all operating expenses, including the $17,800,000 which it attempts to add to actual cost, an excessive reserve for depletion and depreciation, taxes, and large returns to investors. During the period 1898 to 1923 for which the Company seeks to re-account and expand its recorded plant costs by approximately $12,600,000 for well drilling costs alone, the average rate of earnings on the annual average invested capital (capital stock and surplus) was more than 15%.

*Actual Legitimate Cost Or*
*Gross Plant Investment*

Accordingly, we begin with the book cost in the determination of the actual legitimate cost or investment in the facilities used in the Company's interstate business. We

S.) 177, 196-8, aff. 373 Ill. 31, 25 N. E. (2d) 482, 493, 31 P. U. R. (N. S.) 193, 207, app. dis. 309 U. S. 634; *Re West Virginia Central Gas Co.*, P. U. R. 1918 C, 453, 464-6; *Re Mondovi Telephone Co.*, P. U. R. 1933 B, 319, 321-3; See *Re Northwestern Electric Co.*, 36 P. U. R. (N. S.) 202, 208-213, aff. 125 Fed. (2d) 882; *Re Canadian River Gas Co., et al.*, F. P. C. Op. 73; cf. *Chicago & N. W. R. Co. v. Com'r. Int. Rev.*, 114 Fed. (2d) 882, 886, cert. den. 312 U. S. 692.

have already found that such book cost at the end of 1938 amounted to $53,730,666. There must be deducted from the

—22—

book cost the unrecorded retirements, or inventory adjustments in the amount of $2,057,618. There is added to the book cost the amount of $15,152 ($8,764 for constructed property and $6,388 for acquired property) representing adjustments due to errors in stating the cost of leases, and an amount of $1,295,953, representing plant costs properly capitalized and then arbitrarily charged off to operating expenses.

There is considerable question as to whether the latter amount should be restored to book cost in determining the rate base. The amount arises as follows. From 1918 to 1923 Hope followed the peculiar practice of capitalizing the cost of direct labor incurred in laying pipe lines, constructing compressor stations and in installing equipment, but at the end of each year, arbitrarily charged off the amount thus capitalized during the year. This practice was peculiar to the Hope Company and was not a general practice of the industry. It did not conform to sound accounting principles. Hope followed the correct practice during all of its existence except for the few years mentioned. Under the circumstances, the amount is restored to the investment figure and is allowed in the rate base. The allowance in this instance, however, is not to be construed as a precedent.

As of December 31, 1938, the cost of unoperated acreage ($584,382) and the cost of certain wells and field lines ($192,150) then not in service were contained in the accounts. These items are eliminated from gas plant in service as of December 31, 1938, and appropriate adjustments for the use of such property and facilities are made subsequently.

—23—

After considering the evidence based upon the vouchers, books and records of the Company, and as a result of

the application of fundamental principles of accounting, cost determination and equity, the Commission finds, in the words of Section 6(a) of the Act, the actual legitimate cost as of December 31, 1938 in plant used in the interstate business was $51,207,621, composed as follows:

| | |
|---|---|
| Book Cost 12/31/38 | $52,730,666 |
| Less Inventory adjustments (unrecorded retirements) | 2,057,618 |
| Less Wells and Field Lines Not in Service | 192,150 |
| Less Unoperated Acreage | 584,382 |
| Sub-total | 49,896,516 |
| Plus Correction to Cost of Leases | 15,152 |
| Plus Capitalized Costs Charged Off in Error | 1,295,953 |
| Actual Legitimate Cost of Plant in Interstate Service | $51,207,621 |

There were more retirements than additions in 1939, so the actual legitimate cost was $51,099,024 at the end of 1939. The record shows net additions of $965,533 in 1940 to produce a total actual legitimate cost of $52,064,557. Certain inactive wells with the connected field lines became active in 1940 and the cost of this property is $110,316. We find that the actual legitimate cost, including such currently used property, aggregates $52,174,873 as of December 31, 1940.

This actual legitimate cost is predicated upon facts and it is the best evidence in these proceedings, so we will employ it for determining the proper and allowable rate base.

—24—

*Depletion and Depreciation*

In determining the allowable rate base in these proceedings the actual existing depletion and depreciation should be deducted from the actual legitimate cost of the property devoted to the interstate service. See *Los Angeles Gas & Electric Corp. v. R. R. Comm.*, 289 U. S. 287,

312. Actual existing depletion and depreciation is the extent to which the service life, that is the economic life, of the property has been consumed due to such forces as exhaustion of the natural gas supply, wear, inadequacy, and obsolescence.[16] Annual depletion and depreciation measure the economic service life consumed in one year, actual existing depletion and depreciation are the accrued consumption of the utility's economic service life on a certain date; the annual allowance for depletion and depreciation must, therefore, be correlated with the actual existing amount to avoid injustice to the utility or rate payer. *Re Canadian River Gas Co., et al.*, F. P. C. Op. 73; *Re Chicago District Electric Generating Corp.*, 39 P. U. R. (N. S.) 263, 275; *Re Interstate Power Co.*, 32 P. U. R. (N. S.) 1, 10.

The Company presented inconsistent claims in this respect. It alleged a relatively small amount of accrued or existing depletion and depreciation to be deducted in fixing the rate base, but claimed large annual amounts for future operating expenses.

The Company contends that the accrued depletion and depreciation in its property equaled approximately 35%

of the reproduction cost at the end of 1938. We have weighed the estimate of reproduction cost and found it wanting. In addition, it is inequitable to predicate depletion and depreciation upon the delusive reproduction cost. The integrity of the investment will be maintained by basing depletion and depreciation upon actual legitimate cost and the Supreme Court has approved that method.[17]

---

[16] *Lindheimer v. Illinois Bell Tel. Co.*, 292 U. S. 151, 167; *Re Canadian River Gas Co., et al.*, F. P. C. Op. 73; cf. *Depreciation Charges of Telephone and Steam Railroad Companies*, 177 I. C. C. 351, 408, 422.

[17] *Lindheimer v. Illinois Bell Tel. Co.*, 292 U. S. 151, 167-9, 176; *Federal Power Commission v. Natural Gas Pipeline Co.*, 315 U. S. .....

The Company determined accrued depreciation primarily by the observation process and obtained what is called a "per cent condition" of the property. For annual expense purposes, it weighted the observed depreciation with retirement of property up to the date of the study. The fallacy of the "per cent condition" theory of accrued depreciation is plain here. To illustrate, under the hypothesis of the Company's witness, in determining the "per cent condition" of certain compressor station equipment, the property would be found to have depreciated only 25% throughout its life or be in 75 "per cent condition," and then suffer a precipitous loss in the brief final stage of service. Such a theory is opposed by reason and facts. *Los Angeles v. Southern California Telephone Co.*, 14 P. U. R. (N. S.) 252, 273-4. The Company's estimate of existing depreciation was based primarily upon a sporadic visual inspection of physical deterioration. Most of Hope's production and transmission property is not visible and the extent to which the service life has been consumed can not be determined from observation alone. Also, the functional

—26—

causes of the retirement of property are given little consideration by the Company's visual method which samples physical causes. *Re Rochester Gas & Electric Corp.*, 33 P. U. R. (N. S.) 393, 468-490. The Commission concludes that the so-called accrued depletion and depreciation claimed by the Company does not give full or proper consideration to all factors contributing to the retirement of property, and that it does not reflect the actual existing depletion and depreciation or diminished service life of the property in service.

*The Required Reserve For Depletion and Depreciation*

The same factors that cause annual depletion and depreciation cause the actual existing depletion and depreciation to be deducted from the property in fixing the rate base. In our opinion, where reasonable and proper depletion and depreciation accounting practices have been observed by a natural gas company, the resulting reserve is the best measure of the depletion and depreciation existing in the property, i.e., the accumulated cost of property which has been consumed in service.

It is well known that many electric and gas utilities have not observed sound depreciation and depletion practices. The Hope Company is in this category. For many years most of Hope's business was not under regulation. Its practices as to depreciation and depletion, like the practices of many other utilities, were inconsistent and haphazard. Its book reserve does not measure the actual existing depreciation and depletion.

This Company has actually accumulated an excessive reserve. We are confronted, therefore, with the question

—27—

as to whether that excessive reserve, or the reserve requirement (actual existing depreciation and depletion), should be deducted in determining the rate base.[18] We have formerly indicated that public utilities ought to set up proper depreciation (and depletion) expense and that the resulting reserve should be deducted from the gross cost in the rate base determination.[19] We reiterate that view.

---

[18] There are those who argue that excessive reserves should be deducted. *Pennsylvania Public Utility Comm. v. The Peoples Natural Gas Co.*, Nos. 11380, 12683 (1942), Buchanan, dissenting; See *Chesapeake & Potomac Tel. Co. v. Whitman*, 3 Fed. (2d) 938, 951-953; *New York Telephone Co. v. Prendergast*, 36 Fed. (2d) 54, 66.

[19] *Re Interstate Power Co.*, 32 P. U. R. (N. S.) 1, 10; *Re Chicago District Electric Generating Corp.*, 39 P. U. R. (N. S.) 263, 275.

We believe, however, that under such circumstances as exist in this case, where a large part of the Company's business is brought under regulation for the first time and where incorrect depreciation and depletion practices have prevailed, the best procedure is to deduct the reserve requirement in computing the rate base. This procedure will permit us to be consistent in those cases where utilities have deliberately failed to observe sound practices and as a result have deficient reserves. Thus, in the Interstate Power Company case, where the company had been negligent in accounting for depreciation and had a deficient reserve, we deducted the higher reserve requirement, as the measure of actual existing depreciation.

It should be borne in mind, however, that the deduction of the reserve requirement, rather than the actual book reserve, is for the purpose of getting a sound basis for

future regulation and control of rates. Hereafter, the Company, in accordance with this Opinion and under our System of Accounts, is required to record proper depreciation and depletion expense. Hence, the books of this Company, as well as the books of others subject to our jurisdiction, after once having the reserve requirement determined, should reflect in substantial degree the proper depreciation and depletion. Use of the reserve requirement in this case will produce a proper starting figure so that the book reserve can be deducted hereafter as the proper measure of the actual depreciation and depletion. This treatment will then be consistent with the view that the book reserve is the proper deduction from the gross cost in determining the rate base.

It becomes necessary, therefore, to ascertain the best measure of the reserve requirement. The purpose of depletion and depreciation accounting is to offset diminution

in service value[20] of property being used in service, and to determine as accurately as possible another element of the cost of service for a particular period. All of Hope's physical property, except certain land, will be depleted or depreciated completely when it reaches the end of its useful or economic life. Physical and functional forces, whether their effects are visible or not, are constantly reducing the service life of the Company's property. Service life is the equivalent of economic life or the utility of the property.

—29—

Hope incurs plant costs to provide for future service and to make production possible. As natural gas service is rendered the economic value of property is gradually consumed, and the property is finally retired at the end of its service life. The cost of the property consumed annually in rendering that service should be charged to operating expenses to reflect the depletion and depreciation incurred.

The Commission's Staff presented a depletion and depreciation reserve requirement study in these proceedings. Estimates were made of the over-all service lives of the properties by classes; those average service lives were converted into depreciation rates, and then applied to the cost of properties to determine the portion of the cost which had expired, that is, which related to the consumed service lives. The study covers the operations of the Company from its beginning in 1898 to December 31, 1940. It shows annual amounts for each group of property from the date installed to the date of retirement, and it concurrently provides the necessary reserves for property retired and for the ultimate retirement of existing property. The fundamental principle that annual expense for depletion and depreciation must be harmonized with accrued depletion and depre-

[20] "Service value." is the difference between original cost and the net salvage value of gas plant. Depletion and depreciation signify the consumption of service life of property and when that is translated into dollars it shows the loss in service value.

ciation has been applied here. The straight-line service life method was used to compute the reserve requirement for all of the material, equipment and structures of the Company, and the unit-of-production method was applied to plant costs which are associated with the gas supply, i.e., gas producing lands and leases, field line and gas well con-

—30—

struction; rights-of-way, and costs of abandoning gas wells.[21] The service life study was made by a properly qualified Staff engineer who analyzed Hope's past experience, including the retirement of property over the years. He gave consideration to relevant service life data on other pipe lines. He also considered the functional and physical aspects of depreciation. As an aid in the determination of service lives he made a field inspection of the Company's physical properties. The unit-of-production method used by the Staff was related to the gas reserves of the active wells of the Company. This case is free from the usual complexities involved in the estimate of gas reserves because the geologists for the Company and the Commission presented estimates of the remaining recoverable gas reserves which were about one per cent apart. The permeability and porosity characteristics of the region cause isolated pools of natural gas, and the Company's gas production properties are intermingled with non-productive areas and other companies' properties. This situation necessitated the segregation of Hope's property into gas producing areas for the depletion and depreciation reserve requirement study. Gas rights, well construction and connected field line construction costs are consumed in service proportionately with the depletion of the associated gas supply. Well equipment and field pipe line material are recovered and used again when the various sources of gas supply are exhausted. These facts of operation have been

[21] As defined in the Uniform System of Accounts.

recognized in the ascertainment of the required reserve for depletion and depreciation.

—31—

The Staff recommended the depletion and depreciation reserve requirement for Hope's production, transmission and general plant in the amount of $23,520,561 as of December 31, 1940.[32] After a careful analysis of the evidence we have accepted certain adjustments advocated by the Company and find that the depreciation and depletion reserve should be not less than $22,328,016 as of December 31, 1940. These adjustments are as follows: (1) Due to the plant inventory adjustment made by the Company, as of December 31, 1938, and accepted by all parties, a net reduction in the plant accounts was made which represents property retired prior to December 31, 1938, but not so recorded on the books. The Company contends that 10 years is a fair approximation of the average period by which these retirements have been accumulating, hence the depreciation provisions should be reduced for the 10-year period. Had the retirements been made on the books as soon as the property was retired the depreciation base would be reduced and the annual provisions would be less. It is impossible to determine the actual dates the property was retired and we accept the 10-year period as a reasonable estimate of the average time from the date the property was retired to December 31, 1938. This adjustment results in a reduction of $31,106 in annual depreciation expense for each year and

—32—

a reduction of $311,060 in the reserve requirement as of December 31, 1938. (2) In the case of lines lifted, Hope has

[32] That recommended required reserve is after a deduction of $1,162,710 for cost of abandoning property. The depreciation rates used in the reserve requirement study make proper provisions for the inevitable cost of abandoning property. But during the period 1898-1931 Hope charged the cost of abandoning property to maintenance expense, rather than to the depreciation reserve as a part of the net salvage.

usually retired labor cost and charged it to the depreciation reserve. But in the case of pipe retired in connection with a replacement the original labor was not always retired and the renewal labor was charged to operating expense. The depreciation rates applied by the Staff include provisions for the retirement of all labor and materials, hence its reserve requirement computation includes accruals for construction labor cost on the main pipe lines which has been retired and not charged to the depreciation reserve. The Company has estimated an amount of $272,693 representing the additional retirements of labor cost which we will allow as a reduction in the reserve requirement. (3) The group depreciation rate of 2.5% employed by the Staff in its study should be reduced to 2.22% for gas well equipment. As revised the rate for gas well material is the same as for field line material, although the evidence indicates that a somewhat shorter average life has been experienced for gas well material than for field line material. At the rate of 2.22% the annual depreciation expense will be reduced $21,110 for 1939 and $20,911 for 1940. Consistent with the reduction in the annual depreciation expense the reserve requirement at the end of 1938, 1939 and 1940 will be reduced $566,771,[23] $587,881, and $608,792, respectively.

The first two of the above-mentioned adjustments are the result of certain accounting practices of Hope prior to

—33—

December 31, 1938 and do not affect depreciation expense for the years subsequent to that date. The reserve requirement which the Commission finds to be reasonable and proper is summarized as follows:

---

[23] Total provisions from 1898 to 1938, inclusive, amount to $5,060,456 at a 2.5% depreciation rate and $4,493,685 at a 2.22% depreciation rate for gas well equipment.

*Depletion and Depreciation Reserve Requirement*

| | Dec. 31, 1938 | Dec. 31, 1939 | Dec. 31, 1940 |
|---|---|---|---|
| Amount Computed by Staff | $23,501,356 | $24,072,167 | $24,683,271 |
| Less Staff Adjustment for Cost of Abandoning Property | 1,162,710 | 1,162,710 | 1,162,710 |
| Amount Recommended by Staff | 22,338,646 | 22,909,457 | 23,520,561 |
| Less: Unrecorded Retirements | 311,060 | 311,060 | 311,060 |
| Unretired Labor on Transmission Line Replacements | 272,693 | 272,693 | 272,693 |
| Change in Depreciation Rate for Gas Well Equipment | 566,771 | 587,881 | 608,792 |
| Total Adjustments | 1,150,524 | 1,171,634 | 1,192,545 |
| Required Depreciation and Depletion Reserve | $21,188,122 | $21,737,823 | $22,328,016 |

The required depletion and depreciation reserve, as we have determined it upon the record, is the best evidence of the measure of actual existing depletion and depreciation, and it will be deducted from the actual legitimate cost of the Company's property for rate-making.[24] The reserve requirement on any selected date is the total of the annual provisions for depletion and depreciation less the actual retirements of property. The method used here determines the amount required annually to reimburse the Company for property consumed in service, and it results in a cor-

—34—

relation of the annual expense and the accumulated reserve. The method is just and consistent for each operating period because the costs utilized are matched with the revenues produced by the property in service.

---

[24] See *Re Long Island Lighting Co.*, 18 P. U. R. (N. S.) 65, 146-151 189-191; aff. 249 App. Div. 918, 292 N. Y. S. 807, 809, 18 P. U. R. (N. S.) 225, 226; *Re Rochester Gas & Electric Corp.*, 33 P. U. R. (N. S.) 393, 489, 502-3; National Association of Railroad and Utilities Commissioners, Proceedings of Fiftieth Annual Convention (1938) pp. 473-4.

As we have noted, the Company has built up an excessive reserve by charging large annual allowances for depletion and depreciation to operating expenses in the past.

The book reserve for interstate plant at the end of 1938 amounted to about $39,000,000 which is $18,000,000 in excess of the amount we determined as the reserve requirement. In addition, twice in the past the Company has transferred amounts aggregating $7,500,000 from the depreciation and depletion reserve to surplus. When these latter adjustments are taken into account, the excess becomes $25,500,000, which has been exacted from the rate payers over and above the amount required to cover the consumption of property in the service rendered and thus to keep the investment unimpaired. *Lindheimer v. Illinois Bell Tel. Co.*, 292 U. S. 151, 169, 174.

*Estimated Additional Fixed Capital Expenditures*

To make the rate base figures current, the Company presented an estimate of $8,956,500 in "capital expenditures" which it planned for production, transmission and general plant during 1941, 1942 and 1943. Obviously these proposed gross additions should increase the allowable rate base only to the extent that net actual legitimate cost will be increased. Also, $1,270,000 was estimated for 1943 additions to meet the demands of new or increased business.

—35—

The Commission has not given direct effect to those expected 1943 additional revenues in the forecast of revenues for rate-making, so that $1,270,000 will not be included in the rate base. The determination of the estimated increase in net plant cost requires the consideration of additions and retirements of plant and the effect on the depletion and depreciation reserve of future accruals and retirements. Giving due weight to all these factors the increased

net actual legitimate cost, averaged for the period 1941-1943, is $1,392,021.[25]

The Company presented a general plan which it has for the construction of a pipe line from West Virginia to Louisiana to supplement its present source of supply of gas and to meet predictable increased demands for natural gas. Due mainly to the shortage of materials caused by this war, the status of that proposed line is so uncertain that it need not be considered in these proceedings. When the proposed line is constructed and definite information is presented concerning its effect on the rate base and net income, the Commission will give the matter timely and

appropriate consideration.

*Other Used and Useful Property*

The Company's geologist grouped the unoperated acreage[26] into three classes: (1) protective acreage within a mile of producing wells comprised 64%; (2) prospective

---

[25] Estimated Fixed Capital Expenditures 1941-1943 $8,956,500
Less: Expenditures in Expectation of New or Increased Business $1,270,000
Gross Property Retirements 2,700,000 3,970,000
Estimated Net Change in Plant 4,986,500
Deduct: Estimated Net Change in Depletion and Depreciation Reserve—Depletion and Depreciation Accruals 1941, 1942, 1943 4,362,500
Less: Retirement Losses Chargeable against Reserve 2,160,042 2,202,458
Estimated Increase in Net Actual Legitimate Cost $2,784,042
Average for the period ($2,784,042 ÷ 2) $1,392,021

[26] Operated gas acreage is any acreage that is being drained by producing gas wells and all other acreage is considered as unoperated. Hope has held less than two unoperated acres to one operated acre during the last ten years.

acreage for shallow-sand production within three miles of producing wells comprised 14%; and (3) prospective acreage for deep-sand production within three miles of producing wells comprised the remaining 22%. The total unoperated acreage as of December 31, 1940, was 539,285 acres. The Company has undertaken an extensive drilling program, including deep-test wells, and it is a reasonable expectation that within a few years nearly all of this unoperated acreage will become productive, or will be proved unproductive and cancelled. There is no evidence that Hope has acquired large blocks of unoperated acreage to obtain a monopoly on the source of supply, and there is evidence that all of its unoperated acreage is necessary and useful, or imminently useful, in rendering gas service. The cost of unoperated acreage will be included in the rate base. The Commission finds that the actual legitimate cost of unoperated acreage was $584,382 as of December 31, 1938, $567,152 for the end of 1939, and $566,105 as of December 31, 1940.

*Materials and Supplies Plus Cash Working Capital*

There is no controversy over the amount of materials

—37—

and supplies required by the Company. The monthly average of materials and supplies on hand is the most accurate measure of the Company's requirements. The Commission finds that $1,228,599 is the necessary average amount for materials and supplies in 1939, 1940 and the future. This is sufficient, on the average, to meet requirements for more than a year.

A witness for the Company used a period of 45 days as the lag in the receipt of revenues. He stated that 45 days of operating expenses, including gas purchased, would measure the cash working capital required by the Company on a practical operating basis and he computed the amount to be $1,754,008.

A period of 45 days is ample to measure the amount of cash required for payment of operating expenses. Cost of gas purchased must be excluded from the computation because revenues from gas sales are received before the payment for purchased gas is due. The Company has approximately $500,000 on hand at all times representing taxes which are not paid until many months after they are accrued and these tax funds are available for bank balances and working capital requirements. The Commission will allow cash working capital in the amount of $871,407 for 1939 and $896,401 for 1940. This is the maximum allowable amount computed on 45 days of operating expenses, excluding cost of gas purchased, and allowing prepaid expenses in full.

The Commission finds that $2,100,000 was required for materials and supplies and cash working capital in 1939, and that $2,125,000 was necessary for 1940 and will be ade-

quate for the future.

*Conclusions With Respect to the Rate Base*

There is a further matter with respect to plant investment which the Commission will consider before making the final determination of the rate base. Prior to January 1, 1939, the Company charged all administrative and general costs to operating expense. Beginning January 1, 1939, the Company tentatively adopted the practice of capitalizing a portion of its administrative and general expenses. This discretion by the management is permissible under the Commission's Uniform System of Accounts. This tentative capitalization of administrative and general expenses was reconsidered by the Company and it has informed the Commission that it wishes to resume the regular practice of including all general and administrative costs in operating expenses. This change in the tentative accounting policy is reflected in the verified annual report for

1941 filed with this Commission. The amounts of $79,439 for 1939 and $138,018 for 1940 are removed from plant costs and included in operating expense for the respective years. Theoretically, adjustments to annual depreciation expense and to the reserve requirement should be made on account of the foregoing, but the amounts are so insignificant in a case of this magnitude that no inequity will result from not making them.

The analysis of the evidence which we have discussed with respect to the components of the rate base and our conclusions may be summarized thus:

—30—

| | Dec. 31, 1938 | Dec. 31, 1939 | Dec. 31, 1940 | Future |
|---|---|---|---|---|
| Gross Investment in Gas Plant in Service (Exclusive of Distribution Plant, and Property Used to Transport Coke-oven Gas) | $51,207,621 | $51,019,585 | $51,957,416 | $51,957,4[illegible] |
| Less: Actual Existing Depletion and Depreciation | 21,188,122 | 21,737,823 | 22,328,016 | 22,328,0[illegible] |
| Net Investment | 30,019,499 | 29,281,762 | 29,629,400 | 29,629,4[illegible] |
| Add: Net Capital Additions 1941, 1942, 1943 | | | | 1,392,0[illegible] |
| Useful Unoperated Acreage | 584,382 | 567,152 | 566,105 | 566,1[illegible] |
| Working Capital | 2,100,000 | 2,100,000 | 2,125,000 | 2,125,0[illegible] |
| Interstate Rate Base | $32,703,881 | $31,948,914 | $32,320,505 | $33,712,5[illegible] |

The Commission, therefore, adopts the foregoing amounts as the interstate rate base for the dates indicated, for the Company's property assembled as a whole and doing business as part of an integrated system. The Commission finds that the rate base for 1939 was the average of the rate base amounts at the beginning and the end of that year or $32,326,398, that the rate base for 1940 was the average of the rate base amounts at the beginning and the end of that year or $32,134,710, and that the rate base for fixing future rates is $33,712,526.

—40—

## OPERATING REVENUES AND EXPENSES

For rate-making purposes the Commission has given consideration to the actual operating revenues and expenses of the Company for 1937-1940, inclusive, and has also considered the income statements since 1898. In testing the reasonableness of existing rates the latest experience of the Company, as disclosed by the record, is the closest reflection of the present and future operations.

### *Interstate Gas Service Revenues*

There is no controversy over the volume of gas sold or the revenues received by Hope. The Commission finds that during the years 1939 and 1940 the interstate gas sales to the five customer companies were as follows:

| | 1939 | | 1940 | |
|---|---|---|---|---|
| | M.c.f. billed | Revenues | M.c.f. billed | Revenues |
| East Ohio Gas Company | 33,907,672 | $12,359,500 | 40,376,091 | $14,726,736 |
| Peoples Natural Gas Company | 3,864,304 | 1,371,757 | 9,738,612 | 3,437,207 |
| River Gas Company | 237,640 | 83,174 | 388,750 | 136,063 |
| Fayette County Gas Company | 840,398 | 264,725 | 859,106 | 270,618 |
| Manufacturers Light and Heat Company | 2,500,755 | 787,738 | 2,241,684 | 706,131 |
| | 41,350,569 | $14,866,894 | 53,604,243 | $19,296,755 |

### *Interstate Operating Expenses*

The Commission has considered the Company's operating expenses as recorded on its books, as claimed for rate-case purposes, and as recommended by the Staff. The subsequently discussed adjustments to the Company's operating expenses are made to the amounts as actually recorded

—41—

on its books for the years 1939 and 1940.

### *Depletion and Depreciation Expenses*

The annual allowance for depletion and depreciation included in operating expenses is determined by the same

rates and methods used to determine the depletion and depreciation actually existing in plant.

The Commission finds that $392,500 for 1939 and $624,440 for 1940 is the proper allowance for depletion expense. The present and prospective demands upon the production system indicate that production for the year 1940 is the proper guide for future depletion expense and we will allow $624,440 as the average cost of depletion in our determination of the cost of service. (Depletion expense is computed on the unit-of-production, hence it varies with the actual production of gas.)

The record shows that Hope Company's annual depreciation expense has remained relatively stable, the proper amounts for 1939 and 1940 being as follows:[27]

| | 1939 | 1940 |
|---|---|---|
| Production Plant | $351,811 | $349,676 |
| Transmission Plant | 460,267 | 460,245 |
| General Plant | 25,725 | 25,676 |
| Total Depreciation Expense | $837,803 | $835,597 |

[27] Determined by applying the following straight-line depreciation rates to the average depreciable investment for the year:

| | Rate |
|---|---|
| *Production Plant:* | |
| Structures | 4.17% |
| Field Line, Material, Meas. & Reg. Station Equipment | 2.22% |
| Gas Well Equipment | 2.22% |
| *Transmission Plant:* | |
| Main Lines, Rights-of-Way and Meas. & Reg. Station Equipment | 1.56% |
| Structures | 2.50% |
| Compressor Station Equipment | 2.56% |
| *General Plant:* | |
| Structures | 2.17% |
| Office Furniture & Equip. | 4.00% |
| Other Equipment | 3.57% |
| Communication Equipment | 3.85% |

The Commission finds that the annual depletion and depreciation allowance required for future operating expenses is $1,460,037.

*Exploration and Development Costs*

Section 14(b) of the Natural Gas Act authorizes the Commission to determine the "propriety and reasonableness of the inclusion in operating expenses, capital, or surplus of all delay rentals or other forms of rental or compensation for unoperated lands and leases." Delay rentals paid periodically on natural gas lands to reserve the gas rights for a future supply of gas are included in exploration and development costs. The other costs included are those associated with the drilling of non-productive wells, the abandonment of non-productive leases and the abandonment of projects on which preliminary expenditures were made to determine the gas prospects of available acreage.

The Hope Company, like other companies in the natural gas industry, has followed the conservative practice of charging all exploration and development costs to operating expenses. Exploration and development costs are necessary to replenish the Company's gas supply in order to maintain continued gas service. The Commission has included Hope's gas producing acreage and its useful unoperated acreage at cost in the rate base. The annual depletion allowance is based upon the actual legitimate cost of gas producing leases so there is no margin in that annual allowance to cover exploration and development costs. In fairness to the investors and the rate payers the Commission will make an allowance for delay rentals related to the unoperated acreage and the other exploration and development costs in operating expenses. Hope incorrectly stated the cost of abandoned and surrendered leases in 1939 and

—43—

1940 and we find that the cost of leases abandoned should be included in exploration and development costs in the respective amounts of $45,164 for 1939 and $12,422 for 1940. The Company's exploration and development costs were $500,344 in 1939 and $407,920 in 1940. In view of the Company's extensive program for drilling wells in the next few years and its recent experience with respect to exploration and development costs, the Commission finds that the proper and reasonable future annual allowance for such costs is $600,000 for rate-making purposes.

*Reclassification and Rate Case Expenses*

The Hope Company presented evidence to show that it has spent $675,000 in making reclassification studies in order to comply with the recent Systems of Accounts prescribed by the West Virginia Commission and the Federal Power Commission. The Company also showed expenditures totaling $825,000 as its expenses in this rate case. A contention is made by the Company that it should be allowed an interest rate of 8% on the "unamortized balance" of its reclassification and rate case expenses. In fact, however, the Company has charged all these costs to operating expenses as they were incurred during the years 1938-1941 and the rate payers have already paid enough to reimburse the Company. The Company's interstate wholesale rates have been excessive for several years and the unusually large amount of rate case expenses would ordinarily prompt the Commission to disallow any such expenses to be amortized in the future under the rates the Commission will prescribe because it results in a duplica-

—44—

tion of charges. But in view of the Supreme Court's statement that even where rates in effect are excessive the utility should be allowed its reasonable expenses for presenting its side to the Commission, the Commission con-

cludes that the rate case expenses and the reclassification expenses, totaling $1,500,000 should be spread over a 10-year period beginning January 1, 1939, by the inclusion of $150,000 annually in operating expenses.[28] The Company has charged rate case and property reclassification expenses to operating expenses as incurred in the amounts of $543,121 for 1939 and $624,041 for 1940. Those amounts will be eliminated from operating expenses for rate-making, and the allowance of $150,000 annually for ten years will be made instead.

*Affiliate's Excess Profits From Processing Hope Company's Gas*

Hope Construction & Refining Company, an affiliate, extracts gasoline and other by-products from the natural gas of Hope Natural Gas Company. The extraction of gasoline and butane is profitable and is necessary to make the natural gas marketable and transportable. The process of extracting gasoline and butane reduces the heating value of the natural gas and consumes a certain volume of Hope's natural gas, thus imposing a burden upon the gas business.[29] Much of the gasoline extracted from Hope's natural gas has been sold to the Standard Oil Company at about one-half the price received from sales to others. It is sig-

—45—

nificant that the Hope Natural Gas Company processed its own gas before 1920. The natural gas customers are entitled to be credited with a share of the profit from the processing of Hope's gas, even as they would pay the deficit if that essential processing were not profitable. It is agreed that it is proper to make a credit for a portion of the profits realized by Hope Construction & Refining Com-

[28] *Driscoll v. Edison Light & Power Co.*, 307 U. S. 104, 120-121.

[29] *Re Hope Natural Gas Co.*, P. U. R. 1921E 418, 428-430.

pany from the processing of Hope's gas, but there is a dispute over the amount of the credit. The Commission concludes that the credit proposed by the Company, being a royalty of 1/4 of the gross earnings from the gasoline and butane extracted, is not supported by sufficient evidence. The excess profits of the affiliated company above the cost of processing Hope's gas and a fair rate of return on its investment is the proper credit to Hope Natural Gas Company. See *United Fuel Gas Co. v. Comm'n*, 278 U. S. 300, 319-321; *Dayton Power & Light Co. v. Comm'n*, 292 U. S. 290, 295. The cost of processing Hope's gas includes all of the affiliated company's related operating expenses, including depreciation expense, taxes, and a liberal 6½% rate of return on the net investment, plus working capital, devoted to the processing function. The affiliated company's extraction plants are usually located near Hope's compressor stations. The Commission finds that Hope should have received payments of $117,641 in 1939 and $119,592 in 1940 for the steam and boiler fuel which it furnished its affiliate at the extraction plants, and that the gas vapors which are returned to Hope after processing belong to Hope as part of its natural gas. From the record we

—46—

find that Hope Construction & Refining Company had the following average net investment and required working capital devoted to processing Hope's natural gas:

| | 1939 | 1940 |
|---|---|---|
| Gross Investment | $1,716,145 | $1,696,510 |
| Depreciation Reserve Requirement | 1,208,739 | 1,260,312 |
| Net Investment | 507,406 | 436,198 |
| Working Capital | 80,000 | 80,000 |
| Average Net Investment | $ 587,406 | $ 516,198 |

The Commission finds that Hope's affiliate has earnings from the processing of gas in excess of a fair return and that these excess profits are applicable as reductions

of Hope's operating expenses. For 1939 and 1940 these excess profits are determined as follows:

| | 1939 | 1940 |
|---|---|---|
| Gasoline and Butane Revenues | $791,451 | $770,028 |
| Related Operating Expenses | 518,394 | 551,370 |
| Net Processing Income | 273,057 | 218,658 |
| Return at 6½% on Net Investment Plus Working Capital | 38,181 | 33,553 |
| Excess Profits | $234,876 | $185,105 |

In prescribing future rates the affiliate's excess profits for 1940 will be employed as a conservative measure of Hope's portion of the profits from the gasoline and butane extracted from its gas.

—47—

*Other Adjustments to Operating Expenses*

Hope furnishes management services to several affiliated companies at cost, and credits the proceeds to miscellaneous gas revenues thereby permitting the cost of those services to others to remain in its operating expenses. The Commission, therefore, finds that operating expenses should be reduced $192,415 for 1939 and $109,194 for 1940 for the cost of services billed to others in order to reflect actual net operating expenses.

Hope furnishes natural gas to Hope Construction & Refining Company for use in repressuring oil wells. The gas is returned to Hope's system at reduced pressures. An amount of 2½¢ per m.c.f. is regarded as the cost of recompressing the natural gas returned to the Hope Company. Hope records these transactions as sales and purchases of natural gas and that practice overstates both revenues and expenses. The Commission finds that operating expenses and revenues should be reduced $72,388 for 1939 and $73,644 for 1940 to eliminate duplication of cost in production and transmission expenses.

The Company has eliminated the property and expenses relating to the transportation of coke-oven gas used as fuel at its Hastings Compressor Station and in its figures has substituted the cost of an equivalent amount of natural gas priced at 22¢ per m.c.f. The Commission agrees with the Company and finds that $295,158 for 1939 and $333,036 for 1940 should be eliminated from operating expenses, and that $107,758 for 1939 and $126,000 for 1940 should be included in operating expenses to reflect the

equivalent cost of natural gas for the quantity of coke-oven gas used as fuel in the Hastings Station.

Hope furnishes steam from its compressor stations without charge to Hope Construction & Refining Company for use in the extraction plants, with the exception of the steam furnished from Goff Compressor Station, and does not record this transaction on its books. The necessary adjustment for this free steam has been made by the Commission. The Company credits revenue instead of expenses with the value of steam furnished by its Goff Station, thereby overstating both gas service revenues and the cost of compressing natural gas. The Commission, therefore, finds that operating expenses should be reduced $4,404 for 1939 and $6,000 for 1940 to state the actual cost of operation.

Hope bills the Peoples Natural Gas Company at the rate of 38.5¢ per m.c.f. for the natural gas sold and includes the gross amount of the billings in revenues. The Peoples Company must compress that gas to transport it to market, so Hope refunds 3¢ per m.c.f. to Peoples under the provision of the sales contract and includes this amount in its operating expenses as a cost of compressing gas. This accounting practice followed by Hope overstates the actual revenues and overstates the actual operating expenses. The Commission finds that the cost of compressing gas has been stated incorrectly and that operating expenses should be reduced $115,923 for 1939 and $292,158 for 1940.

Certain donations were included by the Company in Administrative and General Expenses. The Commission finds that donations amounting to $5,183 for 1939 and $3,496

for 1940 are not allowable costs for purposes of rate-making and should be deducted from operating expenses.

The Company has included $10,926 for the settlement of a claim for damages and $16,318 to meet a deficiency in its insurance plan for employees in general expenses for the year 1939. These expenses are applicable to prior years' operations and therefore not allowable for 1939.

Hope recorded the salvage received from an experimental liquefying gas plant as revenues in the amount of $23,896. That amount should have been applied as a reduction of the cost of the experiment, which cost was charged to 1940 operating expenses. Therefore, the Commission finds that 1940 operating expenses should be reduced $23,896.

*State and Miscellaneous Federal Taxes*

The Company has included in taxes for the years 1939 and 1940 certain amounts which should not have been included, and has failed to include certain other amounts which should have been included. The following table shows the amounts:

| | 1939 | 1940 |
|---|---|---|
| **Taxes Not Applicable** | | |
| Taxes applicable to prior years | $23,349 | $17,099 |
| W. Va. taxes billed others | 10,768 | 41,334 |
| Taxes not applicable to gas operations | 2,741 | 3,218 |
| | 36,858 | 61,651 |
| **Taxes Applicable** | | |
| Underaccrual of taxes | 16,548 | 313 |
| Net Tax Adjustment | $20,310 | $61,338 |

The Company has over-accrued Federal Income taxes on its books and the Commission has made a deduction of

$33,479 for 1939 and $16,480 for 1940 to reflect the taxes actually paid which were $191,521 for 1939 and tentatively reported to be $912,313 for 1940.

*Specific Distribution Expenses*

The Commission finds that certain amounts included in depreciation, administrative and general expenses, and taxes are specific distribution costs, as follows:

| | 1939 | 1940 |
|---|---|---|
| Depreciation | $ 82,000 | $ 89,345 |
| Taxes | 126,981 | 141,640 |
| Administrative and General | 17,237 | 13,231 |
| Total | $226,218 | $244,216 |

*Operating Expenses Summary*

The total of the Commission's adjustments to operating expenses per books results in a reduction of $1,186,002 for the year 1939 and a reduction of $1,199,958 for the year 1940, and they are summarized as follows:

| | 1939 | 1940 |
|---|---|---|
| **Decreases in Operating Expenses:** | | |
| Excess Profits on Gasoline and Butane | $ 234,876 | $ 185,103 |
| Steam Furnished H. C. & R. Co. " " " —Goff Station | 117,640 | 119,592 |
| Refund to the Peoples Nat. Gas Co. for compressing gas | 4,404 | 6,000 |
| Gas used in repressuring oil wells | 115,923 | 292,158 |
| Management Fees and Expenses | 72,388 | 73,644 |
| Excess Cost of Coke-oven gas | 192,415 | 109,194 |
| Donations | 187,400 | 207,036 |
| Salvage from Liquefying Gas Experiment | 5,183 | 3,496 |
| Taxes | — | 23,896 |
| Income Tax | 20,310 | 61,338 |
| Reclassification and Rate Case Expenses | 33,479 | 16,480 |
| Expenses applicable to Reserve Gas Co. | 543,121 | 624,041 |
| Expenses applicable to prior years | 125 | — |
| | 27,244 | — |
| Total Decreases | 1,554,508 | 1,721,978 |

| | 1939 | 1940 |
|---|---|---|
| **Increases in Operating Expenses:** | | |
| Abandoned Leases | $ 45,164 | $ 12,422 |
| Adm. & General Expenses capitalized in error | 79,439 | 138,018 |
| Depletion and Depreciation | 93,903 | 221,580 |
| Reclassification and Rate Case Expenses | 150,000 | 150,000 |
| Total Increases | 368,506 | 522,020 |
| Total Adjustments | $1,186,002 | $1,199,958 |

The functional classification of operating expenses per books and after the application of the foregoing adjustments follows:

| | 1939 | | 1940 | |
|---|---|---|---|---|
| **Operating Expenses** | **Per Books** | **Allowed** | **Per Books** | **Allowed** |
| **erstate Operating Expenses:** | | | | |
| Natural Gas Production | $ 1,439,971 | $ 1,186,578 | $ 1,427,594 | $ 1,227,930 |
| Gas Purchased | 7,746,854 | 7,675,105 | 8,605,981 | 8,533,779 |
| Transmission Expenses | 1,906,993 | 1,481,833 | 2,437,381 | 1,818,335 |
| Administrative and General Expense | 1,593,814 | 1,069,090 | 1,653,623 | 1,187,336 |
| Depletion | 18,400 | 392,500 | 18,384 | 624,440 |
| Depreciation | 1,200,000 | 837,803 | 1,309,418 | 835,597 |
| Amortization (other) | 6,369 | 6,369 | 5,996 | 5,996 |
| Exploration and Development Costs | 455,179 | 500,343 | 395,498 | 407,920 |
| Taxes: State and Miscl. Federal | 1,211,732 | 1,053,117 | 1,348,005 | 1,133,862 |
| Federal Income Tax (before tax saving) | 225,000 | 191,521 | 928,793 | 912,313 |
| Total Interstate | 15,804,312 | 14,394,259 | 18,130,673 | 16,687,508 |
| **ecific Distribution Expenses:** | | | | |
| Distribution | 201,929 | 201,775 | 215,128 | 215,128 |
| Customers' Acctg., Coll. and Sales Exp. | 166,180 | 164,167 | 161,917 | 160,908 |
| Administrative and General | | 17,237 | | 13,231 |
| Depreciation | | 82,000 | | 89,345 |
| Taxes | | 126,981 | | 141,640 |
| Total Distribution | 368,109 | 592,160 | 377,045 | 620,252 |
| Total Operating Expenses | $16,172,421 | $14,986,419 | $18,507,718 | $17,307,760 |

*Future Operating Expenses*

The operating expenses as determined for the purpose of estimating the future cost of interstate service are based primarily on the actual operating cost for the year 1940, the latest available data in the record. That year reflects an increase of $2,300,000 over the operating expenses of 1939 and is the best guide to present and future costs.

The Commission finds that the following adjustments to 1940 costs are reasonable and proper for the purpose of estimating future operating expenses for rate fixing:

| | | |
|---|---|---|
| Increase in wages not reflected in 1940 operating costs | | $202,172 |
| Increase in West Virginia property taxes not reflected in 1940 operating costs | | 81,751 |
| Decrease due to the following non-recurring costs which were included in administrative and general expenses for 1940: | | |
| Cost of moving Company office from Pittsburgh, Pa. to Clarksburg, W. Va. | $41,750 | |
| Experimental liquefying gas plant | 8,492 | |
| Pennsylvania State income tax | 4,601 | |
| Decrease | | 54,843 |
| Increase in Exploration and Development costs to allow an average amount of $600,000 annually in the future costs | | 192,080 |
| Total net increase over 1940 operating expenses | | $421,160 |

*Federal Income Tax*

In accord with practice, Hope's income tax return for 1940 was prepared on a tentative basis. The evidence in the record shows that the net taxable income was approximately $3,801,304 for 1940 and was $1,160,733 for 1939, that the tax rate was 24% for 1940 and 16.5% for 1939, and that the income tax was approximately $912,313 for 1940 and was $191,524 for 1939.

The Company does not report operating revenue deductions for tax purposes the same as it records them on its books.[30] Adjustments for rate-making and accounting purposes do not affect operating expenses for tax purposes, because that amount is determined by the administration of the federal Revenue Acts. The complete effect of all Commission adjustments is shown by any increase or decrease in revenues which results from a rate order. In order to determine a reasonable allowance for income taxes it is necessary only to apply the proper tax rate to the net taxable income applicable to the test year and to give effect to any tax saving or increase by reason of a change in revenue due to a rate order.

A combined normal and surtax rate of 40% is being discussed in Congress. We will use that rate for the purpose of computing the future income tax allowance. Based on 1940 net taxable income of $3,801,304 the income tax would be $1,520,522 at a 40% tax rate.

Each dollar of the indicated reduction in gross revenues will result in a reduction of forty cents in income taxes. The following computation shows the indicated reduction in rates and the amount of income taxes by applying the rate of return found to be fair and which is discussed in the subsequent section:

---

[30] The net income per books in 1940 was $5,234,175 after book income taxes of $928,793 or $6,162,968 before income taxes. The net taxable income for that year was $3,801,304 showing that Hope claimed $2,361,664 for tax deductions not reflected in operating expenses on its books.

—54—

| | Before Income Tax Saving | After Income Tax Saving |
|---|---|---|
| Operating Revenues from Interstate Sales | $19,296,755 | $15,686,898 |
| Deductions: | | |
| Interstate Operating Expenses (Excluding income taxes) | 16,196,355 | 16,196,355 |
| Other Gas Revenues | ( 83,275) | ( 83,275) |
| Allocation of costs to local West Va. Sales[31] | ( 2,694,075) | ( 2,694,075) |
| Federal Income Tax at 40% | 1,520,522 | 76,579 |
| Net Operating Revenue from Interstate Sales | $ 4,357,228 | $ 2,191,314 |
| Return at 6½% on Interstate Rate Base of $33,712,526 | 2,191,314 | |
| Excess Earnings before Income Tax Saving | 2,165,914 | |
| Income Tax Saving | 1,443,943 | |
| Excess Earnings after Income Tax Saving | $ 3,609,857 | |

The Commission finds that the amount of $76,579 is an adequate allowance for Federal Income taxes for the future.[32]

---

[31] Computed as follows:

| | | |
|---|---|---|
| West Virginia Operating Revenues | | $3,435,675 |
| Specific Distribution Expenses | $ 620,252 | |
| Return at 6½% on Distribution Property | 121,348 | 741,600 |
| Allocation of costs to W. Va. Sales | | $2,694,075 |

[32] Computed as follows:

| | |
|---|---|
| Net Taxable income for 1940 | $3,801,304 |
| Reduction in revenues | 3,609,857 |
| Revised Net taxable income | 191,447 |
| Tax Rate | 40% |
| Allowance for Income Tax | $ 76,579 |

The operating expenses allowed for the future are shown by the functional classification in the following tabulation:

—55—

| | 1940 | Adjustments For Future Operating Changes | As Adjusted For Future |
|---|---|---|---|
| **Interstate Operating Expenses:** | | | |
| Natural Gas Production | $ 1,227,930 | $ 202,172 | $ 1,430,102 |

—56—

## RATE OF RETURN

Many factors enter into the determination of what constitutes a fair rate of return in each rate case. The Supreme Court has stated the principal factors in *Bluefield Water Works & Improvement Co. v. Pub. Serv. Comm.*, 262 U. S. 679, 692-3. They are that the return of a public utility shall be equal to that generally being made at the same time and in the same region on investments in other enterprises attended by corresponding risks and, that the return should be sufficient to assure confidence in the finan-

cial soundness of the utility and to maintain its credit and enable it to attract the capital necessary for the proper discharge of its public duties.

The record contains an abundance of evidence on the subject of rate of return. The information includes investors' appraisal of the natural gas industry, comparative risk rata, interest rates and yields on securities of natural gas and electric utilities, statistics showing the growth and stability of the natural gas indusfry, the trend of the cost of money and its current cost, commodity price indices, industrial production, employment, and payroll indices, federal reserve bank rediscount rates, national income payments and other economic data, idle money statistics, the financial history of the Hope Company and the facts about recent financing by its parent Standard Oil Company. That evidence reveals unmistakably that, compared to industrial and railroad enterprises, the utility business has relatively greater stability. Moreover, it shows also that interest rates generally are now lower than

—54—

they have ever been in this century; it discloses that the yields on better issues of natural gas company bonds sold in the last year or two are close to 3%.

The Company's contention that it should be allowed a rate of return not less than 8% is unreasonable. The record shows that the Hope Company is a seasoned enterprise whose risks have been minimized by (1) ample past and present provisions for depletion and depreciation with concurrent high profits; (2) protected established markets, through affiliated distribution companies, in populous and industrialized areas; and (3) available supplies of gas locally to meet requirements, except on certain peak days in the winter, which it is feasible to supplement in the future with gas from other sources. During the forty-two years of its history, to 1941, Hope has earned on its owners' equity an annual average profit of 12% and, in addition,

has built up through annual provisions charged to expense, depletion and depreciation reserves far in excess of requirements. Hope faces no hardship with respect to increased taxes, operating expenses, and inflation, greater than those faced by similar enterprises. The Company's efficient management, established markets, financial record, affiliations, and its prospective business place it in a strong position to attract capital upon favorable terms when it is required.

In making the findings on rate of return, the national and international situations have commanded our attention and entered our deliberations. The Commission is aware of the increased demands made upon Hope for gas due to

the war program. Considering these matters, the underlying factors, and all of the evidence in the record, the Commission finds that 6½% is the fair rate of return for the Hope Natural Gas Company. This rate of return being for the future, has been set only after endeavoring to weigh all known and predictable elements; in setting it we have made allowance for presently unforeseeable contingencies. Our views on the subject of rate of return are consonant with recent decisions by the Supreme Court and other courts and commissions involving natural gas companies.[33]

## LAWFULNESS OF PAST RATES

In 1938 the Cities of Cleveland and Akron, Ohio, filed complaints with the Federal Power Commission alleging that the rate which Hope charged East Ohio Gas Company

---

[33] *Federal Power Commission v. Natural Gas Pipeline Co.*, 315 U. S. ...; *Peoples Gas Light & Coke Co. v. Slattery*, 373 Ill. 31, 25 N. E. (2d) 482, 500-501, 31 P. U. R. (N. S.) 193, 217-218, App. Div. 309 U. S. 634; *East Ohio Gas Co. v. Cleveland*, 27 P. U. R. (N. S.) 387, 412, Aff. 137 O. S. 225, 28 N. E. (2d) 599, 612, 35 P. U. R. (N. S.) 158, 174-175; *Re Montana-Dakota Utilities Co.*, 32 P. U. R. (N. S.) 121, 128; See *Re Canadian River Gas Co. et al.*, F. P. C. Op. 73.

was unjust, unreasonable and unlawful. These complaints were registered before Hope filed its five interstate wholesale rate schedules which are involved in these proceedings. The acceptance of a rate schedule for filing does not mean that the Commission approves it, and does not establish the justness or reasonableness of the rate. *Re Home Gas Co.*, 39 P. U. R. (N. S.) 102, 109. On October 14, 1938, this Commission instituted an investigation of the reasonableness of all of Hope's interstate rates. If it had been possible to adduce the volume of evidence required for the disposition of such a complex matter within a few months,

—59—

the Commission would have prescribed the reasonable interstate wholesale rates for 1939 and subsequent years. The City of Cleveland raised the issue of the lawfulness of the rate charged by Hope to the East Ohio Gas Company and asked this Commission, as an aid to State regulation, to make a separate determination of the reasonable rates since June 30, 1939. Originally the City of Cleveland requested this Commission to find the lawful Hope-East Ohio rates since June 21, 1938, but it now represents that the subject is idle for rates prior to June 30, 1939, because those rates which Cleveland consumers were obligated to pay East Ohio have been settled. The Commission does not have the authority to fix rates for the past and to award reparations. But Congress did empower and instruct the Commission in Section 5(a) of the Natural Gas Act to fix future rates, and as a step in that process we must necessarily consider the reasonableness of past and existing rates. When the issue is raised and the public interest will be served, we consider as a necessary part of that duty the power to examine the entire rate problem involved and to determine what rates were lawful in the past. Also, Section 14(a) of the Act authorizes the Commission to investigate any facts which it finds necessary in order to determine whether Hope has violated any provision of the Natural Gas Act. Furthermore, the Commis-

sion has power to perform any act, pursuant to Section 16, which is necessary or appropriate to carry out the provisions of the Act. Under Section 4(a) of the Act any interstate wholesale rate that is not just and reasonable is unlawful. *Federal Power Commission v. Natural Gas Pipe-*

—60—

*line Co.*, 315 U. S. .... Hope's rate collected from East Ohio Gas Company was lawful after June 21, 1938, the effective date of the Act, only to the extent that it was just and reasonable. The City of Cleveland states that the Ohio Commission is investigating the reasonableness of the East Ohio Gas Company's bonded retail rates in Cleveland for the period since June 30, 1939, and that the lawfulness of Hope's rate is an important factor in the case. Since the enactment of the 1938 Natural Gas Act this Commission has had exclusive jurisdiction to determine the lawfulness of the interstate wholesale rates charged by Hope and other natural gas companies.[34]

In response to the request of the City of Cleveland, the Commission will make the appropriate findings of fact as to the lawfulness of the rates charged East Ohio by Hope since June 30, 1939. The Interstate Commerce Commission has furnished precedents for the performance of this public duty.[35] Congress intended that this Commission cooperate with State Commissions and municipalities, and the provisions of Sections 5(b) and 17 are special evidence of such intent.

## REASONABLE EARNINGS AND RATES FOR THE FUTURE

Future reasonable earnings and rates must be fixed with consideration of a forecast of operating revenues and

—61—

expenses. The most recent experience of the Company is the best guide for prognostications. The President of the Company predicted a great increase in sales for 1941 over 1940. Comparative income figures for the first quarters of 1940 and 1941 show an increase of $592,000 in net operating income or about 20%. The increasing demands for natural gas in the industrialized areas of Hope's markets are common knowledge. It seems certain that 1940 will be the lowest year, on an earnings basis, of the 1940-1944 period. Upon a consideration of all the relevant facts in the record and the future prospects, the Commission finds that 1940 is a conservative "average" year and should be used in rate-making in these proceedings. This is a conservative basis because allowance will be made for all probable future increases in the rate base and operating expenses while the operating revenues for the relatively low year of 1940 are employed as the test in fixing rates for the future.

Applying the 6½% rate of return to the rate base for the future of $33,712,526, produces $2,191,314 as the amount of annual return which the Company is entitled to earn in the future. Hope's income available for return is not less than $5,801,171, so the excess of $3,609,857 is the sum by which existing revenues must be reduced.

Hope's gas sales revenues are classified between intrastate sales and interstate sales for purposes of determining the sales and rates subject to the jurisdiction of this Commission.

—62—

Hope's entire properties are located within the State of West Virginia and production, transmission, compressing and general facilities are used jointly for intrastate or

local sales and interstate or export sales. Therefore, a classification or allocation is necessary to determine operating expenses and return applicable to the interstate business. Certain direct costs pertaining to distribution property and sales in West Virginia are easily segregated from the joint costs. The allocation of the remaining joint costs is made in accordance with the following facts and principles which are undisputed in the record and accepted by all parties to these proceedings.

The Company's local retail business in West Virginia is incidental to its major business of exporting gas from West Virginia. In determining the allocation of joint expenses to the local West Virginia business, this fact was given consideration, with the result that a smaller amount of expenses was allocated to that business than would have resulted by the application of one of the customary allocation methods. Briefly, the amount of joint expenses (including return) allocated to the local business was that amount which, together with the specific local expenses, would give the Company a 6½% return on the net investment in property used exclusively in the local business. As indicated above, a more orthodox allocation probably would have resulted in assigning a larger share of the joint costs to the West Virginia sales and a greater amount of the excess profit, although the amount would not be material, to the interstate sales. The method used was

proposed by representatives of the Company and was not controverted.

The following schedule (Col. (c)) shows the excess of future net operating revenue over 6½% return on the interstate rate base, and Columns (d) and (e) show the prescribed rates and revenues after giving effect to the rate reduction:

**Net Operating Income Available For Return**

Rate Base for Interstate Sales $33,712,526

| | M.c.f. | Before Reduction | After Reduction | |
|---|---|---|---|---|
| | | | Prescribed Rates M.c.f.—cents | Amount |
| (a) | (b) | (c) | (d) | (e) |
| **Operating Revenues from Interstate Sales:** | | | | |
| East Ohio Gas Company | 40,376,091 | $14,726,736 | 29.50 | $11,910,947 |
| Peoples Natural Gas Company | 9,738,612 | 3,457,207 | 28.50 | 2,775,504 |

| Fayette County Gas Company | 859,106 | 270,618 | 28.50 | 244,845 |
| Manufacturers Light and Heat Company | 2,241,684 | 706,131 | 28.50 | 638,880 |
| Total Interstate Revenues | 53,604,243 | $19,296,755 | | $15,706,239 |
| **Deductions:** | | | | |
| Operating Expenses | | 16,272,934 | | 16,272,934 |
| Other Gas Revenues | | (83,275) | | (83,275) |
| Allocation of Costs to Local West Virginia Sales | | (2,694,075) | | (2,694,075) |
| Total Deductions from Interstate Revenues | | 13,495,584 | | 13,495,584 |
| Net Operating Income from Interstate Sales | | 5,861,171 | | 2,210,655 |
| 6½% Return on Interstate Rate Base | | 2,191,314 | | 2,191,314 |
| Excess of Future Net Operating Income over 6½% Return on Interstate Rate Base | | $ 3,609,857 | | $ 19,341 |

—64—

The Company's intrastate rates are under the jurisdiction of the Public Service Commission of West Virginia. The West Virginia Commission and the State of West Virginia are intervenors in these proceedings and no objection was made by them to the method used herein for the allocation of cost to local operations in West Virginia.

The evidence on the cost of service allocated among the five customer companies and the conditions of service for the respective companies disclose that no reduction in rates

[36] It is not considered necessary to refine average rates per m.c.f. more than the prescribed rates shown above and the result is the margin of $19,341.

is applicable to the affiliated River Gas Company. Among other reasons for this determination, is the fact that the River Gas Company is a small company and has a poor load factor. Accordingly, the total amount of the reduction in interstate rates is applicable to the East Ohio Gas Company, Peoples Natural Gas Company, Fayette County Gas Company and the Manufacturers Light and Heat Company. The present average rates per m.c.f. are 36.5¢ for East Ohio Gas Company, 35.5¢ for the Peoples Natural Gas Company, 35¢ for the River Gas Company, and 31.5¢ for Fayette County Gas Company and the Manufacturers Light and Heat Company.

The conditions and characteristics of service, required by the contracts, are similar for the East Ohio Gas Company and the Peoples Natural Gas Company with respect to obligations and priorities by classes of consumers, but there is a great difference with regard to delivery pressures. Hope Company delivers gas to the East Ohio Company at sufficiently high pressures so that no additional compression is required by the East Ohio Company for de-

livery of the gas to the ultimate consumers. On the other hand, Hope delivers gas to the Peoples Natural Gas Company, at various pressures, into that company's Brave Compressor Station and the Peoples Company must compress the gas for transportation to the ultimate consumers. From the evidence we conclude that the differential of one cent between the average price per m.c.f. for gas sold to the East Ohio and the Peoples Companies is reasonable, and it reflects the difference in the cost, conditions and characteristics of service.

Considering the cost of rendering service to the Fayette County Gas Company and the Manufacturers Light and Heat Company, and the conditions and characteristics of service to those companies, the fact that Hope knows precisely what deliveries it must make to them from day

to day and the fact that those two companies buy less than 6% of the total gas sold by Hope, the Commission finds that the rate for these companies should not be different from the rate paid by the Peoples Natural Gas Company. In the absence of compelling reasons to the contrary; it is good and desirable practice to fix rates that are uniform. Applying this principle in these proceedings the Commission will prescribe uniform rates for the Peoples Natural Gas Company, Fayette County Gas Company and the Manufacturers Light and Heat Company.

After considering all the evidence with respect to Hope's interstate wholesale rates and the proper average rates per m.c.f. for the five customer companies at the respective points of delivery, the Commission finds the fol-

—66—

lowing rates to be just and reasonable:

| | Average Rate Per. M.c.f.—Cents |
|---|---|
| East Ohio Gas Company | 29.5 |
| Peoples Natural Gas Company | 28.5 |
| Fayette County Gas Company | 28.5 |
| Manufacturers Light and Heat Company | 28.5 |
| River Gas Company | 35.0 |

In passing, it might be noted that the over-all rate of return for 1940 would have been 8% if the new rates had been in effect that year and if the earnings from the distribution property had remained unchanged. This rate of return is reduced to 6½%, because of estimated increase in expenses and increase in rate base which we have allowed for the future.

Appropriate findings and order will be entered in accordance with this Opinion.

Hope Natural Gas Company
Docket No. G-113

MANLY, Commissioner, concurring:

I have joined in the majority opinion of the Commission in this case, with respect to the deduction of the "depreciation reserve requirement" in preference to the depreciation reserves carried on the books of the company, because such action seems to be required by the precedent established by the unanimous decision of the Commission in the Interstate Power case.[1]

In that case the depreciation reserves carried on the books of the Interstate Power Company were obviously deficient, as a result of "unsatisfactory" and "haphazard" accounting practices. They amounted to only about 2½ per cent of the electric plant account. If these utterly de-

[1] *Re Interstate Power Co.*, 32 P. U. R. (N. S.) 1, 10.

ficient book reserves had been accepted as the proper deduction for depreciation in arriving at the rate base, it would have given the company an advantage to which it was not entitled and would have resulted in imposing an unfair burden on the consuming public.

—2—

The Commission therefore, in that case as in the present case, determined on the record what the proper "depreciation reserve requirement" should be and deducted that amount in arriving at the rate base. In the Interstate case such requirement was found to be approximately 28 per cent of the electric plant account, or more than ten times the proportion carried on the company's books. In the instant case the reserves carried on the books are in excess of what the Commission has determined to be a proper reserve requirement, but the principle is exactly the same. We cannot, without discrimination, apply one principle in cases where the reserves are deficient and another where they are excessive. To do so would undermine the very foundation of utility regulation.

It may be noted also that, while many of the natural gas companies have built up excessive depreciation reserves, largely because they had no sound basis for determining the probable service life of their properties, this is not true in the electric utility industry. There it is probable, although no exact determination has been made, that a majority of the companies have established inadequate depreciation reserves. To apply the principle of deducting book reserves to the electric utility industry would therefore be grossly unfair to a large part of the consuming public.

Attention should also be directed to the fact that, until the passage of the Federal Power Act in 1935 and the Natural Gas Act in 1938, the depreciation policies of both

—3—

the electric utilities and the natural gas companies, as regards their interstate operations, were not subject to regulation. Under such conditions, while it is true that the amounts set up on the books as depreciation reserves were derived from revenues collected from customers, they did not, as under regulation, play a determining part in fixing the level of rates and the consequent amount of the revenues. Without regulation, the good old rule of "What the traffic will bear" is controlling and depreciation policies are an afterthought, determined by the management and board of directors. It follows therefore that, during the pre-regulatory period, the customers would not have contributed any more or less to the company's revenues, regardless of what depreciation program was pursued.

Finally, it may be noted that if the Hope company in the instant case had been improvident and dissipated its earnings to such an extent that its depreciation reserves should now be grossly deficient, the utmost that the Commission could do would be to direct the deduction of a proper "depreciation reserve requirement." It is difficult, therefore, to understand how it can be argued that, because it has prudently set aside for depreciation an amount greater than such requirement, it should now be penalized in fixing its rate base. Such a policy, it seems would place a premium on improvident and wasteful management because, until the Commission has made its official determination of the reserve requirement, no one can say with assur-

—4—

ance what it should be.

If the Commission, in the years that lie ahead, consistently requires proper reserve requirements to be set up on the books of interstate electric utilities and natural gas companies, and proper annual depreciation to be set aside, the time will soon come when all such companies will be on a uniform basis and the book reserves may properly be de-

ducted in arriving at the correct rate base. If such consistent policies are not followed, regulation will inevitably collapse under the unequal strains which have been imposed.

(Signed) BASIL MANLY,
*Commissioner.*

SCOTT, Commissioner, dissenting; in part:

This proceeding poses such a basic problem of regulation that I am constrained to dissent in part.

The majority has found a rate base in the amount of approximately $33,712,526, and has predicated the rates which it has prescribed upon the bases of allowing the Hope Company a return of 6½% upon that base.

Upon the record in this proceeding, I believe that the rate base for Hope Natural Gas Company can be reasonably determined not to exceed the sum of $17,662,792.[1] Using this figure as a predicate, a further reduction of some $1,040,000 in net revenue to Hope is clearly indicated.

---

[1] It might even be set at a lower amount; see discussion on page two hereof.

It seems to me that this case is an appropriate one in which to establish the concept that true prudent investment in property of the utility dedicated to the public service, is a fair and proper rate base. In this regard, the recent decision of the Supreme Court in the *Natural Gas*

—2—

*Pipeline Company of America* case[2] affords ample authority for the use of prudent investment. The problem, then, is to determine what is the amount prudently invested by the Hope Company in the properties now devoted to public service. This problem does not appear too difficult.

The total cost of plant used and useful in the public service has been found by the Commission to be approximately $52,000,000.

The depreciation and depletion reserves, as of December 31, 1940, as shown on Hope's books, attributable to this property was approximately $38,377,750.[3] In addition, it should be noted that Hope has in the past transferred $7,552,919 from depreciation and depletion reserves to

—3—

earned surplus.[4] It is unquestioned that every single dol-

---

[2] *Federal Power Commission, et al. vs. Natural Gas Pipeline Company of America, et al.*, 315 U. S. . . . ; 62 S. Ct. 736.

[3] The depreciation and depletion reserve per books at December 31, 1940, totals $46,654,691. $4,819,640 of this amount is attributable to the property of the Reserve Gas Company merged into Hope in 1939, but, as is pointed out by the majority in a footnote, the property and income of Reserve have been segregated and excluded for purposes of these proceedings. $1,866,887 of the reserve is applicable to distribution property with which we, of course, are not here concerned. $1,590,414 represents charges to the reserve by reason of adjustments made in plant accounts at December 31, 1938, but not recorded on the books. The book reserve, therefore, applicable to Hope's property with which we are concerned is thus $38,377,750. The deduction of this reserve from $51,957,416, cost as found by the majority, leaves $13,579,666, to which is added (per the majority opinion) $4,083,126 for net capital additions 1941, 1942 and 1943, useful unoperated acreage and working capital, making a total of $17,662,792.

[4] If correction be made for this transfer, the rate base would not exceed $10,109,873.

lar in the depreciation and depletion reserves (as well as the $7,552,919 transferred from those reserves to surplus) has been taken from gross operating revenues whose only source was the amounts charged customers in the past for natural gas. It is, therefore, a fact that *the depreciation and depletion reserves have been contributed by the customers* and do not represent any investment by Hope. Indeed, J. C. Chisler, Vice President and Treasurer of Hope, testified that it had been the company policy to retain revenues obtained through the medium of depreciation to finance and to develop its property.

The funds accumulated by such charges to operating expenses, the net total of which is represented by the amount in these reserves, have been used to build property now in service.

As was pointed out in the *Lindheimer case*:[5]

> "* * * According to the practice of the Company, the depreciation reserve is not held as a separate fund but is invested in plant and equipment. As the allowances for depreciation, credited to the depreciation reserve account, are charged to operating expenses, the depreciation reserve invested in the property thus represents, at a given time, the amount of the investment which has been made out of the proceeds of telephone rates for the ostensible purpose of replacing capital consumed. * * *"

—4—

It is proper, of course, that depreciation and depletion reserves should be accumulated from consumer payments for service to assure that the capital embarked in the enterprise by the utility owner shall remain unimpaired. But it is an equitable corollary of the duty which rests upon the consumer that he shall not be required to pay a return on amounts which, in fact, *he, rather than the owner of the utility, has contributed.*

---

[5] *Lindheimer v. Illinois Bell Telephone Company*, 292 U. S. 151, 168.

The majority has very properly pointed out that property which has been constructed by past charges to operating expense, such as well drilling and overhead charges, should not be permitted to be capitalized for ratemaking—or for any other—purposes. This is based on the simple equitable principle that the customer should not be required to pay more than once. With this position of the majority, I am, of course, entirely in accord. Moreover, I can see no distinction between property which has been constructed by the company through charges upon the consumers by operating expenses labelled, for example, "well drilling expense" and property which has been constructed by the company through charges upon the consumers by operating expenses labelled "depreciation and depletion expense." In the latter case, equally with the former, the only amount *invested by the utility owner* in the business is the amount over and above the amount of property whose construction was paid for by operating expense charges. Consequently,

—5—

if we are setting as the rate base the prudent investment by the owner in the property, we should not permit the owner a return on something which quite patently he has not invested in the property.[6]

This principle is eminently fair in practice and is certainly not new in utility regulation. For example, in the case of *Re Mondovi Telephone Company*, P. U. R. 1933B, 319, the Wisconsin Commission concluded that:

> "* * * Customers who have unwittingly been financing property additions in the manner shown [by charges to operating expenses made by the company for capital additions] should not be expected to pay

[6] The same principle, of course, would apply to a so-called fair value rate base. In that case the only amount to be "valued" would also be the amount invested by the owner and not that amount contributed by the consumer.

rates which will allow a return on the property so paid for.'"[7]

—6—

Whether customer contributions be made directly for the purpose of building specific additions to plant or whether they be made somewhat indirectly but are likewise used for the construction of plant, there is no reason in either case why the customers, having contributed the funds to build the plant, should be required to pay to the utility company a return on the amount they have contributed.

In the *Mondovi case* the precise problem of deduction of the full depreciation reserve was also directly involved. The depreciation reserve was admittedly in excess of the existing depreciation in the property, i.e., the used-up service capacity of the property. But the Wisconsin Commission said:

"• • • The question now arises whether the entire [depreciation] reserve should be deducted from the property and plant account to arrive at a proper rate

[7] The exact facts as set out by the Commission were as follows:

"• • • year after year certain items of capital expenditure, notably wages of labor used in making additions to plant, were charged to operating expenses. The revenues received from subscribers, through the rates charged for service, more than covered these operating expenses, including items of expenditures for plant additions erroneously included in maintenance expense. In other words, the rates paid by subscribers were sufficient not only to pay running expenses but also to pay labor used in adding to the property. In addition, these rates provided a return enabling the company to pay dividends in every year except one during the past eighteen years, these dividends averaging just under 8 per cent on the stock outstanding during the 18-year period. The effect of including in the appraisals property so paid for and then using these appraisals in determining a rate base is to require customers to pay twice. Year after year, through these erroneous charges to operating expense, subscribers have been paying for plant additions, and now, if the appraisal values are used as a rate base, subscribers will be forced to pay a return on property already paid for by them.

"Such a result, in our opinion, would be grossly unfair. • • •"

base. Because of the fact that any excess in the reserve over and above an amount representing the used-up service capacity of the property is made up of 'involuntary' contributions on the part of the subscribers, we do not believe that the company is entitled to earn a return on property financed by such contributions. * * *"

The majority itself has pointed out that with respect to cost of property the Supreme Court of Appeals of West

—7—

Virginia has taken a position on consumer contributions to capital in the form of overheads which is identical with this one.[8]

Certainly the fact that not only the overheads but the direct cost, as well, of the property financed by the depreciation and depletion reserves have been contributed by the customers should emphasize the lack of equity in requiring the public to keep on paying a return on that which it has contributed to the property. There is neither fairness nor economic necessity in such a requirement.

Nor are we without specific authority of the United States Supreme Court on this exact point. In the case of *Louisiana R. R. Comm. v. Cumberland Tel. Co.*, 212 U. S. 414, the Court pointed out (p. 424):

"* * * It was obligatory upon the complainant to show that no part of the money raised to pay for depreciation was added to capital, upon which a return was to be made to stockholders in the way of dividends for the future. It cannot be left to conjecture, but the burden rests with the complainant to show it. It certainly was not proper for the complainant to take the money, or any portion of it, which it received as a result of the rates under which it was operating, and

[8] *City of Wheeling v. Natural Gas Co. of W. Va.*, 115 W. Va. 149, 175 S. E. 399, 5 P. U. R. (N. S.) 471; *Natural Gas Company of West Virginia v. Public Service Commission*, 95 W. Va. 557, 121 S. E. 716, P. U. R. 1924D, 346. See also *Re Reedsburg Telephone Company*, 7 P. U. R. (N. S.) 389, 395.

so to use it, or any part of it, as to permit the company to add it to its capital account, upon which it was pay-

—8—

ing dividends to shareholders. If that were allowable, it would be collecting money to pay for depreciation of the property, and, having collected it, to use it in another way, upon which the complainant would obtain a return and distribute it to its stockholders. That it was right to raise more money to pay for depreciation than was actually disbursed for the particular year there can be no doubt, for a reserve is necessary in any business of this kind, and so it might accumulate, but to raise more than money enough for the purpose and place the balance to the credit of capital upon which to pay dividends cannot be proper treatment. * * *"

What the Court there condemned is what Hope claims here.

The majority has found that $22,328,016 is money enough for the purpose of a reserve for depreciation. It also appears from the record that Hope has accumulated $16,049,734 more than enough for this purpose, or $23,602,653 more than enough if adjustment be made for the transfers from depreciation and depletion reserves to surplus. This balance of approximately $23,600,000 the majority permits Hope to place to the credit of capital upon which dividends may be paid—a result which the Supreme Court in the *Cumberland Telephone Company Case, supra*, unequivocally states "cannot be proper treatment." Certainly it cannot be gainsaid that Hope has taken this portion of the depreciation and depletion money which it received as a result of the rates under which it was operating and has so used it "as to permit the company to add to its capital account upon which it was paying dividends to shareholders." Hope has done this for practically its

—9—

entire history. It seems to me that simple justice to the consumers demands that we follow the injunction of the

Supreme Court and call a halt to this unjustified exploitation of the public.[9]

The Supreme Court, in the *Lindheimer case, supra*, appears clearly to support my conclusions when it said at page 169:

> "* * * But if the amounts charged to operating expenses and credited to the account for depreciation reserve are excessive, to that extent subscribers for the telephone service are required to provide, in effect, capital contributions, not to make good losses incurred by the utility in the service rendered and thus to keep its investment unimpaired, but to secure additional plant and equipment upon which the utility expects a return."

I can find no justification whatever for permitting Hope to continue to make profits upon capital which it has required the public to contribute to its business. We, certainly, are under no constitutional compulsion or requirement to permit Hope longer to take such profits. For, as Chief Justice Stone stated in the *Natural Gas Pipeline Co. of America* case:

> "* * * The Constitution does not require that the owner who embarks in a wasting asset business of limited life shall receive at the end more than he has put into it. * * *"

Obviously, the fictional character of the company's claim of *property* permeates any suggestion of confiscation. There can be no confiscation of *property* when the prop-

---

[9] The case of *Board of Public Utility Commissioners v. New York Telephone Co.*, 271 U. S. 23, is in no way contrary to this position. As was pointed out by the West Virginia Supreme Court of Appeals in *Wheeling v. Natural Gas Co., supra*: "An examination of that case shows that the board of commissioners had directed the company to make up current losses out of reserves accumulated in the past. No question was raised there in regard to including property in the rate base which had theretofore been paid for out of operating expenses."

erty claimed taken is made up of "involuntary" contributions on the part of consumers.

Over its entire history, the investors in Hope have earned extraordinarily generous returns upon their invested capital.[10] The entire investment in Hope, as pointed out in the majority opinion, is represented by capital stock. From its very inception through 1940 the investors have received in cash dividends an annual average of 20% on the average amount of capital stock issued for cash or other assets.

Part of the stock of Hope now outstanding represents common stock dividends issued from time to time, and it appears that Hope has paid over its entire history average annual cash dividends of approximately 13 to 14% on all its common stock, including not only stock issued for cash or assets but also stock issued as dividends. Its depreciation and depletion reserve has been built up *after* such earnings were paid out. Obviously, a utility company

—11—

which has existed for 43 years—through several major economic erises in the country—with such an extraordinary rate of earnings can hardly claim in any good conscience to be entitled to continue to make additional returns upon sums patently *contributed by its customers.*

The prudent investment doctrine as classically expounded by Mr. Justice Brandeis in the *Southwestern Bell case*[11] was designed to afford the utility investor assurance that he would always receive a fair return upon his investment and to save the consumer from being required to pay a return upon any increment above that investment. It was never intended to serve as a method by which the utility investor was to be permitted to earn a return upon funds or property contributed by someone other than himself.

---

[10] During period 1908-1940, $97,273,640 in cash dividends have been paid by the Hope Company.

[11] 262 U. S. 276, 289.

Mr. Justice Brandeis pointed out almost at the very outset of his opinion that:

> "* * * The thing devoted *by the investor* to the public use is not specific property, tangible and intangible, but capital embarked in the enterprise. * * *
>
> "The investor agrees, by embarking capital in a utility, that its charges to the public shall be reasonable. * * *"

The basic theme of the entire opinion is that the amount upon which the investor is entitled to earn is *his* investment in the utility and no more. This is so patently fair to all concerned that it should require no further comment.

—12—

This case may seem like a hard one in which to apply this very fundamental and sound principle because of the fact that its application would result in the reduction of the rate base to a comparatively low figure. But there is no injustice in limiting the company to a return on *its investment*, while there is, on the other hand, great inequity in requiring, as does the majority, the consumers to pay a return on some sixteen to over twenty-three and a half millions of dollars which they have contributed to the building of the Hope system.

For these reasons I believe that the rate base should here be the cost of property used and useful in furnishing service, less the actual depreciation and depletion reserves attributable to such property.

(Signed) JOHN W. SCOTT,
*Commissioner.*

Washington, D. C.,
May 26, 1942.

## 4. COMPLETE LIST OF EXHIBITS BY ABBREVIATED TITLES CLASSIFIED BY SUBJECT MATTER.

| Exhibit Number | Offered By Company | Exhibit Number | Offered By F. P. C. Staff |
|---|---|---|---|

### I. THE COMPANY'S PROPERTIES AND OPERATIONS.

#### (A) Maps.

| | | | |
|---|---|---|---|
| 1 | Tonkin: Map of Hope, East Ohio, Peoples and River systems | 41 | Hayne: Map of Hope's system |
| 1-A | Tonkin: Reduced scale copy of Ex. 1 | 41-A | Hayne: Statement explaining Ex. 41 |
| 3 | Tonkin: Interval maps showing development of Hope's properties | 72 | Hayne: Gas flow maps |
| 3-A | Tonkin: Reduced scale copies of Ex. 3 | 72-A | Hayne: Statement explaining Ex. 72 |

#### (B) Export Sales Contracts.

| | | | |
|---|---|---|---|
| 5 | With East Ohio | 47 | Shattuck: Specified conditions of service in Hope's filed rate schedules |
| 6 | With Peoples | | |
| 7 | With River | | |

# STATEMENT OF POSITION AND EXPERIENCE OF LORING L. TONKIN

**1. Name, address and age**

Loring L. Tonkin, 701 Milford Street, Clarksburg, West Virginia, age 52.

**2. Education**

High school, Oil City, Pennsylvania; graduated from Phillips Academy, Andover, Massachusetts, in 1908 and from Cornell University, Ithaca, New York, in 1912 with the degree of Mechanical Engineer.

**3. Present position**

President, General Manager and Director of Hope Natural Gas Company.

**4. Experience**

While attending school and college I worked every summer from 1903 to 1911 for Hope Natural Gas Company and affiliated gas companies on compressor station and pipe line construction. In June 1912 I went to work permanently for Hope Natural Gas Company serving first as Meter Engineer (1912) and successively as Assistant Engineer in the Company's compressor station department (1913-1915); Division Engineer in charge of construction and operation of compressor stations (1915-1918); Assistant Chief Engineer and Chief Gas Dispatcher (1919-1920); Chief Engineer, Assistant General Superintendent and Chief Gas Dispatcher (1920-1932); Vice President, Chief Engineer and Director (1932-1939); and President, General Manager and Director from February 1939 to date.

—2—

In the course of my services for the Company I have from time to time had charge of substantially all branches

of its operations, including the operation and construction of compressor stations, the dispatching of all of its gas, the operation of its trunk line system, the operation of its distribution plants, the operation of its wells and of its leasing, drilling and other field activities.

—3—

## WRITTEN STATEMENT OF LORING L. TONKIN

### A. Matters Covered By This Exhibit

1. The Hope Company's principal sales are as follows:

| *To* | *1938 Sales (M.c.f.)* |
|---|---|
| The East Ohio Gas Company | 30,316,773 |
| The Peoples Natural Gas Company | 2,870,545 |
| The River Gas Company | 222,615 |
| Fayette County Gas Company | 837,986 |
| The Manufacturers Light & Heat Company | 4,772,083 |
| West Virginia domestic, industrial, field and other consumers | 8,900,612 |
| Total | 47,920,614 |

2. Of these companies East Ohio, Peoples and River are wholly owned subsidiaries of Standard Oil Company (New Jersey) as is the Hope Company. Fayette and Manufacturers are not affiliated with the Company in any way.

3. There have been prepared by me or under my supervision from the books of the Company and its affiliated companies the following Company exhibits:

Co.X.1 —Map of Main Pipe Line Systems of Hope Natural Gas Co., The East Ohio Gas Co., The Peoples Natural Gas Co. and The River Gas Co.—1939.

Co.X.1A—Reduced Scale Copy of Company Exhibit No. 1.

Co.X.2 —Hope Natural Gas Company—statistics as to the Company's Properties, Markets and Sources of Gas Supply.

Co.X.3 —Hope Natural Gas Company—Interval Maps Showing the Development of the Company's Properties:

Map No. 1—1901
Map No. 2—1906
Map No. 3—1911

—4—

Map No. 4—1916
Map No. 5—1921
Map No. 6—1926
Map No. 7—1931
Map No. 8—1936
Map No. 9—1939

Co.X.3A—Reduced Scale Copies of Company Exhibit No. 3.

Co.X.4 —This exhibit explaining Company Exhibits Nos. 1, 2 and 3.

4. This written statement will describe generally the Company's properties, markets, sources of gas supply and its operations, and will trace briefly the development of its properties, referring frequently to these exhibits by the indicated abbreviations.

—5—

**B. General Descriptions Of The Properties Shown On The Main Pipe Line System Map, Co.X.1**

1. Co.X.1 (and its reduction, Co.X.1A) shows parts of the States of West Virginia, Pennsylvania and Ohio with the main pipe line systems of the Hope, East Ohio, Peoples and River Companies as of December 31, 1938 shown thereon.

2. In Ohio there is shown by dark blue lines the main transmission system of East Ohio starting at the Ohio River at Clarington and Round Bottom Measuring Stations and running north through the Canton, Massillon and Akron area to Cleveland, with easterly lines over to the

Youngstown district and southwesterly lines from the Danville and Wooster territory. East Ohio serves about 495,000 domestic consumers located in the Cleveland metropolitan area and in the other Ohio cities shown by green dots on the map, a total of 64 municipalities.

3. In Pennsylvania there is shown in light blue lines the main transmission system of Peoples. This system supplies the Pittsburgh district with part of its gas, has an easterly extension to Altoona and Tyrone, northerly extensions into Butler, Armstrong, Clarion, Jefferson and Elk Counties and a northwesterly extension which connects with the East Ohio system at the Pennsylvania-Ohio state line. This latter is used when necessary during winter peak load periods for the delivery of Hope gas to East Ohio at the Pennsylvania-Ohio state line. During 1938 the Peoples Company had about 124,000 domestic consumers located in a portion of Pittsburgh and in the other Pennsylvania cities indicated in green on the map, and now has about 149,000 domestic consumers by reason of the merger of The Columbia Natural Gas Company with Peoples at the end of 1938.

—6—

4. In the southeastern section of Ohio near the Ohio River are shown some scattered properties colored in maroon owned by The River Gas Company. This is a small company with about 9,000 consumers in Marietta and the other Ohio cities and villages shown in green on the map.

5. The pipe lines of the Manufacturers and Fayette Companies are not shown on C.X.1. Both are gas companies distributing natural gas in various municipalities, Manufacturers in Pennsylvania, West Virginia and Ohio and Fayette in Pennsylvania.

6. In addition to selling gas to these five companies, Hope distributes natural gas in various communities in West Virginia, serving about 42,000 domestic consumers. The Company's principal distribution plants in West Vir-

ginia are at Clarksburg, Parkersburg, Weston, Mannington, Salem and Sistersville. The small green areas marked on the map indicate the larger of these distribution plants.

7. The Hope Company's deliveries to East Ohio are made at the West Virginia-Ohio state line at two points, near Clarington and near Round Bottom Stations on the Ohio River, where Hope's lines connect with those of East Ohio. Its deliveries to Peoples are made at the West Virginia-Pennsylvania state line at a point immediately south of the Brave Compressor Station of the Peoples Company and also near the southwest corner of Pennsylvania as indicated on Co.X.1. Its deliveries to the River Company are made at the West Virginia-Ohio state line at a number of points along the Ohio River between Parkersburg and Sistersville, but principally at Marietta, Ohio. Deliveries to the Fayette Company are made at the West Virginia-

Pennsylvania state line at Wade Measuring Station and to the Manufacturers Company at Bates Measuring Station in northeastern Doddridge County, about 14 miles southeast of the Company's Hastings Compressor Station.

8. The properties of the Hope Company shown on Co.X.1 are its principal pipe lines, generally from 8 inch up to 20 inch in diameter, and its 47 active compressor stations. The pipe lines indicated in red, called "field lines" on the map, are the principal lines leading from a network of small gathering lines in the field to compressor stations. The lines indicated in green, called "transmission lines" on the map, carry the gas between the various compressor stations and from the compressor stations to points of delivery principally along the Ohio River and the Pennsylvania state line. The red squares indicate the Company's compressor stations, the largest being Hastings, approximately twenty miles southeast of the Ohio River. Hastings is the largest natural gas compressor station in the world.

9. The function of the Company's pipe line and compressor station system is to collect gas from its approximately 3,300 gas wells and from its 340 purchase contracts and to pump and transport that gas in a northerly direction and deliver it at the points of delivery heretofore described. Except for the local distribution systems shown by the green areas on the map and other smaller West Virginia communities these deliveries are all made to the north along the Ohio River, the Pennsylvania state line and at Bates in Doddridge County. It will be noted that the transmission system runs from the southern boundary of Boone County generally north to the delivery points heretofore noted. The pipe line distance from Clothier in Boone

—8—

County to Clarington and Round Bottom Stations on the Ohio River is over 178 miles. Each of these principal lines shown on the map is identified by a symbol. For example, the westerly discharge line leading from Hastings Compressor Station to Clarington on the Ohio River is marked H-106-20". This means Hope's line No. H 106, 20 inches in diameter.

10. The Company's gathering lines and wells and the points of receipt of gas from contract vendors are not shown, inasmuch as on a map of this size, these lines, wells and points of delivery would show as a solid network and would make the map illegible.

11. As shown on page 1 of Co.X.2 the Hope Company's actual mileage of pipe lines and their 3" equivalents as of the date of this map are as follows, classified in accordance with the Company's accounting records:

| | *Pipe Line Miles* | *Miles of 3" Equivalent* |
|---|---|---|
| Field lines | 2,381 | 5,076 |
| Transmission lines | 1,043 | 4,469 |
| Distribution lines | 892 | 929 |
| Total | 4,916 | 10,474 |

12. A word of explanation as to what is meant by "3-inch equivalent." The diameters of these various field and transmission lines range all the way up to 20 inches. It is, of course, misleading to compare a mile of 4-inch pipe, for example, with a mile of 20-inch pipe. To have some common equivalent to which all lengths of pipe is reduced it has become accepted practice in the industry to reduce everything to a 3-inch equivalent, i.e. a mile of 6-inch pipe is considered approximately two miles of 3-inch pipe, a mile of 18-inch pipe is considered approximately six miles of 3-inch pipe, etc.

—9—

13. As likewise shown on page 1 of Co.X.2 the Company's 47 compressor stations shown on Co.X.1 have a total installed horsepower of 93,470. As shown on page 1A, these stations vary in size from very small compressor stations located in the field, such as the Seth Station in Boone County with an installed horsepower of 180, to the Company's principal compressor station at Hastings in Wetzel County with an installed horsepower of 29,225.

14. Page 1 of Co.X.2 shows the other data as to the Company's properties which could not be shown on Co.X.1. As of December 31, 1938 it had 3,302 gas wells, 337,790 operated acres and 647,180 unoperated acres. These gas wells and gas leaseholds are widely scattered, principally through the central and northern parts of the West Virginia gas field in which the Company operates. The 340 contracts under which the Company buys gas supply gas to the Company from approximately 12,600 gas and combination gas and oil wells in addition to the gas wells owned and operated by the Company. Gas is received from these contract vendors at about 425 delivery points throughout the system with about 75% of the Company's purchased gas being delivered to it in the southern part of the system from Cabot Station in Calhoun County south.

—10—

## C. Hope's Gas Sales Obligations

(a) *Priorities in obligations*

1. The Company's distribution of natural gas in West Virginia is as a natural gas utility under the jurisdiction of the Public Service Commission of West Virginia. It serves in 22 West Virginia cities and towns, of which Clarksburg and Parkersburg are by far the largest, and in about 200 very small West Virginia communities. This local service in small cities and communities is a necessary incident of the Company's production activities. Columns (2) to (6) of page 2 of Co.X.2 indicate the extent of its sales in West Virginia, divided between domestic and commercial, industrial and field and other sales. The Company's approximately 42,000 domestic consumers in West Virginia have a primary right to be served in the event its available gas supply is not sufficient to meet all of its obligations. The Company's other sales in West Virginia are subject to curtailment in favor of domestic consumers of Hope in West Virginia and of domestic consumers of East Ohio and Peoples as hereinafter noted.

2. It will be observed from an examination of page 2 of Co.X.2 that the Company's West Virginia sales constitute a relatively small portion of its total business. All of these sales are made pursuant to rates subject to the jurisdiction of the West Virginia Commission and in accordance with the tariff schedules on file with that body.

3. The major portion of the Company's business consists of meeting its contractual obligations to East Ohio, Peoples, River, Fayette and Manufacturers, gas sold under these contracts moving out of the State of West Virginia

—11—

into the States of Ohio and Pennsylvania except for part of the gas sold to Manufacturers. A true copy of each of the Company's present contracts with these companies, as

on file with the Federal Power Commission as rate schedules under the Natural Gas Act, is made an exhibit in this case. These contracts are as follows:

| | |
|---|---|
| With The East Ohio Gas Company | Co.X.5 |
| With The Peoples Natural Gas Company | Co.X.6 |
| With The River Gas Company | Co.X.7 |
| With Fayette County Gas Company | Co.X.8 |
| With The Manufacturers Light & Heat Company | Co.X.9 |

4. The relative order of magnitude of the Company's sales under these contracts and under preceding contracts with these same companies is likewise shown on page 2 of Co.X.2. It will be observed by comparison of column (11) with the other columns on this page that Hope sales to East Ohio have for many years constituted far more than half of its total annual sales except for the years 1930 to 1934 when they dropped to about one half of the total sales. Hope's annual deliveries to the other four companies are very much smaller individually and in the aggregate than its sales to East Ohio.

5. While the terms of these five contracts are self-explanatory several general observations can be made. Under all of them Hope's first obligation is to supply the requirements of its domestic consumers in West Virginia. By its contracts with East Ohio and Peoples the Hope Company has obligated itself to supply the requirements of domestic consumers of those two companies and in case of shortage, after supplying its own domestic consumers, to

cut them back ratably in proportion to the number of domestic consumers attached to their lines. The gas sold by Hope, East Ohio and Peoples for industrial purposes is all subject to curtailment and has been curtailed whenever necessary to meet the demands of the domestic consumers of Hope, East Ohio and Peoples. Hope's contract with River specifically makes its requirements subject to the

prior rights of the domestic consumers of Hope and to Hope's obligations to East Ohio and Peoples. Its contracts with Fayette and Manufacturers specifically subject their requirements to the prior rights of the domestic consumers of Hope, East Ohio and Peoples. In other words, whenever necessary to supply the requirements of the domestic consumers of Hope, East Ohio and Peoples, deliveries to River, Fayette and Manufacturers may be curtailed.

6. Page 3A of Co.X.2 shows the number of the domestic and commercial consumers of Hope, East Ohio and Peoples for the individual companies and in total from 1899 to 1938. It is these consumers which Hope is under a primary obligation to supply.

(b) *Quantities required to be delivered*

1. Generally as to the quantities of gas which Hope is obligated to deliver under these contracts, Hope has an open commitment as to both East Ohio and Peoples to supply the requirements, whatever they may be, of the domestic consumers of these companies. In practice this obligation has been interpreted to mean all the requirements of East Ohio and Peoples that they are unable to satisfy from their respective fields in Ohio and Pennsylvania. This has resulted

in wide variations in the demands of these two companies from year to year, from month to month, from day to day, and from hour to hour.

2. In the case of River, Hope is obligated to meet the requirements of River's consumers in various Ohio cities and towns to the extent that River does not obtain its supply from other sources. In recent years Hope has supplied an average of about 30% of River's annual requirements. This is a small company and no substantial annual quantities of gas are involved, as will be seen from examining column (9) on page 2 of Co.X.2.

3. In the case of Hope's contracts with Fayette and Manufacturers, provision is made in each contract for a specified annual quantity of gas to be delivered by Hope and specified percentages of this total annual quantity to be delivered in each month and from day to day. The present Fayette contract specifies the annual quantity at 850,000 M.c.f. and the Manufacturers contract specifies the total annual quantity to be delivered by Hope at 2,500,000 M.c.f. until April 30, 1940 and at 2,000,000 M.c.f. annually during the next two years. The result is that under these contracts with Fayette and Manufacturers, Hope knows precisely what deliveries it is expected to meet annually, each month and from day to day, whereas in the case of East Ohio and Peoples these quantities are not known.

(c) *Pressure obligations*

1. In addition to the differing quantities of gas which Hope is obligated to deliver under these five contracts mention should be made of the differences in delivery

pressures. Under its contract with East Ohio, Hope is required to deliver gas at a pressure where its lines join the lines of East Ohio of at least 225 pounds and in practice for many years deliveries have been made in the winter season at pressures between 285 and 300 pounds. The final compression necessary to accomplish these deliveries occurs largely at the Hastings Station where the discharge lines to the Ohio River carry pressures up to 325 pounds. Additional deliveries by Hope to East Ohio in times of peak demand are made through the Peoples system, which connects with the East Ohio system at Petersburg south of Youngstown, Ohio. All gas sold by Hope to East Ohio is delivered to East Ohio at sufficient pressure so that it will flow through East Ohio's lines to consumers' burner tips throughout the East Ohio system. East Ohio does not further compress any of the gas it purchases from Hope. On

maximum peak days Hope delivers to East Ohio at Clarington and Round Bottom Stations on the Ohio River up to 165,000,000 cubic feet and at Petersburg around 8,000,000 to 9,000,000 cubic feet additional. On gas delivered to East Ohio at Petersburg, Hope pays Peoples a compressing and transportation charge.

2. Under its present contract with Peoples, Hope is obligated to make deliveries to Peoples at such pressure as Peoples may from time to time request and as can be maintained by Hope without increasing its pipe line or compressor station capacity. Most of the deliveries to Peoples are made at pressures varying from about 50 to 160 pounds directly into the suction lines of Peoples' Brave Compressor Station, where the gas purchased from Hope is compressed sufficiently to transmit it to Peoples' markets. In addition deliveries are made through Hope's lines H

29-8" and H 27-10", which are connected to lines of the Peoples Company feeding into the low stage pumps at Brave Station. These low stage pumps pull the pressure on these lines of Hope down to about 5 pounds. In other words, the gas delivered through these two Hope lines is drawn out of the Hope lines and wells directly by compressors at the Peoples' Brave Station. This particular gas has to be pumped twice by the Peoples Company at its Brave Station to reach its markets. In periods of extreme demand, deliveries are also made to Peoples through Hope's line H 6-16" from Hastings Compressor Station, at state line pressures of about 100 pounds. Normally this line serves as a suction line into Hastings Station. When deliveries are made through this line to Peoples, it further compresses this gas at Brave Station to reach its markets.

3. The prices fixed in both the East Ohio and Peoples contracts contemplate delivery of gas by Hope with pressures sufficient to reach the consumers served by these two companies. Since Hope's deliveries to Peoples are not at

sufficient pressure to reach Peoples' markets and Peoples must compress the gas purchased from Hope at its Brave Compressor Station, the contract with Peoples provides for payment by Hope to Peoples of 3¢ per M.c.f. so long as Peoples maintains its Brave Compressor Station.

4. Hope's delivery pressure obligations under its contract with River read substantially like those of its contract with Peoples and in practice deliveries are made at pressures of about 35 pounds.

5. Hope's Fayette contract provides that delivery pressures will be sufficient to meet the requirements of

Fayette, which in practice has meant deliveries at field pressures of about 60 to 100 pounds at the delivery point at Wade on the West Virginia-Pennsylvania state line.

6. For several recent years Fayette has taken gas from an isolated Peoples system well in Fayette County, Pennsylvania, and Peoples has secured an equivalent amount of gas from Hope without charge over and above its contract takings. The gas so exchanged is billed as if delivered by Hope to Fayette at Wade.

7. In the case of Manufacturers, Hope's delivery pressure obligation is specified at not less than 60 pounds and in practice deliveries are made at field pressures ranging from about 60 to 70 pounds. It will be recalled that these deliveries are made at Bates in Doddridge County, West Virginia in the middle of Hope's own production system. These deliveries go immediately into the suction lines of Manufacturers' Sedalia Compressor Station which pumps this gas and Manufacturers' own local supplies for delivery in Pennsylvania and elsewhere.

(d) *In general*

1. From this brief review it will be noted that Hope's contract obligations both as to quantities and delivery

pressures vary substantially between its five major gas sales contracts, with its obligations to East Ohio and Peoples and its delivery pressures to East Ohio calling for substantially greater service than in the case of the other contracts.

—17—

## D. Annual Demands Resulting From Hope's Gas Sales Obligations

1. In view of the character of the Company's gas sales obligations, particularly its open-end obligations to East Ohio and Peoples, it is apparent that the extent of the demands upon the Company's system must be determined by an analysis of what has actually happened in addition to what the Company's various contracts say. This analysis requires an examination of the statistics as to both the annual demands upon the Hope Company's system and the peak load demands. This portion of this exhibit deals with the annual demands upon the Company's system and the next portion will discuss the peak load problem.

2. Co.X.2 at pages 2 to 9 sets forth the statistics as to these annual demands both in statement and chart form.

(a) *Annual demands from West Virginia consumers*

1. On page 2 of Co.X.2 there is shown the number of West Virginia consumers of Hope, the amount of gas sold in West Virginia for various purposes and in column (6) the total West Virginia sales, for the 40-year period 1899 to 1938. It will be noted from columns (2) and (3) that the number of domestic and commercial consumers as well as the amount of domestic and commercial sales has gradually increased over the years and Hope now supplies annually about 4½ billion feet to its own 42,000 consumers.

2. Column (4) shows the West Virginia industrial sales of Hope. In 1921, due to the depression of that year, industrial sales fell sharply. They did not again reach their pre-1921 level until 1936 and 1937. These West Vir-

—18—

ginia industrial sales are largely steady load gas, principally because of the glass and some other similar industries whose normal operations are continuous.

3. In column (5) it will be noted that from 1902 to 1908 Hope's West Virginia field sales were very large, reaching a peak of 20 billion feet in 1904. They have now declined to less than 1 billion feet per year. In the boom period of oil and gas exploration in West Virginia large amounts of gas were sold in the field for drilling operations. It was burned in huge quantities under boilers. With the boom period over, there is no longer the demand for this gas in the field.

4. Column (6) shows Hope's total West Virginia sales. The relatively small proportion of Hope's total sales represented by these West Virginia sales appears from a comparison of columns (6) and (12). The chart on page 3 of Co.X.2 illustrates these figures, the various shades of blue representing the Company's various West Virginia sales.

(b) *Annual demands from Manufacturers and Fayette*

1. These two companies both belong to the Columbia Gas & Electric group. The only precise statistical information Hope has available as to them is its sales to each of these companies. Published reports, however, show that Manufacturers secures the greater part of its supply from sources other than Hope. Hope's yearly sales to these companies are set forth in columns (7) and (8) on page 2 of Co.X.2 and in graph form on page 3. It will be noted that the annual sales to Manufacturers were rather stead-

—19—

ily around 9 billion feet from 1910 to 1915, both inclusive; then for two years were at 14 billion feet; for two more years at 12 billion feet; for two more years at 11 billion feet; for the succeeding ten years from 1922 through 1931

they were around 10 billion feet and in recent years have been from approximately 7 to 5 billion feet. It will also be noticed from column (8) that Hope's sales to Fayette County Gas Company follow a similar uniform pattern, the sales of the last ten years being less than 1 billion feet each year.

2. The reason for this consistency in groups of years is that the quantities to be delivered by Hope each year to Manufacturers have always been fixed in advance under the contract. The same situation has been true of the Fayette deliveries for many years. In the case of East Ohio and Peoples, however, Hope's obligation is to supply the requirements of their domestic consumers whatever these may be. A glance at the chart on page 3 of Co.X.3 will show that this open obligation to East Ohio and Peoples has produced great fluctuations up and down over the years in the sales by Hope to East Ohio and Peoples.

(c) *Annual demands from River*

1. The River Company was not physically connected with the Hope Company's lines until the year 1910 in which year Hope made its first deliveries to River. Co.X.2, pages 2 and 3, shows that Hope's annual sales to this small company have always been a minor portion of its total business.

2. In Co.X.2, page 4, is set forth the statistical information as to the amount of gas handled year by year,

by the River Company and the source of that gas. It will be noted that while the River Company procured the major part of its supply from Hope down to and including the year 1921, since that time it has procured the bulk of its supply from its own production and purchases and that in the year 1938 it purchased from Hope less than ¼ billion feet. This same data is shown in chart form on page 5 of Co.X.2.

(d) *Annual demands from Peoples*

1. While the Peoples Company had been in business since 1885 it was not until 1904 that its lines were connected with those of Hope and deliveries of West Virginia gas began. The general territory in which Peoples operates has already been described. It had on December 31, 1938, nearly 124,000 (now by consolidation with another company, 149,000) consumers attached to its lines and in the last five years has handled an average of 17 billion feet annually of which 22% was purchased from Hope.

2. In Co.X.2, page 6, is set forth the total amount of gas handled by Peoples from 1903 to 1938, both inclusive, and the amount and percentage of that gas purchased from Hope and produced and purchased in Pennsylvania. This data is shown in chart form on page 7. Note that this Peoples chart is shown in billions of cubic feet per year, as is the subsequent East Ohio chart, whereas the preceding River chart was shown in millions of cubic feet.

3. Column (4) of page 6, Co.X.2 shows that the demand upon Peoples for gas was generally upward from

1903 until it reached a peak in the year 1916. In that year Peoples marketed almost 41 billion feet. From this point Peoples' sales dropped in three years to less than 26 billion feet and following the depression of 1921 remained in the neighborhood of 20 billion feet until the depression of 1931. From 1931 to 1935 they dropped to 15 billion feet or less, went up to nearly 21 billion feet in 1937 and in the year 1938 were again 15 billion.

4. Peoples' maximum annual sales in 1916 and for a year or two before and after were caused by the industrial demands of the World War when other fuels were both expensive and difficult to obtain. Over half of the gas sold in this period was for industrial fuel purposes.

5. Reference to column (3) shows that the amount of gas produced and purchased in the Pennsylvania fields

has varied widely from year to year. The discoveries that have been made in Pennsylvania over the years have not been as large as those that occasionally occurred in East Ohio's territory hereinafter discussed, but they boosted the Pennsylvania production available to Peoples from a low of 8½ billion in 1911 to a high of 20 billion in 1920, and have maintained an average of about 15 billion for the three years 1936-1938.

6. The effect of declining sales after 1916 plus the additional discoveries in the Pennsylvania fields is shown in column (2). Hope's deliveries to Peoples reached a peak of 26 billion in 1916, declined to 6½ billion in 1919 and have further declined in the last fifteen years to less than 4 bil-

lion. The decline from 1916 to 1919 and for a few years thereafter was in part caused by the inability of Hope and Peoples to supply fully the industrial demands of that period.

7. The decline in Hope's annual sales to Peoples from over 26 billion feet in 1916 to 6½ billion feet in 1919 was a reduction of 19½ billion feet. This decline was made up of 4½ billion feet increase in the quantity of gas taken by Peoples from the Pennsylvania fields and the remaining 15 million feet was a reduction in Peoples' sales as well as those of Hope. Since the World War period Peoples has been able to supply a larger percentage of its total requirements from the Pennsylvania fields than theretofore, with the result that Hope's annual sales to Peoples in recent years have ranged from 3 to 4 billion feet per year.

8. The percentages of Peoples' annual supply purchased from Hope shown in column (5) vary widely from year to year. Beginning with the first full year that Hope was supplying Peoples, viz. 1905, they show a range from 73% furnished in 1912 to 5% furnished in 1925. Taking the 36-year average Hope has supplied Peoples with 38.7% of its total annual requirements, but in the year 1938 sup-

plied less than 19% of its annual requirements. Under present conditions it is anticipated that Peoples will require larger annual deliveries from Hope than for some time in the past unless immediate discoveries are made in the Pennsylvania fields.

9. The graph on page 7 of Co.X.2 shows at a glance the large purchases made by Peoples from Hope between 1906 and 1918, the decline in those purchases since that

year and the increased quantities of gas obtained by Peoples from other sources than Hope between the years 1913 and 1931 and again from 1935 to 1937.

(e) *Annual demands from East Ohio*

1. East Ohio was Hope's first and has always been its largest customer. Both companies were organized in 1898, at which time East Ohio accepted its first franchise for distribution of gas in the City of Akron, Ohio. Other franchises followed soon after and at the present time East Ohio distributes natural gas in Cleveland, Akron, Canton, Massillon, Youngstown and other Ohio municipalities, in all over 60, and has almost 500,000 domestic consumers connected to its lines. In the last three years East Ohio has handled annually an average of about 47 billion feet of gas of which Hope has supplied 70%.

2. Page 8 of Co.X.2 shows the total amount of gas handled by East Ohio during the 40-year period 1899 to 1938 both inclusive, and the source of its supply. Page 9 shows this same information in graph form.

3. Attention is called first to the total amount of gas handled by East Ohio shown in column (4) on page 8. It will be noted that the quantities of gas handled by it each year increased rapidly and continuously from 1899 to a peak in the year 1916 when it handled 64 billion feet. In the next few years its sales dropped until for the past

20 years its sales have fluctuated from a low of 35 billion in 1932 to a high of 50 billion in 1937, the average for this period being over 42 billion feet.

4. In column (5) is shown the per cent of East Ohio's annual demands met by Hope deliveries and in column (6)

—24—

the per cent met by production and purchases in the Ohio fields. From column (5) it will be noted that down to the year 1913 Hope was practically the sole source of supply for East Ohio; that two years later in 1915 Hope supplied only 38% of East Ohio's requirements, the balance coming from the Ohio fields; that in the following year Hope supplied 70% and until about the year 1927 continued to supply about 75% or more at which time the percentage supplied by Hope again began to decline, reaching a low of 51½% in 1932. Since that time it has increased until it is now again approximately 70%.

5. These two low points in East Ohio's demand on Hope in 1915 and again in 1932 illustrate one of the hazards of a producing natural gas company, dependent upon distant and fluctuating markets, such as Hope is. As shown by column (3) East Ohio had no Ohio production or purchases of any consequence until the year 1913. At that time a large field of gas was discovered in Lakewood immediately adjacent to the City of Cleveland. It was developed largely by independent operators drilling on very small plots of ground with the result that the field was quickly developed and was quickly depleted. In 1914, the second year of the Lakewood field, East Ohio took in Ohio nearly 18 billion feet and the next year over 32 billion feet. Although its demands in these years, as shown in column (4), had constantly increased, the result of these large purchases in Ohio was to reduce purchases from Hope from 32 billion feet in 1913 to 20 billion feet in 1915.

6. After the flush production of the Lakewood field had been taken, East Ohio continued to obtain from the

—25—

Ohio fields about 10 billion feet a year down to and including 1926. In 1927 a field known as the Franklin-Jackson field in Summit and Stark Counties was discovered. This field reached its peak in 1932 in which year East Ohio took 17 billion feet from the Ohio fields. Annually from 1929 to and including 1937 it has taken around 15 billion feet from the Ohio fields. In 1938 it took 12½ billion feet in the Ohio fields.

7. The effect of the discovery of this Franklin-Jackson field on Hope's sales to East Ohio is shown in column (2). In 1929 East Ohio called upon Hope for 32 billion feet but in 1932 for only 18 billion feet, a decrease of 14 billion. More significant still, East Ohio's demand declined 12 billion feet between 1929 and 1932, shown in column (4), while its purchase and production of Ohio gas increased 2 billion feet, shown in column (3). In other words, while East Ohio's market declined 12 billion feet in those 4 years it did not place this loss of market proportionately upon the Ohio gas and the Hope gas but increased its takings of Ohio gas and thus threw on Hope not only the entire shrinkage in the market but further curtailed Hope by several additional billions of increased takings from the Ohio fields. This aggravated the natural decline in Hope's business due to depression years.

8. Taking the average of the 40-year period East Ohio has been dependent upon Hope for its supply to the extent of 73.3% and was dependent upon Hope in the year 1938 to the extent of 70.7%.

9. Reference to the graph on page 9 of Co.X.2 shows at a glance the effect of the tremendous production obtained

—26—

from the Lakewood field for a short time following the year 1913. It also shows the more gradual building up of the Ohio supply that followed the discovery of the Franklin-Jackson field in 1927. Actually these two discoveries from

a point of view of total volume are more nearly of equal weight than this graph would indicate. The Lakewood field was exploited wastefully and rapidly as a town lot development. Accordingly it quickly rose to a peak in 1915 and as quickly declined. On the other hand the Franklin-Jackson field was developed principally by East Ohio itself and one or two other large operators. The development was sound and economical with the result that the gas was drawn out steadily over a long period of years without waste.

(f) *Total annual demands on Hope*

1. Page 2 of Co.X.2 is a summary of both the total sales and total gas handled by Hope for the years 1898 to 1938, both inclusive; page 3 shows the same data in graph form. Column (12) of page 2 shows the total sales and the preceding columns the classification of those sales. Columns (13), (14) and (15) show the quantities of gas that the Company produced annually but which was not sold. This consisted of free gas to lessors where leases so provided, gas used by Hope in its own operations for drilling, operating compressor stations, etc. and leakage or unaccounted for gas which has been estimated in column (15) for each of the years. These totals added to the actual sales give the total quantity of gas handled.

2. Referring to the total sales of Hope in column (12) the peak year of 1916 is immediately apparent. It is also

apparent from pages 6 and 8 that Hope did not get its share of the increasing demands of 1914 and 1915. These demands were much larger on East Ohio than those of 1913. Yet Hope's sales in both 1914 and 1915 were materially less than in 1913. As already explained this was principally due to additional discoveries in Ohio. The tremendous decline in Hope sales between 1916 and 1919 stands out sharply.

3. The effect of the world-wide depression that began in 1930 and has continued intermittently since that time is clearly shown in column (12). Hope sales in 1932 and 1933 were a little more than 37 billion, rising from that to nearly 59 billion in 1937 but again declining to 48 billion in 1938.

—28—

**E. Daily Demands Resulting From Hope's Gas Sales Obligations**

1. As heretofore indicated, under its public service and contractual obligations the Hope Company's first duty is to supply the domestic consumers of itself in West Virginia and of East Ohio and Peoples in Ohio and Pennsylvania. It has an open-end commitment as to these consumers and it is therefore important to an understanding of the Company's business and its actual obligations to know the character of the domestic demands upon Hope as distinguished from other types of businesses.

2. The outstanding characteristic of this domestic business is that it fluctuates widely from day to day with the weather and can only be determined to the extent that temperatures and wind velocities can be predicted. While annual industrial demands vary with general business activity, they are comparatively steady, day by day, and predictable in advance for current operating purposes. Principally by reason of the domestic demands the Company's actual sales obligations vary more widely on an hour to hour and day to day basis than on the annual basis heretofore discussed.

3. By way of illustration of this general situation, which is self-evident to natural gas men working in the Appalachian field, the charts on pages 10, 11, and 11A of Co.X.2 have been prepared. Page 10 shows the approximate day by day sales by Hope and East Ohio to the domestic and industrial consumers of these two companies for the year 1936. The combined East Ohio and Hope ap-

proximate daily industrial sales are shown by the light lines at the bottom of the chart and the approximate daily

—29—

sales to domestic consumers by the black lines on the top of the chart. Page 11 shows the same type of statistics for the year 1938 and page 11A for the six months ended January 31, 1940. It might be noted that the East Ohio estimates reflected on these pages are based on inputs into the East Ohio system and a subtraction of estimated daily industrial sales, field sales and gas used in operations from the total inputs to ascertain the approximate daily sales to domestic consumers. This method considerably understates East Ohio's sales to domestic consumers on days of extreme demand. On such days part of the deliveries to consumers are of gas previously packed into the lines at high pressures which pressures fall as greater and greater demands are met.

4. Generally it should be observed that the year 1936 was a year of larger annual sales for both Hope and East Ohio than the year 1938 as will be apparent from columns (12) on page 2 and (4) on page 8 of Co.X.2.

5. From the chart for 1936 on page 10 it will be seen that generally during the first six months of that year the industrial demand on Sunday of each week did not vary greatly from 60 million M.c.f. On Mondays this demand rose to about 70 million. On Tuesday, Wednesday and Thursday, it held between 70 and 80 million. On Friday the demand dropped back to below 70 million, and on Saturday to between 40 and 50 million. The pattern for each week is the same. On only three days during these six months, including the very severe weather of January and February of 1936, did it exceed 80 million feet.

—30—

6. During the last half of the year 1936 the pattern is much the same and the quantities are the same except that somewhat increased industrial activity is indicated by the

fact that on some week days of the last three months of the year the demand rose slightly above 85 million.

7. For the year 1938, shown on page 11 of Co.X.2, the pattern of industrial demand each week is again the same, although the industrial demands throughout that year were lower than in 1936. In the first half of 1938 it was only an occasional day when the demand exceeded 60 million. This situation continued until the fall of that year when the demand increased slightly but reached 80 million on only one day.

8. The domestic demand on the other hand varied widely from month to month and from day to day. As shown on page 10, on February 18, 1936 the domestic demand was around 180 and on February 19 it was 185 million although February 25 it was only 105 million, a drop of 80 million per day in less than a week.

9. If we compare the week beginning February 16, 1936, with the week beginning August 16, 1936, immediately below it on the chart, page 10, it will be observed that the industrial demand was about the same day for day in August that it was in February, beginning at about 55 million on Sunday, rising to 70 on Monday and holding there on Tuesday, Wednesday and Thursday, declining to about 60 million on Friday and to 40 million on Saturday. The domestic demand, however, for August on Sunday, the 16th, was only 30 million compared with 135 for the corresponding Sunday in February. On August 17, it was 55 compared with 140 in February. On the 18th it was be-

tween 55 and 60 compared with 180 million. On the 19th it was 50 million compared with 185. On the 20th it was 55 million compared with about 170. On the 21st it was 45 compared with 170 and on the 22nd it was 55 compared with 165.

10. Taking these corresponding weeks in February and August in their totals, the domestic demand for the

week in August was 350 million and for the corresponding week in February was 1150 million or over three times as great. The totals of these same weekly demands in February and August for the industrial consumers were about the same.

11. As to the temperatures prevailing during the years 1936 to 1938, the months of January and February of 1936 were much colder than January and February of 1938 and it will be noted from a comparison of the charts at pages 10 and 11 that the demand for domestic gas was much greater in these months during 1936 than in similar months during 1938.

12. The most recent severe cold spell experienced by the Company occurred in January 1940 and the chart appearing at page 11A of Co.X.2 shows the estimated daily sales to domestic and industrial consumers by Hope and East Ohio for the six months ending with January 1940. For the last two days of December 1939 and for January 1940 these figures exclude sales by Hope which were formerly made by Reserve Gas Company whose properties Hope acquired on December 30, 1939.

13. Comparing January, 1940 on page 11A with January and February, 1938 on page 11 and January and February, 1936 on page 10, it will be observed that East Ohio's and Hope's total daily sales to domestic and industrial consumers reached greater peaks and with more fre-

quency in January, 1940 than in either the comparatively mild winter of 1937-1938 or the extremely cold winter of 1935-1936. For example on at least six days in January, 1940 the combined domestic and industrial sales exceeded 260 million cubic feet whereas 260 million cubic feet was approached only once in the periods covered by the preceding charts, namely on January 23, 1936 as shown on page 10.

14. Comparing the black bars in these charts, which show the combined domestic sales of the two companies, it will be observed that the demands of domestic consumers were substantially higher in January, 1940 than during the last severe cold spell during January and February, 1936. During 1936 the combined domestic demand never exceeded 200 million cubic feet. On January 19, 1940 it exceeded 225 million cubic feet. Actually, as noted above, both the 1936 and 1940 sales to domestic consumers on peak days were considerably larger than the figures shown on the charts by reason of the fact that the East Ohio domestic estimates are based on input figures and do not take into account gas sold from line pack. Thus on January 18, 1940 East Ohio's system inputs were about 230 million cubic feet, whereas a study of meters measuring gas going into East Ohio's city distribution plants indicated total sales on this day were about 242 million cubic feet.

15. The chart on page 11a again illustrates the comparative steadiness of industrial demands as between the winter and the summer months and the extremely fluctuating character of domestic demands which was commented upon above in connection with the 1936 chart on page 10. Also attention might be called to the fluctuations that oc-

cur in domestic demands even during such cold months as January, 1940. On January 13 the combined East Ohio and Hope domestic demand was only 114 million cubic feet, this being on a Saturday. On the following Friday, January 19, the domestic demand exceeded 225 million cubic feet.

16. As later explained, so great were the demands of domestic consumers during the period January 18 to January 21, 1940 that East Ohio had to curtail drastically its sales to industrial consumers, and it was only by such curtailment, the industrial curtailments by Peoples and the curtailment by Hope of Manufacturers that the demands

of domestic consumers were met. The light bars for January 18, 19, 20 and 21, 1940 on page 11A show the effect on industrial sales of this curtailment.

—34—

**F. Method of Operating Hope's Properties**

1. The Hope Company's properties have been developed and are operated to meet its gas sales obligations as heretofore described. As will be apparent, its operating problems and the extent of the gas supply which it must have available are dependent not only upon its annual delivery obligations but upon the varying daily and hourly demands which it must meet.

2. As heretofore stated, the demands which Hope is obligated to supply come generally from two classes of consumers, domestic and industrial. Industrial demand does not vary with the weather but with industrial conditions. Thus in years of great industrial activity such as 1916, 1929 and 1937 it is relatively high and conversely in periods of industrial depression such as 1921 and 1932 it is low, but at all times it is fairly uniform throughout the seasons and from week to week.

3. The domestic load on the other hand depends on the weather. As noted above, through June, July and August of each year it is a fairly steady load for cooking, hot water heating and refrigeration that does not vary widely from day to day, but during the balance of the 12 months, and particularly in the wintertime, it increases or diminishes rapidly. Freezing temperatures and a high wind off Lake Erie cause instant demand from East Ohio's domestic consumers for all the gas that Hope lines can carry. So with falling temperatures and winds in Western Pennsylvania. A few days later the wind dies down, more moderate temperatures prevail and the demand on Hope goes off accordingly.

—35—

4. Hope may thus be called upon to handle on a peak day more than 325 million cubic feet and a few days later be handling only two-thirds of that amount and in the summer following less than one-fourth that amount.

5. These demands that may rapidly increase and as rapidly diminish must be met by turning on and turning off wells in the producing fields. In order that Hope's methods of keeping itself informed as to these varying demands and of operating its properties to meet them may be understood some discussion of its operating methods are necessary.

6. Hope's main office is in Clarksburg, West Virginia. From this office all field operations are directed. Located there are gas dispatchers on duty 24 hours of each day throughout the year. Their duties are extensive.

7. Hope has its own telegraph and telephone system and the dispatchers are in touch at all hours of the day and night not only with every part of Hope's system but with many points of consumption on the Peoples and East Ohio systems.

8. It is the gas dispatcher's responsibility to order wells owned by Hope turned on and off as the fluctuating load on the Company's system demands. When there is needed more gas at points of delivery the dispatcher likewise orders on additional engines in the various compressor stations so as to increase the amount of gas flowing through the system.

9. As an illustration and referring to the map, Co.X.1 and 1A, if the gas dispatcher at Clarksburg finds that he needs additional gas coming into Hastings Station he may order more compressors started in Smithburg, Schutte

—36—

and Jones Station to increase the flow of gas to Hastings. At the same time he will have to start more engines at Hastings to get the gas away to Cleveland. When he orders

compressors on at Jones, for instance, ordinarily he would also order more wells turned into the lines in the vicinity of Jones in order to supply the Jones Station engines with sufficient gas to pump. The same is true of the 47 stations in the Hope system which are handled the same way.

10. On a hard pull the dispatcher has practically all the engines and all the compressor stations on the Hope system running. Then when the weather moderates the dispatcher has to reverse the whole process, shut down the compressor station engines and take off wells in the field. He will frequently take hundreds of wells off the line in one day due to warm weather coming in the middle of the winter, and a few days later put them all back on. In other words he must meet from hour to hour and day to day the demand coming on the entire system and frequently these changes in demand come with little, if any, advance notice.

11. Hope's producing territory in West Virginia is divided into 15 working districts, each having its own headquarters. During the daytime the gas dispatcher can get in touch with the district office to orders wells on and off. During the night there are at least two or three men in each district who have Company telephones in their homes where the gas dispatcher can get hold of them and these men can get in touch with the well tenders and get their men out. In winter full crews are maintained at compressor stations. Every compressor station on the system that

is operating reports to the gas dispatcher at Clarksburg every hour of the day and night telling how many engines are running and the suction and discharge pressures and the pressures carried on each engine. The dispatcher can thus tell at all times what the pressures are on the entire system and whether his orders to start or stop engines have been carried out.

12. The gas dispatcher also at all times knows the number of wells on the line and where these wells are located. If he orders 100 wells on in a certain district the district headquarters immediately sends out men to turn these wells on and as soon as they are on the line the district reports back to the dispatcher stating the wells that are then feeding on the line. In the same way wells are turned off and reported back to the dispatcher. In consequence he knows at all times how many wells he has feeding into the system.

13. Hope, of course, has not the same control over the wells of its vendors. With the exception of its first contract with Godfrey L. Cabot in 1918 in which uniform daily takings throughout the year were required, its major gas purchase contracts call for certain deliveries in the wintertime and for lesser amounts in summer, usually one-half to one-third as much. These deliveries are in both instances in nearly uniform daily amounts, i.e. a uniform amount during the winter season and a uniform amount during the summer season. On the average about 60% of the Company's purchased gas is taken in the winter and about 40% in the summer. In consequence the dispatcher at Clarksburg knows just about how much purchased gas

on any day is coming into the system and he uses Hope's own production which alone is fully under his control to make up the difference between this purchased gas and the demand.

14. The gas dispatcher also not only gets hourly reports from the compressor stations as above stated but he also receives reports of the pressures at Clarington and Round Bottom on the Ohio River, at Price Farm and Gross Farm along East Ohio's system and at Dunham and Richardson Stations at Cleveland. He also gets the pressures at Gross Farm for East Ohio's lines running east to Youngstown. Hourly reports as to temperatures at Cleve-

land and Pittsburgh are likewise wired to the dispatcher, as well as the Weather Bureau's daily forecast for these cities, which are transmitted to him as soon as received.

15. When these hourly reports show pressures dropping, for example on the East Ohio system, the dispatcher immediately has Hastings start up more compressors to increase pressures at Clarington and Round Bottom. When he does this he necessarily starts more engines in compressor stations in the field and turns on more wells in order to get more gas to Hastings. He does the same thing with respect to the Peoples system, getting pressure reports not only from Brave Station but also from Pittsburgh. He likewise watches pressure conditions on the Hope system at various points of distribution.

16. The gas dispatcher thus has the responsibility from hour to hour of routing the gas supply to the points which have the greater need for gas. For instance if he finds there is a more severe pull on the East Ohio system

than on the Peoples system, he can switch more gas toward Hastings, or in case East Ohio is not pulling so heavily on the gas supply, he can switch additional gas to the Peoples Company. Also, for example, if Parkersburg is making a hard pull on the gas supply, the gas dispatcher can divert certain compressor stations to the use of the Parkersburg system and, when this Parkersburg demand declines, he can turn these compressing stations around by manipulation of gates so that they will pump to Hastings Station. It also is the gas dispatcher's duty, in cases of apparent shortages of gas, to carry out the decisions of the operating officials as to ordering factories turned off and curtailing deliveries to the purchasers who are subordinate to the primary rights of the Hope, East Ohio and Peoples domestic consumers.

17. The Charts, pages 12 to 16 of Co.X.2, indicate the approximate daily gas requirements upon the Hope system

(exclusive of free gas to lessors) supplied respectively by produced and purchased gas for the period July 1935 to the end of January 1940, both inclusive. Each block of seven vertical lines is a week beginning with Sunday. The light lines toward the bottom of the chart show the amount of purchased gas each day and the solid black lines the amount of gas produced by Hope from its own wells.

18. It will be noticed at once from the upper half of the chart on page 12 for the period July 1935 through June 1936, that the amount of purchased gas was fairly uniform at about 70 to 80 million feet of gas per day until the end of October at which time it increased to about 120 million feet per day. During the great pull on Hope's system in late January and in February it increased to around

140 million and remained at about 130 million in March and April. May 1st the reduced summer takings began.

19. This change between the winter takings of purchased gas and the summer takings is characteristic of practically all Hope's major contracts which provide for smaller takings in summer than in winter. Generally in May, June or July Hope tries to get the scheduled summer deliveries out of the way as rapidly as possible in order to cut down during August when it will be noted deliveries dropped below 80 million per day. In the latter part of September and in October Hope attempts to make up any deficiency existing in summer deliveries. On November 1st winter deliveries are again resumed.

20. This system of having fairly regular deliveries each day from vendors requires the Hope production system to meet all of the fluctuations up and down of the total demands above this purchased gas and makes very large fluctuations in the amount of Hope's own gas that is sold from day to day.

21. For example it will be noted from the chart on page 12 that the amount of Hope's own production during

the months of July, August and September, 1935, was sometimes more than 75 million feet in one day and was sometimes practically zero. Also, it varied widely from day to day.

22. About January 23, 1936, for a period of a month Hope was faced with a most serious peak load situation caused by sub-zero temperatures in the Appalachian regions and it is perhaps worthwhile to take time to notice how it met those demands.

23. It will be noted from the chart on page 12 that as late as January 19 the total demand on the Hope system was about 200 million feet per day which was met by about

125 million purchased gas and 75 million produced gas. On January 23 the demand rose to about 290 million feet which was met by about 140 million of purchased gas and 150 million of produced gas. On January 27, and again on January 31, the demand was practically 300 million feet, of which 140 to 150 million was purchased and the balance produced. Then on February 19 the demand rose to 308 million feet, of which 143 million was purchased and 165 million produced. It should be noted that 3 days before, to-wit February 16, the demand was less than 220 million and 4 days later the demand was 200 million. In this period of excessive demand in late January and well through February, 1936, Hope did procure some slight help from its gas purchase contracts, deliveries of purchased gas being slightly increased during that period. But the major fluctuations up and down had to be met by Hope's own wells which were called upon to deliver as high as 165 million feet a day although six days later they were delivering less than 55 million.

24. Hope had to meet an unusual condition on January 22, 1936. At one o'clock in the morning of that day the temperature was 28° above zero in Cleveland with just a

normal winter load on the Hope system. The temperature rose to 32° at 4:00 A. M., held around there until 7:00 A. M. and then dropped 11° in two hours. At about that time Hope received word that a severe storm with lower temperature was headed toward Cleveland. By 6:00 P. M. the temperature had dropped to 4° below zero and at 10:00 P. M. it was 10° below. The same thing happened at Pittsburgh. This storm hit the two communities unexpectedly with only a few hours notice and it was necessary for Hope to call its well tenders late in the afternoon and have them work all night in a blizzard turning on wells.

—42—

25. On page 17 of Co.X.2, is shown day by day the number of Hope's wells, the wells available for use, i.e. not undergoing repair, below line pressure or otherwise unavailable, and the wells in use, i.e. turned into the line, during the winter of 1935-1936. It will be noted from column (7) that on January 21 Hope had 2,438 active wells turned into its lines. In the afternoon of the 22nd it called out its well tenders, had them work all night and on January 23 had 3,296 active wells on the line out of a total of 3,317 wells available for use. It will further be noted from the remaining figures in column (7) and those in column (10) that Hope kept substantially all available wells on the line until February 23 when the cold snap had abated and for the rest of the winter all demands were met by less than 2,500 wells.

26. The demands upon the Hope system shown by the succeeding charts, pages 13, 14, 15 and 16, never at any time exceeded 272 million feet per day until January, 1940, shown by the chart on page 16. As a matter of fact all the winter weather there shown until January, 1940, was moderate and less severe than normal.

27. During January, 1940, the Company was required to meet demands upon its system more severe than even those of January and February, 1936. On January 18,

1940, due to sub-zero temperature accompanied by stiff winds in Cleveland, Pittsburgh and elsewhere, the total demands upon the Company's system, exclusive of its sales obligations under the former Reserve Gas Company contracts, for the one day exceeded 323 million. This was

the greatest demand made on the Company's system since the World War period. This demand was met by 148 million feet of purchased gas and 175 million feet of produced gas from Hope's own wells, exclusive of the former Reserve Gas Company's wells. Even so, in order to meet the demands of domestic consumers, it was necessary for East Ohio and Peoples to curtail industrial users in Ohio and in the Pittsburgh district. Sales by East Ohio to both large and small industrial consumers were severely curtailed from Friday, January 19, to Monday, January 22, 1940, at which time the severe weather had somewhat abated. On January 19 East Ohio's curtailment and shut off orders affected deliveries to about 60 industrial plants. During this same period Hope's deliveries to the Manufacturers Light & Heat Company were curtailed.

28. The chart on page 16 shows this January, 1940 situation graphically and the tabulation of wells on page 22 which covers the entire year of 1939 plus January, 1940, indicates how all available Company wells were turned into the line and kept there continuously during the severe demands of January, 1940 in order to meet the Company's obligations to the extent they could be met. In particular the figures for January, 1940 on the chart at page 16 should be compared with those for July, 1939 appearing immediately above. This comparison illustrates both the tremendous differences as between the summer demands and the cold winter demands which the Company must be prepared to supply, and the manner in which winter peaks must be met from its own producing wells.

29. This method of meeting the Company's obligations which has been described—relying upon purchased gas for

—44—

rather steady deliveries from day to day and calling upon Company produced gas to make up the fluctuations in the total demand both up and down—is one of the operating difficulties and business hazards of the natural gas business. It is not normally possible to make favorable gas purchase contracts in West Virginia unless the buyer agrees to take regular deliveries of gas from the seller. The independent gas producer who has no public utility obligations makes his investments in leases and wells with the idea of recovering as much gas as rapidly as possible. He is not interested in conserving his supply for peak loads or in deferring deliveries. To propose to him a contract that he deliver gas in accordance with the extremely varying daily, monthly and annual requirements of Hope's business would not interest him at any reasonable price.

30. The consequence is that the large purchasers of gas in the West Virginia field are required to make a firm commitment for all the gas produced by the independent producer, with sometimes a maximum daily commitment, and to continue those purchases during the life of the wells. The only recognition of varying demands that the buyers have been able to procure is the variation between the winter and the summer takings.

31. It should also be pointed out that the independent producer operates his own wells. If Hope were dependent upon him to increase production rapidly in times of peak demand there would be no way of insuring his compliance with any such obligation. To turn on wells for a few days of peak demand is costly and requires the maintenance of

—45—

a separate organization for this purpose. An independent operator has no incentive for incurring these additional costs or for selling in such an irregular market.

32. It has therefore become customary in the natural gas industry for those companies that have public utility obligations for service to take care of the fluctuations in demand from their own producing fields. This enables them not only to meet peak demands promptly but to buy gas from an independent operator at a lower price than they otherwise would be required to pay.

33. At present Hope must hold itself in readiness at all times to meet a peak demand of 325 million feet or over, exclusive of the former Reserve Gas Company sales. From its contract vendors it can count on about 165 million feet. The balance of 160 million or more must come from its own wells. This means on winter days when the demand is for 200 million, Hope can sell only 35 million of its own gas and must hold in reserve 125 million feet for days of larger demand.

## STATEMENT OF EXPERIENCE AND QUALIFICATIONS OF GEORGE I. RHODES

**1. Name, address and age**

George I. Rhodes, 239 Forest Avenue, Glenn Ridge, Essex County, New Jersey; age 56.

**2. Education and professional societies**

Massachusetts Institute of Technology (B. S., 1905). Member of American Gas Association, American Society of Civil Engineers, and American Society of Mechanical Engineers and Fellow of American Institute of Electrical Engineers.

**3. Present position**

Vice President and Director of Ford, Bacon & Davis, Inc., an independent firm of engineers that has been engaged since 1894 in the design, the supervision of construction, the construction itself and the operation of industrial properties, natural gas properties and other public utility properties; as well as in valuation work and the preparation of reports relating to cost estimates for proposed construction, for proposed corporate mergers, and for sale and purchase of properties and of reports relating to other general engineering and corporate matters; also Vice President and Director of Ford, Bacon & Davis Construction Corporation, a wholly owned subsidiary, engaged directly in the construction of such properties.

—3—

The firm in addition to design and construction work has made valuations of more than $8,000,000,000 in properties in the last twenty years of which more than $1,250,000,000 have been gas properties. Among its important clients other than utilities and affiliates of Hope Natural Gas Company have been:

American Locomotive Company
American Radiator Company
American Rolling Mills Company
American Smelting & Refining Company
Armstrong Cork Company
Atlantic Refining Company

Borden Company
Botany Consolidated Mills, Inc.
Cities Service Oil Company
Crane Company
Endicott Johnson Corp.

General American Tank Car Corp.
General Cable Corp.
Ingersoll-Rand Company
B. B. & R. Knight Corp.

National Lead Company
National Refining Company
North American Cement Corp.
Pennsylvania-Dixie Cement Corp.
Phillips Petroleum Company
Plymouth Oil Company
Pure Oil Company

Quaker State Oil Refining Corp.
Remington Arms Company, Inc.
John A. Roebling's Sons Company
Scott Paper Company
Socony-Vacuum Oil Company, Inc.
Solvay Process Company
Susquehanna Silk Mills

Texas Corporation
Tide Water Oil Companies
Union Carbide & Carbon Corp.
United Air Lines Transport Corp.
United States Steel Corp.
Winchester Repeating Arms Company
Worthington Pump & Machinery Corp.

—4—

United States Government:
War Department
War Industrial Board
Alien Property Custodian
Emergency Fleet Corporation
Reconstruction Finance Corporation
(Loaned Chief Engineer for 2 years)

United States District Courts of:
Colorado, Delaware, Illinois,
Louisiana, New Jersey,
Southern District of New York,
Western District of Pennsylvania,
Eastern District of Pennsylvania

State of Louisiana, New Orleans Port Commission
State of New Jersey, State Tax Board
New Jersey Port and Harbor Development Commission
Port of New York Authority
Cook County, Ill. (Chicago), Department of Highways
Suffolk County, New York, water supply department

City of Chicago, water supply department
City of Indianapolis, municipal gas department
City of Los Angeles, municipal power and water departments
City of New York, Tax Commission
City of Philadelphia, Department of Transit
City of Seattle, Department of Lighting

**4. Employment and experience other than in the natural gas business**

(a) Summers while a student at Massachusetts Institute of Technology, surveyor in water works construction and laborer in public utility construction.

(b) 1905-6—Instructor in Electrical Engineering Laboratories of Massachusetts Institute of Technology.

(c) 1906-1911—Motive Power Department of Interborough Rapid Transit Co., New York, N. Y., at time of termination of employment being electrical engineer, having charge of all electrical design and, in addition, the construction and operation of all underground conduit and cable facilities of the motive power department of that company.

—5—

(d) 1911-1917—Consulting engineer in the Boston office of White Weld & Co., investment bankers, examining and reporting upon properties financed or about to be financed, or in respect of which changes in securities deposited under collateral mortgages were required or contemplated; and, in addition, participating in the executive direction of construction, development and operation of certain gas and electric properties controlled by or operated under the direction of one of the partners of that firm.

(e) 1917 to date—With Ford, Bacon & Davis, Inc., having general charge of all preliminary reports and estimates of proposed projects, all design and all construction work carried out by that firm, giving particular attention to power systems, both steam and hydro, to industrial plants and to bridges, in addition to the natural gas work outlined below.

**5. Experience in the natural gas and allied businesses**

In 1923, made an estimate of the gas reserves of the Monroe (Louisiana) Gas Field, as a result of which financing was arranged for the construction by Ford, Bacon & Davis, Inc. of the natural gas burning power station of Louisiana Power & Light Co., consuming more than 30,000,000 cubic feet per day.

Working cooperatively with an associated Vice President, E. O. Hill shared responsibility with him in various degrees in all natural gas development work carried out

under the direction of Ford, Bacon & Davis, Inc. and Ford, Bacon & Davis Construction Corp., included in which are the following:

—6—

Edmonton, Alberta, complete natural gas system, preliminary reconnaissance, design, supervision of construction and operation of completed property.

Monroe to New Orleans pipe line system with *Compressor stations, preliminary reconnaissance, purchase of gas reserves, design, construction and the operation of completed system.

Amarillo to Denver pipe line system with gasoline plant and compressor stations, *preliminary reconnaissance, design, supervision of line construction, actual compressor station and gasoline plant construction and the operation of completed system.

Monroe to Memphis and Jackson, Tennessee pipe line system construction.

Monroe to Eldorado (Arkansas) pipe line system construction.

*Monroe to St. Louis pipe line system *preliminary reconnaissance and *construction of pipe lines.

*Monroe to Atlanta pipe line system with compressor stations, *preliminary reconnaissance, *design, *supervision of line construction and *actual compressor station and *Mississippi River crossing construction, and the operation of completed system.

*Amarillo to Chicago pipe line system, preliminary reconnaissance, designs and costs estimates for one group of its promoters.

*Kansas section of Amarillo to Chicago pipe line *construction.

Illinois section of Amarillo to Chicago pipe line construction.

*El Paso to Douglas, Arizona and Cananea, Mexico pipe line system with compressor stations, *preliminary reconnaissance, *design and *supervision of construction.

*Amarillo to Kansas pipe line system, *design and *cost estimates of possible system contemplated to serve large part of State of Kansas.

*Amarillo to East St. Louis gasoline pipe line system with pumping stations, *design and *inspection of construction.

East Texas oil field to Shreveport oil pipe line construction.

Note: *Had prime responsibility on items marked with an asterisk. Associated Vice President E. G. Hill had prime responsibility on other items.

—7—

Charleston, West Virginia to Kentucky state line, a liquid propane pipe line, design and construction.

Toledo to Detroit gasoline pipe line construction.

Philadelphia to Reading, Pennsylvania gasoline pipe line construction.

Other miscellaneous natural gas, gasoline and oil pipe lines, primarily construction, aggregating several hundred miles in length.

The properties and parts of properties so constructed under the direction of Ford, Bacon & Davis, Inc. cost more than $125,000,000. In the case of certain of the properties included in the above costing more than $60,000,000 the operating organizations were built up and the properties operated by Ford, Bacon & Davis, Inc. for various periods of years.

Since the fall of 1935, have been principally engaged on matters relating to valuation, cost determinations and analyses of operations of natural gas properties.

For ten years or more have given particular attention to pipe line corrosion problems and resulting depreciation. Also made intensive technical, electrical and mathematical studies of corrosion phenomena as related to the life of pipe lines and have cooperated with the United States Bureau of Standards in such matters.

—9—

## WRITTEN STATEMENT OF GEORGE I. RHODES

### 1. Employment By Hope Natural Gas Company

Ford, Bacon & Davis, Inc., was employed to determine the reproduction costs new and less depreciation of the properties of the Company for the purpose of the proceedings before the Federal Power Commission in which this exhibit is presented. It has in recent years made such determinations of cost of properties of the Company in connection with rate cases of The East Ohio Gas Company, an affiliated company, before the Public Utilities Commission of Ohio.

From the beginning of the present work I have been in responsible charge of it. The detail work has necessarily been done by a staff of engineers, accountants and clerks.

The principal engineers and accountants comprising this staff are regular employees of Ford, Bacon and Davis, Inc. Their number exceeded 30 at times of greatest activity when field and office work overlapped. They were assisted by upwards of 40 others engaged for the purpose. Regular employees of the Company have assisted on matters where special familiarity with the records or the property was needed to carry out the work. This staff began work in March, 1939 and has been continuously engaged since in preparing the data and making the estimates described and summarized in this exhibit.

—10—

This exhibit gives the results of this determination of reproduction cost new and the inventory of the properties included in the determination and is divided into nine parts as follows:

PART A: Written Statement and Summary

PART B: Natural Gas Production Plant:
Account Nos. 330-1, 330-4, 330-5, 331-1, 331-2, 331-3 and 332-1

PART C: Natural Gas Production Plant:
Account Nos. 332-2, 333-1, 333-2, 334 and 337

PART D: Transmission Plant:
Account Nos. 351-12, 351-23, 352-2, 352-3, 352-4 and 353

PART E: Transmission Plant:
Account No. 354-2

PART F: Transmission Plant:
Account No. 354-2 (continued)

PART G: Transmission Plant:
Account No. 354-2 (continued)

PART H: Transmission Plant:
Account Nos. 354-2 (concluded), 354-3 and 354-4

PART I: General Plant:
Account Nos. 370, 371, 372, 373, 374, 375, 376, 377, 378 and 379

Reproduction cost new less depreciation is set forth in a separate Company exhibit.

—11—

## 2. The Properties of the Company Covered by This Reproduction Cost Determination

The properties and operations of the Company are fully described in Exhibits Nos. 1, 2, 3 and 4 by Mr. Loring L. Tonkin, President of the Company, and these property descriptions need not be repeated here.

The reproduction cost estimate set forth in this exhibit includes the properties of the Company which comprises its production and transmission plants and jointly used general plant, with the exceptions here noted. It excludes natural gas leaseholds and rights, working capital and going concern value. It excludes the pipe lines, compressor station and related properties used to transport coke oven gas purchased from Domestic Coke Corporation which is used by the Company as boiler fuel in connection with its natural gas operations. It also excludes those properties, includ-

ing distribution and general, used solely for distribution of gas in West Virginia.

The items of property covered by this estimate have been classified by the Company in accordance with the new uniform system of accounts for gas utilities prescribed by the Public Service Commission of West Virginia, effective January 1, 1939. This classification is similar to the uniform system of accounts for natural gas companies adopted by the Federal Power Commission, effective January 1, 1940. In this exhibit such classification by the Company has been adopted and the summary shows the new account numbers. For reference purposes the summary also shows the corresponding old account numbers under the West Virginia uniform system of accounts which became applicable to the Company on January 1, 1923.

—12—

### 3. Inventory of the Properties Covered by This Reproduction Cost Determination

The inventory of the operating units of the Company's properties used in this reproduction cost determination is as of December 31, 1938 and is the inventory prepared for use in connection with the determination of original cost under the new West Virginia classification of accounts.

This inventory is based on the Company's investment ledgers and other records, including those of the accounting department, those of the engineering and geological departments and those of the operating departments, and was coördinated and verified as necessary by field checks, inspections and surveys. In the process of verification use was also made of a detailed inventory of the Company's properties as of June 30, 1931 which was made and agreed upon in the 1931 *East Ohio-Cleveland* rate case before the Public Utilities Commission of Ohio by engineers representing the City of Cleveland, engineers of the Ohio Commission and Ford, Bacon & Davis, Inc., representing The East Ohio Gas Company.

Each operating unit of property was identified as to description and dimensions on the books and records of the Company and where necessary by engineers in the field. The several Company records relating to each such unit of property were compared and adjustments made for errors where found. Where appropriate the former agreed inventory relating to each such unit of property was checked in the field and was adjusted in detail to reflect all additions and removals from June 30, 1931 to December 31, 1938. An extensive field check was made of agreed quantities of work

—13—

entering into the construction of many units of property as shown in the 1931 inventory, as a result of which these quantities were found satisfactory for determining the reproduction cost of the property.

All the Company's major lines had been surveyed as a matter of Company record. The actual lengths of 265 miles of other pipe lines were determined by measurements to verify the Company's records. These new surveys confirmed the substantial accuracy of the Company's records relating to these lines.

Inventories of buried equipment such as valves and fittings in pipe lines and in compressor station yards were made from records and drawings and verified in the field to the extent possible. They could not of course be uncovered for measurement or detailed count. In making such inventories the identifiable groups of valves and fittings in necessary use were listed and details making up such assemblies were used in accord with accepted Company and industry practice.

The inventories so prepared and checked constitute the basis of the original cost determination referred to above and the basis of the reproduction cost determination here presented. The inventories in both cases are identical as to operating units of property.

**4. Basic Procedure Followed in This Reproduction Cost Determination**

This reproduction cost estimate of the Company's properties included in the inventory determined as set forth above is that which would be incurred through its reproduction for a newly-organized independent corporation as a major construction operation on a three year construction program. The estimated cost of raising the funds to pay for such construction has not been included.

—14—

The cost of reproduction is that applicable to the inventory of the Company's property as it existed on December 31, 1938 with labor rates and material prices those prevailing during the winter of 1938-1939 and with labor and equipment performances those of current experience. Since that time the level of these rates and prices has remained substantially the same.

The general methods of construction commonly used in large developments were applied in determining the reproduction cost of the Company's property. The Company would purchase all materials such as pipe, well equipment and compressor station equipment, etc. entering permanently into the construction, except building materials and like details. All such major materials would be delivered to contractors at nearest railroad sidings and the contractors would make the installation. In all building and miscellaneous construction, however, the contractors would furnish materials as well as labor. The installation of field meters and regulators and like detailed work closely associated with placing the property in operation would be carried out by the Company's own forces.

Material and equipment prices used are those quoted by manufacturers or vendors for materials and equipment of the specifications and quality used in the actual construction of the property. Prices were requested reflecting actual sales prices at the best discounts for materials and

equipment in the quantity required and reflecting the full purchasing power of an adequately financed construction operation of the size involved. Where equipment was no longer being manufactured as specified the costs of superseding equipment at lowest quoted prices of competent

manufacturers were used as a basis of pricing. Wrought iron pipe was priced as steel pipe. Well casing used as pipe was priced at the price per pound of line pipe, which is lower than that of casing.

Freight rates on material were equalized to average destination of that material so that in the priced inventory like items of equipment in different locations are priced at the same cost.

The labor rates used were the result of an extensive investigation of wages prevailing before and after the end of 1938 in construction work and in industry in and about the territory occupied by the Company's property.

Based on that investigation the labor rates used were chosen as those required to provide the number of men necessary to carry out the construction program, estimated to reach about 13,000 at the peak of construction. The wages of common labor which dominate in the cost of constructing a natural gas property were taken at 45 cents per hour. Appropriately higher wages were taken for semi-skilled and skilled labor, straw bosses, working foreman, foreman, etc., all in accordance with the practices of the construction industry.

Unit costs were developed to reflect the construction conditions prevailing in the territory occupied by the Company's property as determined by an extensive field survey made for the purpose. The use of construction machinery was included wherever economical. These unit costs were developed for a considerable number of types of buildings and of classes of equipment and assemblies which were given identifying numbers. Reference to these types and

classes by number appear in the priced inventory opposite each item to which they were applied.

—16—

In the priced inventory there are no allowances for contingencies and omissions other than those included in the unit costs. The unit costs of specified items of machinery and equipment are the costs as quoted by manufacturers plus freight to average points of delivery and an allowance for miscellaneous material costs described below. The other unit costs involving labor alone or labor and material were developed from basic operations by the use of methods described below in appropriate sections covering each of the several major classes of property. The typewriting of unit cost developments has been omitted in the interest of brevity but such developments are available for examination in convenient form in the working papers.

In the unit cost developments the cost of insurance related to payrolls is included as labor cost at rates quoted by insurance agencies effective as of the inventory date. There are similarly included as labor cost, federal and state unemployment insurance taxes and federal old age benefits tax.

Included in the development of the unit costs are allowances for miscellaneous material costs and miscellaneous labor costs to reflect those costs necessarily incurred and contingencies met in the actual construction work over and above the cost of the specified items of material and hours of labor. As related to materials these miscellaneous costs arise from causes such as purchasing, expediting shipment and checking receipt of materials, and ware house activities as required, together with loss, damage and wastage of materials and other contingencies. As related to labor these miscellaneous costs arise from causes such as bad weather and other contingencies affecting performance, the

—17—

use and wastage of tools, the use of equipment, and the field office and supervisory costs. Contractors' allowances where made cover the contractor's West Virginia gross income tax, general overheads, insurance against abnormal risks and a margin of profit.

* * * * *

[Detailed explanation of determination of unit costs for various types of properties omitted.]

—29—

**11. Undistributed Construction Costs**

In addition to the costs incurred by the construction forces there are other costs relating to the project as a whole rather than to its separate parts which are as necessary as the payments for material installed and the wages of laborers.

These general or undistributed construction costs arise principally from (a) the engineering work necessary to design, supervise and inspect construction, and to test, check and turn over to the management an operative plant, (b) preliminary investigations and reports on the project, nego-

—30—

tiations with the public authorities and others with respect to permits, taxes, and other matters, expenses in connection with the receipt and disbursements of funds and accounting therefor, payment of insurance and taxes applicable to the construction period, the assembling of an operating organization and many other costs, and (c) interest on the money expended for construction of the various parts of the project until they can be put into operation.

These general costs may also include the cost of assembling the funds required for construction, but no provision for such costs is included in the reproduction cost now set forth in this exhibit.

In the 1931 *East Ohio-Cleveland* rate case before the Public Utilities Commission of Ohio these undistributed

construction costs were the subject of conferences between engineers representing the City of Cleveland, engineers of the Ohio Commission and engineers of Ford, Bacon & Davis, Inc., representing The East Ohio Gas Company. These engineers finally agreed upon the following to be added to the reproduction cost new of the priced inventory of the property of the Hope Natural Gas Company:

| | |
|---|---|
| Preliminary organization expense | 0.5% |
| Engineering and superintendence during construction | 4.5 |
| Administrative and legal expense during construction | 2.0 |
| Taxes during construction | 2.0 |
| Interest during construction | 8.0 |

The last item, of course, was to be applied to the total of the priced inventory and the other undistributed construction costs above stated. In the aggregate the allowance thus amounts to 17.72%.

A similar agreement was later entered into in the 1932 *East Ohio-Akron* rate case before the Ohio Commission.

—31—

That Commission itself used the undistributed construction costs for the Hope Natural Gas Company's property above set forth in the 1932 *East Ohio-Akron* case and the 1937 *East Ohio-Cleveland* case.

In view of the repeated use of the above allowance by engineers representing the various parties to rate controversies involving this same property and by the Ohio Commission in its findings relating thereto, the same allowances have been used here. While my own experience and the experience of Ford, Bacon & Davis, Inc. in construction work of this kind indicates that these allowances on the whole understate the full amount of undistributed construction costs that would be actually incurred upon a reproduction of this property, nevertheless I have adopted them in the aggregate as the minimum over-all allowances that are required.

**12. Cost of Developing the Property as a Going Concern.**

All of the elements of cost described above relate solely to the construction of the bare bones of the physical property or plant of the Company. They include no amounts whatsoever for the costs involved in the negotiation of gas purchase and sales contracts or for the costs of seasoning of the property and the development of an efficient operating organization. Neither do they include any of the other additional costs which arise during the period required to develop the full use of the property. In the development of a new property as a major operation all of such costs are experienced and funds must be provided from some source to meet these expenditures. Nevertheless the cost of reproducing the property of the Company set forth in this exhibit contains no allowance for the cost of establishing the property of the Company as a going concern over and above the bare cost of its construction or any other of the allowances commonly referred to as going concern value.

—32—

**13. Summaries.**

The estimated cost of reproduction new as of December 31, 1938 of the production and transmission properties of the Company, together with its general properties used jointly in the production, transmission and distribution of gas, all as described above, are set forth in detail in the priced inventories which constitute Parts B to I of this exhibit. These costs are summarized by accounts in the statement on the following pages of this Part A which shows:

## Hope Natural Gas Company
## Estimated Cost of Reproduction New as of December 31, 1938

| | |
|---|---|
| *Natural Gas Production Plant* (exclusive of leaseholds and properties used to transport coke-oven gas) | $50,167,205 |
| *Transmission Plant* (exclusive of properties used to transport coke-oven gas) | 29,131,101 |
| *General Plant (Jointly Used)* (exclusive of properties used to transport coke oven gas) | 1,379,451 |
| *Total of Above* | $80,677,757 |
| *Undistributed Construction Costs* | 14,296,099 |
| *Total Natural Gas Production Plant, Transmission Plant and General Plant (Jointly Used)* (exclusive of leaseholds, properties used to transport coke oven gas, working capital and going concern costs or value) | $94,973,856 |

## STATEMENT OF EXPERIENCE AND QUALIFICATIONS OF PETER ANTONELLI

**1. Name, address and age**

Peter Antonelli, 592 Bard Avenue, Staten Island, New York; age 47.

**2. Education**

Crane Technical College, Chicago, Illinois; Cornell University, Ithaca, New York (M.E., 1919).

**3. Present position**

Member of the staff of Ford, Bacon & Davis, Inc., 39 Broadway, New York, New York.

**4. Experience and qualifications**

Upon graduating from Cornell University, I became employed by Ford, Bacon & Davis, Inc. and have been so continuously from that time. My work for this firm has been of an engineering and investigating nature, involving the examination of all kinds of operating properties such as power and light, steam, water, oil and manufactured and natural gas. I have specialized in natural gas work of all kinds and have done a great deal of valuation work. This valuation work has involved the preparation of field inventories, inspection of properties for determination of their condition, development of unit costs, conducting research into labor performances on various construction enterprises, especially pipe lines, investigating basic material prices, analysis of direct material and labor overheads and general overheads and analyses and determinations of

—3—

the original cost of properties. I have assisted in making preliminary investigations into the possibilities of pipe line construction, made preliminary estimates and the like.

The companies for which I have done work of the foregoing nature include the following:

Amarillo Gas Company
Arkansas Natural Gas Company
Arkansas Pipe Line Corporation
Atlantic Refining Company
Carpenter Steel Company
Central Hudson Gas Company
Coffeyville Gas & Fuel Company
Columbia Gas & Electric Corporation
Commonwealth & Southern Corporation
Consolidated Gas Company
Corning Light & Power Company

Dalhart Gas Company
Dayton Power & Light Company
Dominion Tar & Chemical Company
Duquesne Light Company
East Ohio Gas Company
Empire District Electric Company
Fredonia Gas Company
Hardin Wyandot Lighting Company
Hope Natural Gas Company
Kansas City Gas Company

Logan Gas Company
New York Steam Corporation
Niagara Lockport & Ontario Power Company
Ohio Producing Company
Oklahoma Natural Gas Company
Ouachita Natural Gas Company
Paducah Water Company
Pennsylvania Electric Company
The Peoples Natural Gas Company
Potter Gas Company
Puget Sound Power & Light Company

Sinclair Consolidated Oil Company
Southern Natural Gas Company
Standard Oil Company of Indiana
Standard Plate Glass Company
Tri-State Gas Company

United Fuel Gas Company
Union Carbon & Carbide Company
Western Ohio Public Service Company
Winchester Repeating Arms Company

—5—

## WRITTEN STATEMENT OF PETER ANTONELLI

### 1. Matters Covered By This Exhibit

This exhibit sets forth the original cost of the production system, the transmission system and general properties of Hope Natural Gas Company as these properties existed at December 31, 1938, excluding those properties, both distribution and general, used solely for the distribution of gas in West Virginia. It explains the methods followed in determining this original cost. This exhibit also shows the original cost of these properties trended to 1938 prices, namely the original cost adjusted to the labor rates and material prices prevailing in 1938, and explains the methods used in determining this trended original cost.

On January 1, 1939 there became effective and applicable to the Company a new Uniform System of Accounts for Gas Utilities prescribed by the Public Service Commission of West Virginia, Exhibit No. 13 in the present proceedings. Under this new uniform system the Company was required to state its plant accounts on the basis of the original cost of the properties included therein.

In anticipation of the adoption by the West Virginia Commission of this new system of accounts, the Company in July, 1938 began the studies and investigations of its records necessary to determine accurately the original cost of its properties. It hired a special force ranging up to 40 individuals during the balance of 1938 and up to 120 in 1939 and 180 in 1940. This force, consisting of accountants, engineers, clerks, comptometer operators and others, has

—6—

been continuously engaged during all of this period in making the studies and original cost determinations sum

marized in this exhibit and has been under my personal direction and supervision since September, 1938.

The Company's accounting methods have varied from time to time during the long period of its existence. From its organization in 1898 to December 31, 1922 there was no system of accounts prescribed for the Company and it kept such books and records as it deemed necessary. During this period the Company followed various accounting methods, as accounting principles were not as fully developed as they are at present. Since the Company's natural gas business was an outgrowth of the oil business and was organized by persons connected with the oil business, it generally followed accounting methods then in use by oil companies. For example, in accordance with conservative oil company accounting methods the Company did not capitalize well construction costs.

Effective January 1, 1923 the Public Service Commission of West Virginia prescribed a uniform classification of accounts to be kept by all natural gas companies subject to its jurisdiction. This classification caused a number of major changes to be made in the Company's methods of keeping property records. A revised classification of accounts was prescribed by the West Virginia Commission, effective as of January 1, 1931, which was adopted by the Company January 1, 1932 and remained in effect until December 31, 1938. As noted above, effective January 1, 1939 the present new West Virginia system of accounts became applicable. These various uniform systems of accounts for

gas companies as prescribed by the Public Service Commission of West Virginia are in themselves not identical either in principle or in the methods of accounting permitted thereunder.

The cost of the Company's properties as capitalized on its books therefore reflects many different accounting methods and is not in accordance with the accounting principles reflected in the new 1939 West Virginia system of

accounts. However, irrespective of variations in accounting methods, the Company throughout its history by vouchers and otherwise has kept a complete and detailed record of all of its transactions. Since the Company has preserved substantially all original vouchers and all accounting books and records from the beginning of operations it was possible, by checking the vouchers and other available records pertaining to properties in existence at December 31, 1938, to determine accurately the original cost of substantially all of these properties irrespective of changes in accounting methods, and to estimate the original cost accurately of minor portions of the property where original vouchers were not available or where purchases of operating units or systems had been made from other utilities and no records of the original cost of such properties were available.

After the original cost of the Company's properties was determined this cost was adjusted by trends based on labor and material prices as shown in the Company's books to determine what the original cost would have been had the fluctuating labor rates and material prices paid by the Company in the past been the same as those paid in 1938. This adjustment corrects the original cost of the properties in existence at December 31, 1938 to reflect

changes in price levels and indicates what the original cost of these properties would have been had the general price level been constant at the 1938 level throughout the whole period of the construction of the Company's properties since 1898 on.

## 2. Inventory Of The Company's Properties As Of December 31, 1938

The first step in these determinations was to obtain an accurate inventory of the Company's properties as of December 31, 1938. To this end the following steps were taken:

(a) A transcription was made of the Company's investment ledgers detailing the various items of property owned by the Company as of December 31, 1938 as shown by its books. This transcription resulted in a complete book inventory of all of the Company's production system, transmission system and general properties (excluding its properties, both distribution and general, used solely for distribution of gas in West Virginia) except communication equipment, where the investment ledgers were not so detailed as to show the communication equipment in place at December 31, 1938. This book inventory was transcribed upon approximately 40,000 multi-column sheets.

(b) The December 31, 1938 book inventory as so transcribed was then checked, account by account, against all other available records pertaining to these properties in the Company's general office and in its field offices throughout its system. These records consisted of subsidiary property records in the Company's accounting department, records, maps and other data

pertaining to the property accounts in the Company's engineering and geological departments and in the operating departments in the field offices.

(c) This book inventory so prepared and checked against all office records was then further checked in the field. Substantially all of the visible property was verified by field observation as to its existence and description. The buried property such as pipe lines was checked in the field by a sampling method as to its existence and description. Thus the book inventory was corrected to reflect only property in existence at December 31, 1938.

In connection with the field check of compressor station structures and equipment, use was made of a

detailed inventory of the Company's properties as of June 30, 1931 which was made and agreed upon in the 1931 East Ohio-Cleveland rate case before the Public Utilities Commission of Ohio by engineers representing the City of Cleveland, engineers of the Ohio Commission and Ford, Bacon & Davis, Inc., representing The East Ohio Gas Company. This agreed 1931 inventory, adjusted to reflect all additions and retirements from June 30, 1931 to December 31, 1938 as checked in the field, was used to verify the book inventory of compressor stations and structures and to furnish more detailed descriptions and dimensions of property than appeared in the investment ledgers.

In the verification of the inventory of pipe lines new surveys were made wherever necessary to confirm the accuracy of inventory data on hand.

—10—

(d) In the course of the preparation of the inventory it was found that the transcribed investment ledgers did not give a sufficiently detailed description for the property in certain accounts. Accordingly, in the course of the field check previously described, new physical inventories were made in the field as of December 31, 1938 for field and transmission measuring and regulating station equipment, shop equipment, office furniture and equipment, other production equipment, other transmission system equipment, garage equipment, communication equipment, pumping and bailing outfits, laboratory equipment and all structures except those at compressor stations.

The inventories so prepared and verified comprise the properties existing at December 31, 1938 for which the original cost and trended original cost were determined. They likewise constitute the basis of the reproduction cost determination presented in another Company exhibit.

In cases where the preparation and verification of this inventory showed that property no longer in existence was still carried on the books of the Company all necessary adjustments were made to eliminate the charges for such property. Where property was found by the field check which had not been recorded on the books, appropriate adjustments were made to include these items. Various adjustments were made to transfer property between accounts as prescribed by the new West Virginia system of accounts in order to classify the Company's plant accounts in accordance with this new system.

Statement C at pages 33 and 34 of this exhibit shows a classification of the inventory, transfer and correcting ad-

justments made to the amounts capitalized on the Company's books as of December 31, 1938. Columns (6) to (8) of this statement show the changes resulting from the inventory adjustments and transfers between accounts as above described.

### 3. General Procedures Followed In Original Cost Determination

#### A. Property Constructed by the Company

For each unit of property shown in the inventory the Company's records were examined to determine whether such property was constructed by the Company or purchased by the Company from another party. Different methods were necessarily required for determining the original cost of these two types of property. There is first explained here the general procedures used to determine the original cost of properties constructed by the Company itself and next the general procedures as to purchased property.

In transcribing the book inventory as previously explained there was likewise transcribed from the investment ledgers the cost of each item as capitalized on the

Company's books, and the voucher number and date of each voucher. These vouchers were carefully analyzed, and where such analysis disclosed them to be closing vouchers, transfer vouchers or inventory adjustment vouchers, the original vouchers containing the original entries pertaining to the unit of property were traced and analyzed. To trace the original vouchers, use was made of all of the available data in the Company's records including investment ledgers, voucher records, general ledgers, warehouse transfers, labor and teaming vouchers, etc. The actual costs disclosed by the original vouchers were recorded in all cases where the investment ledgers did not correctly set forth these costs.

—12—

In the analysis of the actual cost of items constructed by the Company it was ascertained that particularly prior to 1923 some costs were charged to expense. For example, prior to 1923 all the costs of drilling the Company's wells were charged to expense. Accordingly the voucher analysis referred to above included an analysis of all operating expense vouchers pertaining to construction and improvement costs which had been charged to expense. All actual material and labor costs of property in existence at December 31, 1938 which had previously been charged to expense were recorded on the final original cost sheets.

Statement D at pages 35 and 36 of this exhibit sets forth an analysis and summary of these direct costs not heretofore capitalized by the Company.

The analysis of vouchers and records showed that Company expenditures for field supervision, field clerical work, warehouse handling, and other field costs in connection with equipment and plant construction had in many cases not been included in costs as capitalized by the Company on its books but had been charged to operating expenses. In order to determine the original cost of the Company's properties such field costs, termed "unloading, hauling and

warehouse handling costs" and "indirect field costs," had to be ascertained from an analysis of the Company's records covering the costs experienced in the performance of these construction activities. Unloading, hauling and warehouse handling costs and indirect field costs were ascertained and recorded on the final original cost sheets for the property in the following accounts:

—13—

Acct. 332-1—Producing Gas Wells—Well Construction
Acct. 332-2—Producing Gas Wells—Well Equipment
Acct. 333-1—Field Lines:
Construction
Equipment
Acct. 333-2—Field Measuring and Regulating Station Equipment
Acct. 354-3—Transmission System Measuring and Regulating Equipment

Statement E at pages 37 to 40 of this exhibit explains the methods followed in determining these costs.

The analysis of the vouchers and records also showed that in most cases the Company's expenditures for general administrative supervision, engineering, accounting, purchasing, payroll and other like services in connection with the equipment and the plant construction had not been included in the costs capitalized by the Company but had been charged to operating expenses. To determine the original cost of the Company's properties in accordance with the accounting principles set out in the new West Virginia system of accounts it was therefore necessary to determine the amount of these expenditures incurred in connection with the construction and acquisition of the properties in existence at December 31, 1938. These expenditures, termed "overhead costs," were grouped as follows:

1. Purchasing department, including the traffic and invoice departments.
2. Payroll department.

3. Land department, including the leasing department.
4. General overhead, consisting of administrative, legal, accounting and engineering services.
5. Interest during construction.

A detailed study was made by calendar years from the inception of the Company until the end of 1928 to determine

what portion of the Company's expenditures for these departments and services should be charged to investment so that the original cost of the existing plant might be properly shown.

This study showed the proper percentages for these overheads to be added to the direct material and labor original costs. These percentages were accordingly applied on the final original cost sheets to direct material and labor original costs there shown where such overhead costs had not previously been included in the capital accounts. Interest during construction could not be obtained from an analysis of the Company's overhead expenditures since the Company has never included any charge for interest during construction in its plant accounts or in its operating expenses. Interest during construction was therefore applied at the rate of 6% per annum to construction projects requiring more than thirty days to build and costing more than $5,000.

Statement F at pages 41 to 52 sets forth first a description of the methods used in determining these overhead percentages and second a table summarizing them by years. The amounts of the various kinds of overhead costs and the total of these costs included in the original cost are shown in Statement G at pages 53 and 54 of this exhibit.

In general the original cost sheets covering property constructed by the Company therefore show for each item of property:

1. The cost at which capitalized on the Company's books.

2. Adjustments required by reason of corrections of the book inventory, transfers of property as between accounts and corrections to eliminate inaccuracies where the cost as capitalized on the Company's books was based on transfer or inventory adjustment vouchers.

—15—

3. The costs of the property not capitalized by the Company consisting of:
   (a) Direct labor and material costs,
   (b) Unloading, hauling and warehouse handling costs,
   (c) Indirect field costs,
   (d) Overhead costs.
4. The total original cost of each inventoried item of property in existence at December 31, 1938.

**B. Property Purchased by the Company**

(1) *Purchased from non-utilities, or from other utilities where not an operating unit or system*

Where the analysis of the Company's records showed units of property in existence at December 31, 1938 which had been purchased from non-utility corporations or individuals, or from a public utility in cases where the item was not an operating unit or system, the original cost was recorded on the original cost sheets at the cost of acquisition to the Company, plus general overhead to cover administrative, legal, accounting and engineering services in connection with these purchases in the amount of one-fourth of the general overhead percentage determined for properties constructed by the Company. As in the case of properties constructed by the Company all pertinent vouchers and other records were carefully analyzed in order to record correctly the cost of acquisition on the original cost sheets.

(2) *Purchased from other utilities as an operating unit or system*

Where the analysis of the Company's records disclosed that property in existence at December 31, 1938 had been purchased as an operating unit or system from a public utility, the original cost of such property was determined

—16—

by an analysis of all the pertinent records and data that could be obtained. The amount of such property is small, comprising less than 7% of the total.

Certain of these public utilities such as Flaggy Meadow Gas Company, Mountain State Gas Company, Clarksburg Light and Heat Company and Reserve Gas Company were either affiliated with the Company or were purchased in their entirety. All of the existing books and records of these companies were available for examination and analysis. In such cases these records were analyzed and the original cost determined precisely as was done in the case of the Company's books and records for property constructed by the Company. As to other utility corporations such as Fayette County Gas Company and United Fuel Gas Company, the original cost of the properties in question was furnished by these companies at the request of the Hope Company. This data was fairly complete, but did not include overheads. All other companies from which original cost data was requested advised that they were unable to furnish the original cost of the properties purchased from them by the Hope Company. In such cases, involving minor amounts of property, the original cost was based on the Hope Company's experience in constructing similar properties under similar circumstances and during like periods.

Inasmuch as none of the original cost data obtained by inquiry from other utility corporations included overhead expenditures, the overhead percentages developed from the analysis of the Company's experience as described

above were applied. The studies made indicated that such an application resulted in a conservative estimate of the overhead expenditures actually incurred in the construction of these purchased properties.

—17—

The original cost sheets listing purchased property contain references to vouchers of the predecessor company where available or to other sources of information used in the original cost determinations. The last column on each of these sheets shows the total original cost of all purchased properties determined on the basis here described.

**4. Application Of General Original Cost Procedures To Major Classifications of Property**

The general original cost procedures heretofore described were applied, account by account, to the properties in each plant account. This application may be briefly described by major classifications of property as follows:

*Land.* The original cost of each parcel of land was based on the deeds and original vouchers pertaining thereto. This cost includes the consideration paid, the cost of obtaining the deed, recording, abstracting and miscellaneous costs and land department and general overhead expenditures.

*Natural gas leaseholds.* The leasehold accounts include all the natural gas leaseholds, natural gas rights and royalties which the Company owned as of December 31, 1938, both those classified by the Company as operated and those classified as unoperated.

In determining the original cost of these leaseholds and rights the consideration paid by the Hope Company for the first lease taken or acquired by the Hope Company on each tract under lease at December 31, 1938 was ascertained and recorded on the original cost sheets. No distinction was drawn as to whether the lease was taken or ac-

quired from a farmer, individual or private company or another utility. There was likewise included the cost of

—18—

obtaining, recording and abstracting these first leases and gas rights and land department and general overhead expenditures.

The consideration paid by the Company was obtained from vouchers listed in the lease ledgers. The cost of obtaining leases acquired directly from land owners was secured from lease vouchers during the period 1921 to 1938 inclusive. Prior to 1921 such costs were estimated, where necessary, based on an analysis of the known cost of obtaining over 3,700 leases. Costs of recording and abstracting leaseholds were secured in most cases directly from the Company's records. Where estimates were necessary they were based on a summary of recording and abstracting costs contained in vouchers, statements and other records of the Company.

This original cost is the nominal acquisition cost of the particular tracts under lease at December 31, 1938 and does not reflect the substantial original exploration costs by way of delay rentals, dry hole expense and losses on cancelled leases incurred by the Company in exploring for, locating and developing these tracts.

*Rights of way.* The original cost of rights of way includes the consideration and advance damages paid, expenses incurred in obtaining and fees paid for recording and land department and general overhead expenditures. The original cost was obtained by an analysis of vouchers, original grants, inventory ledgers, and rights of way record books. In determining these costs the right of way over each farm or land tract was considered as a unit of property. Inventory adjustments were made on this basis where rights of way were not retired by the Company when a line was lifted.

—19—

*Gas Wells.* The original cost of gas well equipment was generally determined from the Company's well investment ledgers. Since its inception the Company has recorded by individually numbered wells a description of the equipment in each well, also the size, quantity and cost, together with the voucher numbers and dates. Vouchers were checked wherever necessary. Warehousing, purchasing and general overhead expenditures and interest during construction where applicable were included.

Prior to 1923 well construction costs were not capitalized by the Company but were charged to expense. Accordingly well construction costs prior to 1923 were determined from an analysis of the original vouchers and well records. Beginning in 1923 well construction costs were generally capitalized and recorded in the well investment ledgers. These ledgers were used in determining the original cost of well construction from January 1, 1923 on, checked as necessary against vouchers. Indirect field costs, payroll, purchasing and general overhead expenditures and interest during construction where applicable were included in well construction.

The original cost of wells drilled by the Company or for the Company by a contractor when the Company furnished the rig reflects the average cost of drilling rigs, after elimination of recorded arbitrary charges for use of derricks, bull wheels, sand reels, etc.

*Pipe lines.* For lines built or acquired subsequent to 1919 the investment ledgers in most cases reflected the actual direct material and construction costs. All ledger entries of any appreciable amount for such lines were

—20—

checked against the original vouchers for accuracy. Prior to 1920 the Company's investment ledgers did not segregate the cost of pipe lines by individual lines. The original cost of lines laid prior to 1920 and still in existence at De-

cember 31; 1938 was therefore determined from the original vouchers, the 1920 inventory voucher allocating total pipe line costs to individual lines being disregarded in this connection as not truly reflecting correct original cost. Original vouchers were found for all lines except for a few small field lines laid prior to 1907 where the original cost had to be estimated. These estimates were based on the known costs of lines laid by the Company at approximately the same period and in the same territory.

The original cost of pipe lines includes direct labor costs not included in the cost capitalized on the Company's books, indirect field and warehousing costs and overhead expenditures as described above, except that in the case of main and trunk lines indirect field costs and warehousing costs were not included. In the case of main and trunk lines indirect field costs were generally included among the direct construction costs as shown by the vouchers, and as a general rule warehousing costs were not incurred in the construction of these lines as the material was unloaded at the point of construction.

*Compressor station structures and equipment.* The original cost of the equipment in the Company's compressor stations was obtained from the investment ledgers, verified and corrected on the basis of the vouchers and invoices. These ledgers did not segregate the installation costs of

equipment erected prior to 1920 from the construction costs of the compressor station structures. It was likewise found that prior to 1920 no attempt was made to show on the Company's books the cost of individual compressor station buildings, nor was any record made of the number and size of the principal compressor station buildings erected during any construction period. Charges were shown for each compressor station as a whole. After 1920 the costs of the principal buildings at each compressor station were set up separately but in many instances materials were not

accurately charged and the costs of smaller buildings and miscellaneous items such as concrete walks, curbs, equipment foundations, etc. were absorbed in the major structures.

In view of these circumstances a special study was made of all vouchers, records and other available data pertaining to compressor station structures and equipment. In this analysis all major investment ledger entries were verified by an examination of the vouchers. The materials as enumerated in the purchase vouchers were summarized and the total quantities purchased were compared with the total materials reasonably necessary for the construction of the buildings at each station as shown in the agreed 1931 inventory (adjusted to date) previously referred to. In many instances local conditions which might affect the quantity of materials required were checked in the field by conferring with men who were in charge, or who worked on the various jobs. Upon completion of this study, the actual cost of the various materials such as sand, gravel, cement, lumber, etc. was prorated over the buildings comprising each compressor station, using as a basis the quantities contained in the agreed inventory. The costs of

labor, teaming, freight and engineering and supervision were then allocated to the buildings in like manner, subject to the necessary variations which local conditions or engineering judgment might require. The various material and labor costs thus derived were then summarized for each structure in the inventory. This summary also gives the date of construction of each structure, and information as to whether the work was performed by Company forces or by a contractor.

This analysis showed that a number of the structures existing at December 31, 1938 were not included in the Company's capital accounts. Where the cost of these structures was shown in the expense vouchers it was recorded on

the original cost sheets. In a few cases in the absence of actual cost records, the original cost of structures was estimated on the basis of material prices and labor rates for the years involved as paid by the Company and obtained from a study of compressor station voucher records and payroll accounts from 1903 to 1938.

Included in the original cost of compressor station structures and equipment are direct material and labor costs not capitalized on the Company's books, purchasing, payroll and general overhead expenditures and interest during construction where applicable.

*Other structures.* For structures other than compressor station structures as included in the various structure accounts the Company's investment ledgers and vouchers were analyzed and all determinable actual costs were recorded on the original cost sheets. A special analysis was made to determine whether the material and labor costs as so found were consistent with the materials necessary for the structures as determinable from the new field inventories of these structures. In a few cases where partial

or complete costs of a structure had not been capitalized and could not be identified in expense vouchers, the omitted costs were estimated, based on known costs of similar structures, and these estimated costs were recorded on the original cost sheets as costs which had been charged to expense. In other respects the original costs of these various structures were completed in the same way as the original costs of the compressor station structures.

*Miscellaneous and general equipment.* The new field inventories made in connection with the original cost inventory as previously described included new inventories for the items contained in the miscellaneous and general equipment accounts. The vouchers for the major portion of the equipment listed in these new inventories were ex-

amined and the costs as set forth in these vouchers were recorded on the original cost sheets. This equipment included measuring and regulating equipment, shop equipment, office furniture and equipment, other production and other transmission system equipment, garage equipment, communication equipment, pumping and bailing outfits and laboratory equipment. For the items that could not be identified by voucher the Company's purchasing department records and vouchers showing the cost of similar items were used and in a few cases for certain items the original cost was determined by trending known costs.

Installation costs of communication equipment were based upon the costs of installing Company telephone lines and equipment for which the actual installation costs were determinable from the Company's records.

In completing the original cost determination for these accounts purchasing, payroll and general overhead expenditures were included where applicable.

—24—

**5. Details Of The Original Cost Determination**

The details of this original cost determination are recorded on approximately 78,000 multi-column sheets. The final original cost sheets set forth specifically the inventory as of December 31, 1938, the original cost of each inventoried item, whether heretofore capitalized or not capitalized by the Company, and the voucher and other references showing specifically the source of the original cost determination. These detailed sheets are available at the Company's general office for analysis and check by all parties to the present proceeding and have been examined by members of the staff of the Federal Power Commission commencing in January, 1940. In the interest of economy and brevity these 78,000 sheets are not here reproduced.

## 6. General Procedures Followed In Trending The Original Cost To 1938 Prices.

In trending the original cost of the Company's properties existing at December 31, 1938 to reflect the 1938 price level it was necessary to develop numerous basic trends. As to the larger part in value of the Company's properties these trends were based on labor and material prices shown on its books and records.

In certain instances it was necessary to develop trends in part by reference to general price data accumulated by other natural gas companies, by Ford, Bacon & Davis, Inc. and by certain statistical services, but in every such case the data used in arriving at the trends were for the kinds of labor and material entering into the type of construction constituting natural gas properties such as these of the Hope Company.

—25—

The original costs of the land, rights of way and leasehold accounts and a few minor accounts such as laboratory equipment, drilling and cleaning tools and automobiles were not trended. The original costs of properties in all other accounts were trended by the use of yearly trend factors with 1938 costs as 100. These factors for each account were obtained from trends of the particular labor and materials included in the properties in each account. In some instances composite factors were used, determined by trending representative items of property in each account.

The year by year trend factor so determined for each account was applied to the original cost incurred in each year for the property in that account which was still in existence at December 31, 1938. The resulting figures fairly show what would have been the original cost of the Company's present properties if these had been constructed over the years at the 1938 labor and material prices.

Statement H at pages 55 to 62 of this exhibit sets forth a description of the determination of these yearly trend factors. Statement I at pages 63 to 96 shows for each account the original cost of the properties in the account as existing at December 31, 1938, segregated by years first placed in public service, the trend factor for each year and the total original cost trended to 1938 prices. Statement J at pages 97 and 98 summarizes by years and for all of the Company's properties here involved the data shown in Statement I for each account.

—26—

**7. Details Of Trended Original Cost Determination**

The details of the trending of the original cost of the Company's property to reflect 1938 labor rates and material prices are available at the general office of the Company for inspection by all parties to these proceedings. In the interest of economy and brevity they are not reproduced here.

**8. Summaries Of Original Cost And Original Cost Trended To 1938 Prices**

Statement A at pages 29 and 30 of this exhibit shows for each plant account the original cost and the original cost trended to 1938 prices of the natural gas production plant, transmission plant and general plant of the Company existing at December 31, 1938, excluding those properties, both distribution and general, used solely for distribution of gas in West Virginia.

At the end of Statement A there are deducted both the original and trended original costs of the Company's properties in these plant accounts which are used to transport coke oven gas. It will be noted from Statement A that the total original cost of the properties in these plant accounts of the Company, excluding the property used to transport coke oven gas, amounts to $69,735,637.86 and that this original cost trended to 1938 prices totals $105,101,912.

Statement B at pages 31 and 32 of this exhibit classifies the original cost of the Company's property, account by account, as between (1) properties constructed by the Company, purchased from non-utilities or from other utilities where not operating units or systems and (2) properties purchased by the Company from other utilities as

—27—

operating units or systems. It will be observed from Statement B that the original cost of properties constructed by the Company, etc., excluding property used to transport coke oven gas, amounts to $64,917,509.13 and that the original cost of properties purchased by the Company from other utilities as operating units or systems totals $4,818,128.73.

Statement B likewise shows for properties constructed by the Company, etc. the amount heretofore capitalized on the Company's books, the total inventory, transfer and correcting adjustments made in the course of the original cost determination, the amount of direct material and labor costs expensed, the amount of warehousing costs, the amount of indirect field costs and the total overhead expenditures incurred in connection with the construction and acquisition of these properties. As to properties acquired as operating units or systems from other utilities, Statement B shows the cost as heretofore capitalized on the books of the Company, the direct material and labor original cost of these properties and the warehousing, indirect field and overhead costs which have been added to complete the original cost of these properties. It will be noted that the costs heretofore capitalized on the Company's books for these utility properties purchased amount to $3,218,399.28 as against the original cost of these properties of $4,818,128.73.

Signed at Clarksburg, West Virginia, this May 14, 1940.

Peter Antonelli

Statement H

## HOPE NATURAL GAS COMPANY

### Determination Of Trends Used To Ascertain Original Cost Trended To 1938 Prices

**1. Basic Trends**

To trend the original cost of the Company's properties to reflect 1938 material and labor prices certain basic trends hereinafter described were determined from the Company's records, supplemented where necessary from other labor and material price data. In applying these basic trends to the Company's various property accounts they were appropriately combined, when necessary, into composite trends to reflect the proportionate cost of labor and kinds of material in each account. All such composite trends were determined and applied on the basis of a careful study of the properties in each account and the full details appear in subsidiary trended original cost sheets.

The determination of the basic trends used is here briefly described, the details of this determination likewise appearing in subsidiary trended original cost sheets.

**2. Labor Trends**

Labor trends for pipe line and gas well construction from 1906 to 1938 were based on average Company rates paid to various classifications of labor. Prior to 1906, Company rates were available only for common labor and these rates were used as the basis for determining rates and trends for other classifications as explained below.

—56—

Average Company rates were determined from an analysis of payroll vouchers for the months of April, July and October and of payroll department records for each

year from 1906 to 1938. From these data, an adopted average daily rate was obtained which in turn was converted to an average hourly rate based on the schedule of working hours in effect in each year.

Individual trends were thus ascertained for the years 1906 to 1938 inclusive, for the following principal classifications of labor used for pipe line and gas well construction:

Driller
Tool Dresser
Roustabout
Laborer

(a) These individual trends for driller and for tool dresser were combined in the ratio of one to one to determine the composite trend for gas well construction. This ratio was based on the Company's experience in drilling operations.

(b) These individual trends for roustabout and for laborers were combined in the ratio of one to four to determine the composite trend for pipe line construction, the proportion being estimated from the typical Company gang setup in laying lines.

While comparable data was not available prior to 1906, payroll vouchers for certain transmission and field lines constructed by the Company and predecessor companies provided rates paid to common labor. From the prevailing rate in each year, a trend was determined for common labor from 1891 (when some purchased property now owned by the Company was built) to 1906 and this trend was used as the basis for determining rates and trends for other classifications of labor prior to 1906.

—57—

(c) In order to ascertain trends for building construction and equipment installation, field payroll vouchers for compressor station construction were examined for each year from 1901 to 1938 to obtain average rates paid by the

Company to the classes of labor in this type of work. Average hourly rates were thus determined for the following classifications of labor:

Carpenter
Electrician
Machinist
Laborer

Since more complete data was available on the rates paid to carpenters, the trend for this classification, after comparison with other skilled labor trends (electrician and machinist), was used as typical of skilled labor. This trend was then combined with the trend for unskilled labor (laborer) in the ratio of 2 to 3, respectively, to determine the composite trend used for all structures and equipment installations except measuring and regulator station equipment and telephone equipment, the proportion of skilled and unskilled labor being determined from an analysis of MacFarlan Compressor Station construction costs.

(d) The trends for the installation of field measuring and regulator station equipment were determined from unit cost developments, based on field estimates of the time required for various classifications of labor (foreman, utility man and roustabout) and team or truck, priced at average Company rates from payroll vouchers and payroll department records as noted above. The trends so determined for field stations were also used for the corresponding type of transmission stations.

—58—

(e) Separate labor trends were not determined for the installation of telephone equipment, composite trends including both material and labor being used, the details of which appear in subsidiary trended original cost sheets.

(f) The trend for contract labor, used for the Clarksburg Office and Garage-Shop Building, was based on the index of union hourly wage rates for all building trades.

determined by the Industrial Relations Division, U. S. Department of Labor, Bureau of Labor Statistics, as published in the Engineering News Record of April 27, 1939.

### 3. Pipe Trends

The trend for steel line pipe from 1902 to 1938 was based on the weighted average trend for two, three, four, six and eight inch steel screw line pipe as determined primarily from the average delivered prices paid by the Company. In some instances, it was necessary to supplement these prices with the corresponding prices paid by affiliated companies served by the Purchasing Department of The Peoples Natural Gas Company. In a few cases, estimated prices were used, based on the available average Company prices, adjusted by the use of the steel line pipe trend developed from the average delivered prices paid by The Peoples Natural Gas Company.

Prior to 1902, the Company's price data was insufficient in detail to establish a trend. Pipe price data for wrought iron pipe up to 1899 and for steel pipe from 1900 to 1902, taken from Ford, Bacon & Davis, Inc. cost files, was used to establish a trend which was equalized to the

Company trend in 1904 and used as the basis for extending the Company price trend to earlier years.

The manufacture of steel pipe on a commercial basis began in 1900 and for this reason this year was adopted as the dividing point between steel and wrought iron pipe. The line pipe trend for the whole period to 1938 was expressed in terms of the price of steel pipe in 1938 so that the cost of all wrought iron pipe included in the original cost is thus converted to the equivalent cost of steel pipe in 1938, rather than the higher priced wrought iron.

**4. Casing and Tubing Trends**

The trend for casing and tubing from 1902 to 1938 was based on the weighted average trend for two and three inch tubing and 6⅝, 8¼ and 10 inch casing as determined primarily from the average delivered prices paid by the Company. Where prices were not available from Company records, supplementary prices were obtained as described above for line pipe.

The casing and tubing trend was extended back from 1902 on the basis of the line pipe trend explained above. As with line pipe, the trend for the entire period to 1938 was expressed in terms of the price of steel casing and tubing in 1938 and applied to the cost of all casing and tubing included in the original cost.

**5. Fitting Trends**

Separate trends were determined, based primarily on prices paid by the Company, for the following types of fittings:

—60—

Bull Plugs
Casing Heads
Dresser Couplings
Check Valves, brass (same as globe valves)
Globe Valves, brass
Nipples (same as line pipe)
Orifice Flanges
Orifice Plates
Regulators
Saddles
Stop Cocks, brass
Swedge Nipples

The Company's records of prices paid for other types of fittings do not sufficiently identify the particular kind and character of fitting or provide enough data in consecutive years with which to ascertain a trend. Consequently, price data obtained from Ford, Bacon & Davis, Inc. cost

files based on manufacturers' quotations were used to determine trends for the following:

Check Valves, iron
Fittings, screwed
Fittings, flanged
Gate Valves, screwed
Gate Valves, flanged
Gauges
Globe Valves, iron
Stop Cocks, iron

Company price records were available in most instances back to 1901 or some later year. To extend the price trends to prior years trends for corresponding types of fittings based on Ford, Bacon & Davis, Inc. cost data similar to that noted above were used.

**6. Equipment Trends**

Separate trends were determined for more than 25 different items of equipment such as gas compressors, gas engines, pumps, motors, generators, etc. More details than were obtainable from the Company's records were required to establish trends for these various items of equipment

and accordingly specific data available from Ford, Bacon & Davis, Inc. cost files was used as the primary basis for developing these trends from 1914 to 1938. In some cases specific data was available for as early as 1900. Where specific data could not be obtained to extend these trends prior to 1914 various appropriate bases were used depending on the type of equipment. For example, trends for gas compressors, gas engines, pumps, etc. were extended to earlier years on the basis of the trend for foundry iron, determined from the yearly average net cost per ton; the trends for electric motors, generators, etc. were extended back to 1900 on the basis of the trend for electric motors obtained from General Electric Company data as published

in the Building Committee Report of the New York-Pittsburgh Association of Valuation Engineers.

The bases described above were used for determining trends for all equipment except that included in the telephone account, the trends for which were based on the prices paid by the Company for the wire, poles, insulators, telephones, etc. included in the telephone installation. The methods of determining these trends are explained in the subsidiary trended original cost sheets.

### 7. Building Material Trends

Trends from 1901 to 1938 for the principal items of building material were based on average prices paid by the Company obtained from analysis of construction work performed by the Company. Trends were developed on this basis for the following materials:

—62—

Cement
Sand
Gravel
Corrugated Iron
Flat Sheet Iron

The Company records of prices paid for other building materials do not sufficiently identify the particular kind of material or provide enough data in consecutive years with which to determine a trend. The Building Committee Report of the New York-Pittsburgh Association of Valuation Engineers was used as the main source of price data for these materials for the period from 1901 to 1930, the trends so developed for approximately 50 different items being extended to 1938 by referring to prices published in the Engineering News Record and in bulletins of the United States Bureau of Labor Statistics, supplemented by data from the Ford, Bacon & Davis, Inc. cost files.

## WRITTEN STATEMENT

The Federal Power Commission, under date of October 14, 1938, issued an order of investigation into and concerning all rates, charges, classifications, rules, regulations, practices or contracts of Hope Natural Gas Company. In accordance therewith, an examination of the accounts and records of Hope Natural Gas Company has been made, and, as a result, this report on the original cost of the Gas Plant of the Company is submitted.

This report is in two parts. Volume I sets forth the investment of Hope Natural Gas Company in Gas Plant per Company books and as adjusted, as of December 31, 1938. The adjusted figures show the original cost as defined in the Federal Power Commission's Uniform System of Accounts for Natural Gas Companies of the gas plant. Volume II contains a detailed explanation of the staff adjustments.

On January 1, 1939, there became effective and applicable to the Company a new Uniform System of Accounts for Gas Utilities prescribed by the Public Service Commission of West Virginia. In July, 1938, the Company began an investigation and study of its records for the purpose of stating in its Gas Plant Accounts the cost of its properties and to reflect the amount of such cost in each primary account as prescribed by said Commission.

The results of this investigation and study made by

—2—

the Company, were made available to the accountants of the Federal Power Commission during May, 1940. An inventory of the existing property at December 31, 1938, was made by the Company and priced at what the Company claims was original cost. The results of this inventory, among other things, necessitated numerous reclassifications of costs, adjustment of prior distribution of certain costs and correction of certain accounting errors, all of which

have been examined by the Commission's staff of accountants.

There is presented immediately hereinafter a condensed balance sheet of the Company as reflected by the books of account at December 31, 1938, before any adjustments, in order to set forth the capitalized cost of Gas Plant per books on that date:

—3—

| *Assets* | *Amount* |
|---|---|
| Gas Plant: | |
| Gas Plant in Service | $56,101,875.49 |
| Construction Work in Progress | 81,392.75 |
| Gas Plant Adjustment | 94,814.75 |
| Coal Property | 341,529.68 |
| Franchises, Patent Rights and Other Intangibles | 30,185.91 |
| Total Gas Plant | $56,649,798.58 |
| Investment and Fund Accounts | 3,796,362.25 |
| Current and Accrued Assets | 15,460,687.85 |
| Deferred Debits | 5,002.28 |
| Total Assets and Other Debits | $75,911,850.96 |
| *Liabilities* | |
| Capital Stock | $27,969,300.00 |
| Current and Accrued Liabilities | 1,971,351.32 |
| Deferred Credits | 3,167.89 |
| Contributions in Aid of Construction | 540.87 |
| Reserves: | |
| Depreciation and Depletion—Utility Plant | 40,759,450.48 |
| Other | 13,932.63 |
| Surplus—Earned | 5,194,107.77 |
| Total Liabilities and Other Credits | $75,911,850.96 |

—4—

As shown on the preceding balance sheet, the Capitalized Cost of Gas Plant as of December 31, 1938, was $56,649,798.58, of which $56,101,875.49 represented Gas Plant in Service, summarized by functions as follows:

| | |
|---|---|
| Production Plant | $26,460,050.10 |
| Transmission Plant | 25,253,484.00 |
| Distribution Plant | 2,795,083.04 |
| General Plant | 1,593,258.35 |
| Total | $56,101,875.49 |

This report deals with the cost of the production plant, transmission plant, and general plant, although a cursory examination was made of the distribution plant. The following summary sets forth the cost per Company books, reclassified by the Company as shown by Schedule I, Page .... of this report, and as adjusted by the examiners:

| *Particulars* | *Cost Per Book* | *Examiners' Adjustments* | *As Adjusted* |
|---|---|---|---|
| Production Plant | $26,718,065.06 | ($ 384,673.83) | $26,333,391.23 |
| Transmission Plant | 25,279,965.69 | ( 1,414,567.34) | 23,865,398.35 |
| General Plant | 1,308,761.70 | ( 299,930.64) | 1,008,831.06 |
| Total | $53,306,792.45 | ($2,099,171.81) | $51,207,620.64 |

Schedule I of this report sets forth the total cost of Gas Plant in Service per Company books, Company's reclassification adjustments, Examiners' (F.P.C. staff) adjustments and the resulting adjusted balances, representing original cost as defined in the Commission's System of Accounts.

This schedule has been constructed to show separately the total cost of the production plant, transmission plant and general plant, representing the cost dealt with in this

—5—

report. The total cost per books, in this respect, of $53,306,792.45, corresponds with that shown by Exhibit 20, page 32, column 4.

Attention is called to the total examiners' adjustments of $2,099,171.81, representing a credit to the total capitalized cost of Gas Plant in Service, exclusive of distribution plant. This amount represents the net adjustment made by the examiners and is arrived at by the difference between credit adjustments, amounting to $5,883,085.12 and debit adjustments of $3,783,913.31, and is summarized by classes as follows:

| *Description* | *Amount* |
|---|---|
| Company adjustments per Exhibit 20 | $(1,804,383.48) |
| Company adjustments—Prior Utility Acquisitions | ( 232,930.69) |
| Correction of accounting errors | 1,480,227.70 |
| Transfers to accounts other than Gas Plant in Service | (1,542,085.34) |
| Examiners' adjustment—Net Credit | $(2,099,171.81) |

Schedule 1-A sets forth all adjustments by sources, showing contra accounts involved. It also identifies the adjusting journal entries which are given in Volume II.

The total original cost of Gas Plant in Service, exclusive of distribution plant, at December 31, 1938, is summarized in the following tabulation which shows separately acquisitions of properties classed as operating units or systems.

| | | |
|---|---|---|
| Company constructed and purchases from non-utilities: | | |
| Cost per Books | $50,088,393.17 | |
| Adjustments | (1,866,241.12) | |
| As adjusted | | $48,222,152.05 |
| —6— | | |
| Acquisitions of Prior Utilities: | | |
| Cost per books | $3,218,399.28 | |
| Adjustments | (232,930.69) | |
| As adjusted | | $ 2,985,468.59 |
| Total as adjusted—Dec. 31, 1938 | | $51,207,620.64 |

The above tabulation has been made, to focus attention on properties acquired from prior utilities. As shown above and also by Exhibit 20, page 32, column 12, the cost capitalized per Company books for this class of acquisitions is $3,218,399.28. By repricing these same properties, the Company arrives at a cost of $4,639,010.78, as shown by Exhibit 20, page 32, column 13. This repricing would result in an increase in cost recorded in plant accounts of $1,420,611.50. The Company adjustments or repricing are not concurred in. The only adjustments to this class of property approved by the examiners are shown in the above tabulation ($232,930.69). They represent Company adjustments to reclassify capitalized cost and correct accounting errors.

An analysis of approximately ninety percent of such acquisitions and a careful examination of all vouchers, books and data available, together with consideration of each individual acquisition, leads to the conclusion there is no justification for any adjustments whereby the amounts now recorded in plant accounts would be increased. It is the opinion of the examiners that the amounts recorded at the time of acquisition represent the original cost as near as can be determined.

—7—

The total proposed adjustment to this class of property, developed by the original cost study made by the Company, included a credit of $967,151.87, classified as follows:

| | |
|---|---|
| Credit plant accounts—Accrued Depreciation | $(746,851.51) |
| Estimated costs of obtaining | 10,917.50 |
| Estimated costs of construction | 1,712.83 |
| Correction of accounting errors | (232,930.69) |
| Total | $(967,151.87) |

Of the above proposed adjustments, the examiners have approved only the correction of accounting errors representing a credit to Capitalized Cost of $232,930.69.

Schedules 2 to 33, inclusive, set forth the investment in gas plant, exclusive of distribution plant, by accounts, showing the cost per books, staff adjustments, and the adjusted or original cost balances. These schedules are the result of a detailed examination made by the Commission's staff of accountants of the books, records, and documents of the Company, including the Company's Original Cost study. The adjustments include the reclassification of items shown in Schedule 1.

Schedule No. 34 is a summary of amounts transferred to Account 100.4, Gas Plant Held for Future Use, of the Commission's Uniform System of Accounts.

Schedule No. 35 is a statement of Account 107, Gas Plant Adjustments, showing the source of data and manner of determining amounts by the Company.

Schedule No. 36 is a statement of Investment in Coal Property. This investment was included in Gas Plant as of December 31, 1938 by the Company, although not in-

cluded as a part of the original cost claimed per Exhibit 20. No adjusting entry has been proposed by the Company to transfer this cost to other accounts. This item has been eliminated from Gas Plant by the examiners and transferred to Account 110, Other Physical Property, by Balance Sheet Journal Entry No. 100.

Schedule No. 37 is a summary of an account designated by the Company as "Franchises, Patent Rights and Other Intangibles" and was included in Gas Plant as of December 31, 1938. An analysis of this account discloses that it consists of three items as follows:

*Patent Rights:*

| | |
|---|---|
| Thermo-syphon system for gasoline absorption plant | $ 458.66 |
| *Contracts and Franchises:* | |
| Acquired in acquisition of Clarksburg Light and Heat Co. | 5,811.64 |
| *Contract for Gas:* | |
| Hamilton Gas Corporation | 23,915.61 |
| Total | $30,185.91 |

The first two items shown above have been eliminated from Gas Plant by the Examiners and charged to Surplus by Balance Sheet Journal Entry No. 101.

The third item has also been eliminated from Gas Plant and transferred to Account 146, Other Deferred Debits, by Balance Sheet Journal Entry No. 101.

—9—

Volume II of this report, as stated hereinbefore, deals with adjustments made by the examiners and includes a summary of all adjustments, together with adjusting journal entries and a detailed explanation of each.

JOHN W. PACE,
*Senior Examiner of Accounts.*

EDWARD L. DUNN,
*Examiner in Charge of Field Assignment.*

## 9. TESTIMONY OF COMMISSION WITNESS CHARLES W. SMITH AS TO PRINCIPLES OF ACCOUNTING, TUESDAY, APRIL 22, 1941, RECORD PAGES 2702 TO 2823.

—2702—

Whereupon, CHARLES W. SMITH, a witness called on behalf of the Commission, having first been duly sworn, was examined and testified as follows:

DIRECT EXAMINATION by Mr. Springer.

Q. Will you state your full name and position, please? A. Charles W. Smith, I am chief of the Bureau of Accounts, Finance and Rates, of the Federal Power Commission.

Q. Will you please state your qualifications? A. I have a B. S. degree in finance and business administration, and, also, an L.L.B. degree. I am a certified public accountant of North Carolina and of Maryland, the first having been obtained about eighteen years ago. I am a past president of the Maryland Association of Certified Public Accountants and a member of the American Institute of Accountants, the American Accounting Association, the American Economic Association, the American Bar Association, and an honorary member of Delta Sigma Pi, an international commerce fraternity, and Beta Alpha Psi, a national accounting fraternity. I am also a member of the Committee on Statistics and Accounts and the Committee on Depreciation of the National Association of Railroad and Utilities Commissioners. I have been admitted to bar of the Court of Appeals of Maryland and the Supreme Court of the United States.

—2703—

For nine years, beginning in 1920, I was an auditor in the Income Tax Unit of the U. S. Treasury Department and, in this capacity, I audited the income tax returns and

books and records of practically every type of business corporation, including public utilities. On June 1, 1929, as the result of obtaining the highest mark in a competitive examination, I became the Chief Auditor of the Public Service Commission of Maryland, remaining in that position for seven years. I joined the staff of the Federal Power Commission on July 1, 1936, in substantially my present capacity.

For ten years I taught accounting in evening schools in Baltimore, Maryland, including eight years at Johns Hopkins University where I gave the course in accounting systems and for two years the course in cost accounting. These courses were for both day and evening students.

I have written several articles on accounting and economic subjects, including a text on accounting systems for my classes at Johns Hopkins. I have delivered more than fifty lectures, including two radio addresses, on accounting, financial and economic subjects.

While with the Maryland Commission, I did a good deal of work as consultant in accounting, taxation and finance in my spare time. On one occasion I obtained leave of absence to do some consulting work for the Tennessee Valley Authority and on two other occasions I was granted leave to act as consulting accountant to the Federal Power

Commission. On these latter two occasions I supervised the drafting of the Uniform System of Accounts which the Commission has prescribed for public utilities.

While in the employ of the Public Service Commission of Maryland, I had charge of all accounting, auditing and financial matters which were under the jurisdiction of that body. This included the making of the usual accounting investigations for all regulatory purposes, all studies relating to the issuance of securities, financial structures, rate of return, et cetera.

In my present position, I have charge of four divisions of the Federal Power Commission, namely, the Division of

Accounts, Division of Finance and Statistics, Division of Rates and Research, and the Division of Original Cost. Altogether, I have testified in more than thirty public utility cases.

Mr. Springer: Mr. Examiner, when Mr. Smith testifies on depreciation principles later, I would like to have him add to his qualifications.

Now, may I have marked for identification as Exhibit No. 57 and Exhibit No. 57-A, volumes I and II, entitled "Original Cost of Gas Plant as at December 31, 1938," referring to the Hope Natural Gas Company?

Trial Examiner: They may be so marked.

(The documents referred to were marked, respectively, as Exhibit No. 57 and Exhibit No. 57-A for identification.)

By Mr. Springer:

—2705—

Q. Mr. Smith, referring to the exhibits marked for identification as 57 and 57-A, are they the result of an accounting investigation undertaken in conformance with the original order of investigation in the Hope Natural Gas rate case? A. That is true.

Q. Was this investigation conducted under your general supervision and direction? A. It was.

Q. Will you explain how this supervision and direction were exercised? A. I exercised supervision directly by discussing with each examiner in charge the principles and the methods on the problem involved in the investigation. These discussions took place in the offices of the company, and in my office in Washington.

Supervision was also exercised indirectly through Mr. Baker, the chief accountant of the Commission, and Mr. Jackson, formerly assistant chief accountant of the Commission.

I discussed with these gentlemen all of the problems and methods involved in the investigation before they

visited the offices of the company to review the work, and had conferences with them upon their return.

Q. What were your instructions as to the determination of the original cost of the properties of the Hope Natu-

—2706—

ral Gas Company? A. The staff was instructed to determine original costs in accordance with the system of accounts prescribed by the Commission for public utilities and licensees.

At the time the investigation began, the Commission had not prescribed a system of accounts for natural gas companies.

I anticipated however that when the system of accounts for natural gas companies was issued, the original cost provisions would be the same as in the system for the electric utilities, and I was right in that anticipation.

Q. Is the system of accounts prescribed by the Federal Power Commission for natural gas companies substantially the same as the system of accounts adopted by the National Association of Railroad and Utilities Commissioners? A. Yes, it is almost word for word the same.

Q. And you have stated that some of the provisions are the same for the system of accounts prescribed for public utilities and licensees? A. Many of the provisions are the same, particularly the provisions relating to the determination of original costs.

Q. Are the provisions relating to original costs the same as those in the system adopted by the National Association of Railroad and Utilities Commissioners for electric utilities?

Mr. Cockley: I object to that. What has that got to do with what we are concerned with here?

—2707—

Mr. Springer: It shows the uniformity of accounting systems for all types of utilities. It is very proper, Mr. Examiner.

Trial Examiner: The objection is overruled.

The Witness: They are the same.

By Mr. Springer:

Q. Are such accounting systems in widespread use today? A. They are. The system of accounts for electric utilities is effective for about 95 percent of the industry, the electric industry, measured by revenues or plant.

The system has been adopted by some 29 commissions.

The system of accounts for gas utilities has been adopted by about 18 commissions.

Of course certain commissions have made some changes, primarily to conform to local conditions.

Q. Will you explain how the system of accounts for natural gas companies prescribed by the Federal Power Commission was compiled, showing particularly how uniformity was obtained by the national associations and the Federal Power Commission?

Mr. Cockley: I object to that. He is now going into how the uniform system of accounts was adopted. Are we going to try out the question of whether or not it was properly adopted, or what changes were made in going through its adoption, and so on?

—2708—

Mr. Springer: This is still the original objective of showing the uniformity and consistency in accounting principles in most of the systems of accounting in the United States.

Mr. Cockley: I submit it hasn't a thing to do with this present rate case. I haven't any objection to this witness testifying as to how much of this exhibit he accepts responsibility for, and what principles he instructed his subordinates to follow in carrying it out—I assume that that is his purpose—but to go into the history of the theory of accounting in the United States on these uniform systems of accounts, and how the Federal Power Commission has

prescribed for electric utilities or other utilities, or the National Association of Railroad and Utilities Commissioners has prescribed for other utilities, hasn't a thing to do with the simple problem we have got here.

Mr. Springer: It happens to be vital to the problem we have here. These are principles of accounting. Mr. Smith is taking the logical preliminary step of testifying on principles of accounting, and then he will show that they were employed in the preparation of this accounting exhibit.

Mr. Cockley: That isn't what your question asked, as I understand.

Trial Examiner: Read the question, please.

(The pending question was read by the reporter.)

Mr. Cockley: He wants to know how it was compiled.

—2709—

Trial Examiner: Well, it seems to me that it is somewhat remote, but it is perhaps preliminary to questions which will bring it up closer to our subject.

Mr. Springer: Precisely.

Trial Examiner: The objection is overruled.

Mr. Cockley: Note an exception.

The Witness: The Federal Power Commission retained me in 1935 to work with the Committee on Statistics and Accounts of the National Association of Railroad and Utilities Commissioners in drafting a new system of accounts for electric utilities.

As soon as that system was prepared, a system was prepared for gas utilities. I did very little work on the latter system at that time. The two systems were adopted by the National Association and the electric system was adopted by the Federal Power Commission. When the Natural Gas Act was passed, the Federal Power Commission instructed me to look towards the drafting of a system of accounts for natural gas companies.

I worked with the Committee on Statistics and Accounts of the National Association in compiling certain revisions of the system which had been adopted by that organization in 1936; when the revisions were agreed upon, they were adopted by the National Association, and the resulting system was adopted by the Federal Power Commission.

—2710—

It was in this manner that uniformity in the system of accounts, particularly uniformity in regard to provisions relating to original cost, has been obtained.

By Mr. Springer:

Q. Do you know of any other system of accounts promulgated by regulatory bodies which requires the keeping of plant accounts in accordance with what is known as the original cost principles?

Mr. Cockley: I object to that. There is no issue here at all about how a company should keep its plant account. This isn't an accounting case, but a rate case, and it is wholly immaterial.

Mr. Springer: This is in the category of the other preliminary questions, to show uniformity and consistency; and consistent with your former ruling I think you will have to rule in my favor this time.

Mr. Cockley: An earlier error doesn't excuse a later one, if I may suggest. (Laughter.)

Trial Examiner: Well, it seems to me that the Commission is raising some question here which will make this point directly in issue. The objection is overruled.

Mr. Cockley: Note an exception.

The Witness: The Federal Communications Commission in 1935 prescribed a system of accounts for telephone carriers in which the original cost principle is set forth.

—2711—

The system of accounts prescribed by the Interstate Commerce Commission for pipeline companies in 1935 likewise provides for original cost accounting, although the term "original cost" is not used. The language, in other words, is not the same, but the substance is there.

And the system of accounts adopted within the last five years by the National Association of Railroad and Utilities Commissioners for water companies, likewise provides for the keeping of accounts according to the original cost doctrine.

By Mr. Springer:

Q. How is original cost defined by the Federal Power Commission system of accounts? A. Original cost, as applied to gas plants, means the cost of such property to the person first devoting it to public service.

Q. Will you explain the general underlying principles of the original cost provisions of the uniform system of accounts for natural gas companies? A. Specifically, the original cost provisions relate to acquisitions of operating units or systems. As public utility operating units or systems are acquired, some means must be found for distributing the purchase price to the various accounts.

The purchase price usually contemplates the earning power of assets, the fact that customers are attached, the

—2712—

fact that properties acquired represent a profitable business, and other factors.

One of the most difficult problems of accounting involves the accounting for acquisitions of going businesses.

When one public utility acquires the properties of another, it is necessary to distribute the purchase price in some manner to the various accounts, as I have just indicated.

Heretofore, distributions often have not been made, and the purchase price has been continued as a lump sum in one account, without ever afterward changing it.

In a great many cases, the distributions were most unsatisfactory.

Accordingly, the system of accounts attempted to solve this problem by requiring the original cost of the acquired properties to be set up in the various plant accounts, and any differences between the original cost figure and the actual cost to the acquiring company, to be entered in a special account called Account 100.5—Acquisition Adjustments Account.

Mr. Cockley: Mr. Smith, pardon me, I don't like to interrupt you, and I apologize for doing it, but if you will read your answers a little slower, we will be able to understand them better, because you appreciate we have not had a copy of the answers from which you are reading.

The Witness: Mr. Cockley, I have just a few answers which I will read. Most of them will be delivered without

reading. The ones where I thought I might become involved, or go off on a tangent, I reduced to writing, but I will try to read those slowly.

Mr. Cockley: My point is that you were reading a little too rapidly to follow you.

The Witness: The original cost doctrine specifically relates to the acquisitions of operating units or systems.

By Mr. Springer:

Q. How are the costs of properties constructed by the accounting utility, accounted for, Mr. Smith? A. They are accounted for at cost to the utility according to an established plan of accounting. When these costs are accounted for by the utility according to a bona fide and acceptable accounting plan, and when the costs of operating units acquired are accounted for in accordance with the original cost principles, then we have the original cost of properties recorded in the various plant accounts.

Q. Well, is the original cost of the properties constructed by the Hope Natural Gas Company, the cost ac-

counted for in the past exclusive of errors in accounting? A. Yes, that is true. In other words, the cost of the company's own construction, as recorded on its books, except for accounting errors, is the proper original cost.

Q. Now, referring to the Commission's uniform system of accounts for natural gas companies, is there any

—2714—

authority under that system of accounts for a company like the Hope Company to re-account for its own construction in such a manner as to increase the amounts heretofore entered in the accounts, if the original entries were in accordance with accepted principles of accounting?

Mr. Cockley: I object to that. That exhibit speaks for itself. It is already an exhibit, as I understand it, in this case, and there is no occasion for asking the witness his construction of it; and it is wholly improper to do so unless some question arises about it.

Mr. Springer: Mr. Cockley, you prevailed with your objection to the admission in evidence of this document. It is not an exhibit.

But at the same time, we are talking about accounting principles and I am asking Mr. Smith a proper question in line with his development of the original cost principles.

Mr. Cockley: And the proper way to prove it is through the introduction of that exhibit in the case. If it now becomes relevant, whereas it wasn't before, the Examiner could admit it or not. But to have a witness testify that, taking this system of accounts—this is proper or that is proper, I submit is wholly improper.

—2715—

Mr. Springer: May I have marked for identification as Exhibit No. 58, a copy of the Federal Power Commission's uniform system of accounts prescribed for natural gas companies, effective January 1, 1940?

Trial Examiner: It may be so marked.

(The document referred to was marked as Exhibit No. 58 for identification.)

By Mr. Springer:

Q. Mr. Smith, I show you Exhibit No. 58 for identification. Is that the document you have just described? A. It is.

Q. Is that the system of accounts I referred to in my last question? A. It is.

Mr. Springer: I offer Exhibit No. 58 marked for identification, in evidence.

Mr. Cockley: There is no objection to the identification of this document, we admit what it is. I do object to it as wholly immaterial in this case, and I want to preserve that objection of record.

Mr. Springer: It happens to be the crux of the case, Mr. Trial Examiner.

Mr. Cockley: Well, somebody else than you will decid that, I am happy to say.

Trial Examiner: The objection is overruled. Exhibit

—2716—

No. 58 is admitted into evidence.

(Exhibit No. 58 received in evidence.)

Mr. Cockley: Note an exception.

Mr. Springer: Will you please read my original question to Mr. Smith?

(Whereupon, the reporter read the pending question.)

Mr. Cockley: That question I object to. The system of accounts is now in evidence and will speak for itself.

Trial Examiner: Well, it seems to me that the form of question is perhaps somewhat objectionable, but the substance of it is rather important and proper. The objection is overruled.

The Witness: The answer is no, and that has been my consistent interpretation of the system of accounts and the companion system, the one for electric utilities, since they

were adopted; and I might add that I am authorized by the Commission to issue interpretations over my own signature, and I have made many such interpretations.

By Mr. Springer:

Q. Will you please define reaccounting as distinguished from reclassification of accounts? A. Reclassification is a distribution of the amounts in the accounts—

Mr. Cockley: (interposing) I don't like to object all the time, but I want to object to this question. There is no

issue here at all about the method of reaccounting or reclassification, as I understand it; and may I have a general objection here to these general accounting questions that are not related specifically to the exhibits in this case, and then I will retire in peace and let him go ahead?

Trial Examiner: Yes, I think that would be proper.

Mr. Springer: I would like to have a statement then that all of the accounting principles are related and embodied in the proposed exhibit on original costs.

Trial Examiner: The general objection is overruled; you may have an exception.

By Mr. Springer:

Q. Will you please start again, Mr. Smith, on the distinction between reaccounting and reclassification? A. Reclassification is a redistribution of the amounts in the books of account. Reclassification deals particularly with what we know as real accounts, that is the balance sheet accounts.

The accounting system provides for a reclassification in that it provides that certain amounts recorded at one place in the balance sheet shall now be transferred to another account. Particularly is this true in respect to plant accounts. We have different plant accounts in which the amounts in the books are redistributed.

Reaccounting on the other hand goes not to the clas-

—2718—

sification so much as to the amounts themselves.

By reaccounting we mean going back to the time of the original transaction and restating that transaction so as to get a different cost, different plant cost, a different cost of some real account than appears in the books in respect to the transaction.

Q. Well, in consequence a reclassification does not change the total dollars in plant accounts, does it? A. That is correct.

Q. But a reaccounting may? A. Yes.

Q. Which is improper? A. It is improper, a reaccounting generally is improper. I want to make the reservation that it is always proper to correct pare accounting errors.

Q. Will you explain any provision in the system of accounts which prohibits the reaccounting which you have described? A. Gas plant instruction 2(b) deals with this matter, and the particular part of that instruction which is pertinent reads as follows:

> "It is likewise not intended that adjustments shall be made to record in gas plant accounts amounts previously charged to operating expenses in accordance with the uniform system of accounts in effect at the

—2719—

> time, and in accordance with the discretion of management as exercised under such uniform system of accounts."

Q. Will you please explain that provision? A. In other words, reaccounting does not conform to sound principles of accounting, and this provision was inserted in the system of accounts to make doubly sure that no one would construe the system of accounts as authority for such reaccounting.

Q. Suppose the cost of the company's own construction was entered in its accounts at a time when regulatory commissions had not prescribed systems of accounts, could the company under the system of accounts now in effect reaccount for items accounted for during this period? A. If your items were accounted for properly in the first instance, they could not be reaccounted for, in my opinion.

Q. Do you care to elaborate on that, Mr. Smith?

Mr. Cockley: I object to it. The witness has answered the question.

Trial Examiner: Objection sustained.

By Mr. Springer:

Q. That is, the determination of cost is one of the chief purposes of accounting? A. The determination of cost is one, if not the chief, purpose of accounting, but many kinds

of cost are involved in accounting.

We have costs of plant and we have costs of operations. [redacted] the most difficult accounting problems is the [redacted] costs to a particular operating period such as [redacted]

[redacted]re is no precise answer in regard to the latter problem. Considerable judgment must be used in allocating costs to a particular period of time, and in this field considerable discretion is allowed under the accepted principles of accounting.

Q. Is it as difficult to determine the revenues for a period as it is to determine the costs? A. No, it is not. Ordinarily, there is very little problem in ascertaining the revenues over a particular period, but where a company expands its business and it has betterments and improvements, the difficulty of determining the cost of operations, the cost of keeping up that business, and the cost of the additions and betterments, is sometimes pretty great. It is in this particular field that considerable discretion is allowed in the field of accounting.

—2721—

Q. Then it is difficult to draw the line of demarcation between the cost of the additions and maintenance expenses, I take it? A. Yes, it is difficult, and that is recognized by all accountants having any real experience in that particular field.

Q. In that particular field is it necessary to be consistent? A. It is necessary to be consistent; in fact, consistency in this respect is of particular importance. The principles followed by a company should be consistently applied from year to year. Changes, of course, are permitted, but in public utility accounting, at least, they should be adopted for the future and properly explained.

The absence of consistency in the application of principles may lead to most inequitable results. In fact, failure to be consistent in matters of accounting may lead to distortion and manipulation.

It would be an easy matter to manipulate a financial statement by merely being inconsistent in the treatment of important items from year to year.

This view is so widely held that practically all certificates of public accountants to financial statements now contain a positive assertion with reference to the principles of consistency. The certificate, sometimes called the short

—2722—

form of report, recently approved by the American Institute of Accountants in connection with statements to the Securities and Exchange Commission, reads in part as follows:

> "In our opinion, the accompanying balance sheet and related statements of income and surplus present fairly the position of the XYZ Company at February 28, 1941, and the results of its operations for the fiscal year, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year."

The emphasis on consistency is apparent.

To illustrate that point, if well drilling costs were charged to expense during the years large profits were realized, and if they were capitalized during poor years, distorted statements would be reflected and manipulations consciously or unconsciously practiced.

Such statements could not help but be misleading. Hence the importance of the principle of consistence in accounting.

Q. Now referring to the Federal Power Commission System of Accounts for Natural Gas Companies again, Mr. Smith, do variations exist in accounting under that system of accounts? A. They do.

Q. Will you explain some of those variations? A. Some companies capitalize no general and administrative expenditures at all, whereas other companies capitalize as much as possible under accepted accounting principles.

—2723—

Some utilities add all the interest possible to plant costs, whereas others contend that if they do not pay interest, no interest should be charged to plant assets.

Some companies try to determine the exact time of each laborer, of each mechanic, spent on each job, and charge the specific labor cost to that job; whereas, others use an average rate, such average being based in some instances upon a crew of workmen, and in some instances for an entire group or a division, and in some instances yearly averages of pay, with proper adjustment allowances for sick leave and vacation, are reported.

Sometimes the labor cost is associated with a machine, such as a steam shovel, and a machine hour rate includes the labor rate.

Many variations likewise exist in regard to accounting for materials.

Except for large identifiable units, many materials must necessarily go into plant, and into operating expenses at average cost of one kind or another.

Thus a stock of pipe of a certain size may have been acquired at various unit costs. When the pipe is used for maintenance purposes, and for the purpose of making additions and betterments, some assumption, such as the "first in—first out," or some average cost, is employed, and very frequently this average cost gives recognition to re-used

—2724—

materials on which the original cost, the actual specific original cost, cannot be found.

There is no certainty that the particular piece of pipe that was charged to plant was charged at the actual cost of that particular piece of pipe. There is no reason, in fact, why this should be so.

Many practices regarding the replacement of property have existed in the past, and the practices today are not altogether uniform.

A study of the reports of American Railroads to their stockholders during the last century, will disclose many interesting illustrations of the difficulties of determining the difference between what should be charged to maintenance and what should be charged to plant.

The area of choice in maintenance accounting has been somewhat restricted under our system of accounts by the prescribing of a list of retirement units of property, but even under that list, variations still exist.

Thus, while there are broad principles of accounting, variations exist between these principles. No one can say that one particular variation is absolutely correct, and another absolutely wrong. No one can say, for instance, that only one method of accounting for labor costs is proper. Many methods of accounting for labor costs are in vogue, and the question is not so much what is right or

—2725—

wrong, but rather what is the better practice in a particular case.

This statement is likewise true as to material costs and it is even more true as to accounting for overheads.

In accounting for overheads, there is no one best method of distributing the amount. The method must necessarily be somewhat arbitrary. Certified public accountants do not hesitate to certify statements which do not conform to what they deem might be the best method. The same firm of accountants, in fact, frequently certifies to statements of different companies, employing different methods such as I have just outlined, and as far as I can see, they are right in both instances.

Q. Mr. Smith, assuming that a transaction is accounted for under one of the permissible variations, should it later be re-accounted for?

Mr. Cockley: I object to that. There is no evidence of any such thing in this case, nor will there be.

Mr. Springer: This is a question directed to the principles of accounting.

Trial Examiner: The objection is overruled.

Mr. Cockley: Exception.

The Witness: Once a transaction is accounted for by consideration of the entire setting at the time of the transaction, and has been accounted for under one of the alternatives of accounting principles, it should not be changed

at a later date, particularly when the change is brought about merely because someone thinks a better answer could be obtained. If the accounting in the original instance conformed to sound principles, it should remain accounted for in that fashion, and that is especially true of businesses such as public utilities, in which there is a deep public interest.

Trial Examiner: The hearing is recessed, to reconvene at 2 o'clock.

(Whereupon, at 12:40 o'clock p. m., a recess was taken until 2 o'clock p. m., of the same day.)

—2727—

Afternoon Session.

The Trial Examiner: Gentlemen, the hearing will now be resumed.

Mr. Cockley: Before we proceed with the examination of this witness, Mr. Examiner, I would like to direct attention to the situation that is causing us considerable delay in the preparation of this case.

One of the principal exhibits that has been furnished us, and one that will soon be offered in evidence, if not the next, after these original cost exhibits are out of the way, is an exhibit that was prepared by Mr. French, of the Commission's staff, showing estimated lives of various classes of properties, which is a fundamental exhibit on which the depreciation determination is to be made.

We advised Mr. Springer on April 1st, when we received that exhibit, that we would have to see Mr. French's working papers to see what he had done, because the exhibit itself does not disclose that fact. We were told that he would not be available the coming week but would be on April 14th. On that date a couple of our men did interview Mr. French and asked for copies of various working papers that were necessary in order to understand what he had done. He insisted upon having copies of those prepared himself. They were not delivered to us until Saturday night, April 19th, after we got down here.

—2728—

Then, it developed this morning on the pipe accounts that we had no working papers on the other accounts, and that the papers on the pipe accounts lacked some key information that was necessary to a complete understanding of them.

We are now told that other work papers absolutely essential to any preparation of any examination of this exhibit will not be ready until Wednesday or Thursday of this week.

It is obvious, of course, that we can not examine them and be prepared to cross examine immediately upon their production. I would like to call that to the attention of the Commission and the attention of counsel to see if we can not have some arrangement by which we will get the work papers within a reasonable time so that we can prepare for cross examination.

Mr. Springer: We endeavor to accommodate counsel in each case. Mr. French was on a field assignment, which prevented our having access to his work papers to be reproduced for the convenience of the company men. But we will continue to cooperate with them to the best of our ability.

Mr. French was sent to New York the first part of this week. That is the reason for the delay in connection with the additional work papers that Mr. Cockley men-

tioned. Of course, we will furnish them. They are surely entitled to them. It is just a matter of a man working concurrently on more than one case; and he can not be at the Washington office at all times.

The Trial Examiner: Does he have to be here?

Mr. Springer: Yes, sir. They are his working papers. I think it is necessary when experts examine the work papers of other experts that the man who employed them as a foundation for an exhibit should be present. That is a matter of professional courtesy, as I understand it.

The Trial Examiner: I understood the work papers were being reproduced to be delivered to the company.

Mr. Springer: That is correct. The matter of the time required for reproducing the work papers I believe is the explanation of the delay.

We will continue to cooperate as much as we can.

The Trial Examiner: What I am trying to find out is why the work papers were not available at the time the exhibit was served. It seems to me that Mr. French must

have known that the work papers would be required and arrangements might have been made to make them available.

Mr. Springer: That is correct. And arrangements were made when he returned from the field on April 14th and working papers were made available to representatives of the company who were present. And they have accom-

—2730—

plished a certain amount of the objective undertaken at that time. And when Mr. French returns tomorrow we will do our best to give them rapid service on any other working papers copies of which they desire to have.

The Trial Examiner: You may proceed with the examination of the witness.

---

Charles W. Smith resumed the witness stand, and having been previously sworn, testified on behalf of the Commission as follows:

Direct Examination by Mr. Springer (resumed).

Q. Mr. Smith, do you have in mind the last question I asked you before the recess? A. I do not have the answer to it, but I do recall answering the last question fully.

Q. Mr. Smith, if a transaction is accounted for under one of the permissible variations, should it later be re-accounted for? A. That was the last question that was answered.

Q. Your answer was that it should not be re-accounted for, as I remember it. Does your answer imply that accounting errors should not be corrected? A. No, sir. Accounting errors should be corrected as soon as they are discovered. However, a distinction must be made between an accounting error and a correction of an accounting error

—2731—

and re-accounting.

Accounting errors represent mathematical errors errors in posting and entries of transactions which were not in accordance with the principles of accounting. Re accounting is the restatement of the amounts which were entered properly in the first place to conform to some different condition.

To repeat, accounting errors should be corrected as soon as they are discovered.

Q. What is your definition of accounting errors? A. My definition of an accounting error is an entry which is an error in posting, a mechanical error, or an entry which did not conform to sound principles and practices of accounting.

Q. Would unrecorded retirements be an example of an accounting error? A. Yes, it would be. Where an item of property is in fact retired without any replacement having been made and an entry to record the retirement is not made on the books, that is an accounting error, known as an error of omission.

Q. Mr. Smith, it is sometimes said that, for the purposes of a rate case, we must compute the maximum cost of plant now in existence, regardless of how such costs were originally accounted for. This may mean that general

administrative expenditures which were never capitalized should now be restated and included in plant and that items previously charged to maintenance should now be capitalized. In fact, statements of cost conforming to this principle have been filed as exhibits in this case. In your opinion, is it necessary or is it proper to re-account for transactions in order to get the maximum costs which I have just described? A. My answer is no.

Q. Then, you do not agree with the statement I have just made, that for the purpose of accounting and for the purpose of a rate case, you must follow the principle of getting the maximum costs of the property regardless of

how such property was originally accounted for? A. No, most positively I do not agree.

Q. Will you please give an explanation of the reasons for your answer? A. Accounting does not deal with plant accounts alone. It is most important to recognize this fact. Accounting does not, in fact, emphasize particularly plant accounts. Expense accounting is just as important as plant accounting. It is just as appropriate to get all possible costs in the expense accounts as it is to get all possible costs in the plant accounts. All the phases of a transaction must

be analyzed at the time of the transaction in order to determine upon the correct entries. Plant phases and operating phases must both be considered. The answer must give proper weight to all factors. If we follow blindly the principle that all possible costs must now be assigned to plant, we fail to visualize the accounting process in all its entirety. We then make a fetish of plant costs. We forget that in determining upon an entry, many more things than the cost of additions and betterments are involved in accounting and in the running of a business. To repeat, all phases of the transaction must be studied and to concentrate on one phase only, that phase being how much can possibly be charged to plant accounts, warps the principles of accounting. Such false emphasis gives no heed to the cost of operating and maintaining the plant. It follows blindly an abstraction in a practical field of endeavor.

Q. Will you show how your reasoning applies in the case of general, administrative expense? A. Our System of Accounts permits a reasonable amount of the salaries of officers, general office clerks, and other general and administrative expenses, to be charged to plant accounts. I might note that the System of Accounts of the Interstate Commerce Commission does not permit such items to be allocated or prorated to plant accounts. Such expenditures, however, may, under our System of Accounts, be

—2734—

charged in toto to expense or a reasonable amount may b prorated to plant. The expenditures, of course, cannot b identified with any particular plant item and at best w can merely find a scheme of allocation, or proration, whic will be deemed satisfactory. There are many variation in practice in accounting for the general and administra tive expenditures which I have just described. It is no unnatural that this would be so because such expenditure are associated with all phases of the business, operations maintenance, additions, betterments, the payment of divi dends, interest, etc. There is no such thing as a one an only rule to follow in accounting for these expenditures My own personal view is that the better practice is t charge such items to expense, except the specific, incre mental costs which are incurred in connection with con struction and these should be capitalized.

My reason for this view is that a utility is in busines primarily to sell service or a commodity and not for th purpose of constructing additions and betterments, whic are only incidental to the former. General and administra tive expenses do not, in fact, fluctuate proportionatel with construction and they should not be made to do s arbitrarily by some method of accounting.

If, to repeat, a utility determines that these items ar expenses, I would recommend that the amounts be treate

—2735—

as expenses. If a utility charges a reasonable amount t construction, I would make no change for such accountin is satisfactory. When, however, such items are first charge to expense, as being a part of the cost of operating the bus ness and then they are restated in plant, under the theor that the maximum cost of all plant items now in existen must be included in the plant accounts regardless of pa accounting, a serious offense, I believe, is committed. Suc a practice, to repeat, would emphasize only one phase

accounting, namely, plant accounting. It would represent clearly a one-way street. It would treat plant costs as the end and purpose of accounting, and of business. The expenses I have mentioned are in reality joint costs and, as to joint costs, we all know that precise cost determinations are not possible of achievement. Where a reasonable and generally satisfactory answer has been obtained, it should not thereafter be vitiated by changing the philosophy of accounting so as to forget the entire setting of a transaction at the time of its occurrence and now aim at the highest plant costs obtainable under any principle.

Q. Will you please explain your answer from the viewpoint of maintenance accounting? A. I have already pointed out that there is no sharp line of demarcation be-

tween the cost of adding to a plant and the cost of maintaining it. Before our recent system of accounts for natural gas companies was adopted, much more discretion was allowed in the field of maintenance accounting than is now permitted. Many replacement items formerly chargeable to the maintenance accounts must now be charged to plant and the cost of the old items removed. It is still the practice of railroads, for instance, to charge the cost of numerous replacements to expense. We have tried to obtain more uniformity in the field of maintenance accounting. Toward this end, the Commission has prescribed a list of what is termed "retirement units of property" which is required to be adhered to, with some slight exception, by natural gas companies. This list shows the items which, when replaced, must be treated as plant retirements and plant additions. If two lengths of gas mains, for instance, are replaced, the cost of the old mains must be taken out of the plant accounts and the cost of the new added thereto. If a single length is retired, plant accounts are not disturbed, but the cost of the new length is charged to maintenance.

The exception I spoke of a moment ago is that natural gas companies may refine the retirement list—may have more retirement units, in other words—but they cannot consolidate them. Again we have not established a principle of pure accounting science in drafting the list of re-

—2737—

tirement units. Rather we have been somewhat arbitrary in order to obtain better results and, in particular, more uniform results. In compiling the list of retirement units, representatives of the industry participated in the discussions. All such representatives were aware of the fact that we were trying to determine upon some good workable rule in the interest of uniformity, rather than to announce a new principle of accounting.

It cannot be said that the old practices of natural gas companies in regard to maintenance accounting are wrong and that the new methods are absolutely right; rather the new methods were designed to obtain better results and not to correct something which was absolutely wrong. To hold otherwise would be to hold railroad accounting of today to be wrong. When we follow the principle of obtaining all possible costs of existing plant regardless of how the costs were accounted for previously, we forget, in fact we close our eyes to, maintenance practices. A new cost is then assigned to each existing item of property. If a railroad tie or a piece of iron pipe represented a replacement which was charged to maintenance expense, its cost is now included in the plant accounts. Under such a one-way scheme, accounting cannot function unless we make every conceivable expenditure associated with plant a unit of property and require it to be charged to plant. This

—2738—

would be a new kind of accounting. It would emphasize plant costs to the exclusion, or almost the exclusion, of operating costs. Conceivably under it, every time we would paint a structure we would have a new cost of the struc-

ture. Every time we replaced a tire or a tube or a brake lining, we would have a new cost for the automobile. This would be most unfortunate, in my opinion.

Q. Mr. Smith, are deferred debits and deferred charges synonymous in your terminology? A. They are frequently used synonymously. I might add that there may be a difference. I will have to know the connection in which you use the words in order to give you a technical answer.

Q. Sometimes, Mr. Smith, it is said that plant assets are deferred charges. Is that true? A. Yes; that is true. In the broad sense the cost of plant assets represents a deferred charge. You buy a piece of equipment, an automobile today, and it is capitalized and it is charged off during an operating period or over operating periods. In other words, its cost is deferred in part to the revenues of the future. In a sense, all plant assets are deferred charges.

Q. Is it easy to determine how much of such deferred charges is a proper expense of a given period? A. No; it is not. It is rather difficult to determine how much of

the deferred charge representing large plant assets should be charged to a given operating period. A great deal of judgment must be exercised in making that determination. And that is one reason why business men, who are naturally conservative, are reluctant to add too much to deferred charges and postpone too much to the future. Generally speaking, in case of doubt, business men and accountants generally prefer to charge an item to expense today rather than defer it over the future. That is, naturally, conservatism, and it represents good, sound practice, in my opinion.

Q. In Exhibit No. 20 the company shows the addition to the book cost of plant of about $17,000,000, under the theory that that amount must be added to book figures to obtain full and complete cost of plant in existence as of the end of 1938. Did you discuss these items with the staff and did you agree as to how such items should be treated?

A. We did discuss that. I discussed the items with the staff, and we are agreed as to their treatment. In fact, there was no disagreement on the part of any staff member.

Q. One of the adjustments proposed by the company in the exhibit mentioned related to overheads. Did you instruct the staff to add these overheads to the recorded

—2740—

cost of plant? A. I instructed the staff not to add the recorded expense items to the cost of plant.

Q. Why?

Mr. Cockley: I object to the long detailed reasons as to why it was done. He said what he did. Isn't that what we are interested in?

Mr. Springer: We are interested in this principle of accounting.

Mr. Cockley: If he thinks what he did needs some defense, yes. But it seems to me that it is a complete and perfect answer when he says "I instructed the staff to do so and so."

Mr. Springer: I thought it would be enlightening to have his reasons on this principle of accounting. We are on a vital point in this case, and he has already testified that he is responsible for the interpretation of the system of accounts for this Commission; and he is a most eminent authority on it.

Mr. Cockley: The accounting lecture that we have had so far was very interesting; but I can not see that very much of it has anything to do with Exhibit No. 57, except that it is apparent that Mr. Smith instructed the staff what to do with certain items.

Mr. Springer: I think it is important to have his rea-

—2741—

sons and why he gave such instructions.

The Trial Examiner: The objection is overruled.

Mr. Cockley: An exception, please.

The Witness: The company did not charge general and administrative overheads to the plant accounts at the time the original entries were made. This was its consistent practice. The practice of the company was not an unusual one at all, but I believe it conformed to the practice of the majority of natural gas companies. It conformed to sound accounting of the time and sound practices of today, in my opinion. I know, for instance, that many public utility companies do not include such overhead expenditures as a part of their plant cost at the present time. The items in the instant case have been properly charged to expense and, in my opinion, they should remain there. It would be wrong, therefore, to include such items in plant now and start depreciating them and perhaps allow a return on them. Such a practice would be bad accounting and, in my opinion, bad regulation as well. The addition of the overheads mentioned to the plant accounts would clearly not represent the correction of an accounting error. It would merely be substituting one alternative method of accounting for another which was used in the regular course of business and which was reflected in the financial statements prepared by the company, in its income tax returns, etc.

—2742—

The practice there conformed to sound practices of the time and, I think, sound practices as of today. I think it would be a write-up of accounts to permit those items to be included in plant today, either for accounting purposes or for rate making purposes.

By Mr. Springer:

Q. On Exhibit No. 20, about $11,000,000 were added to the book figures for drilling costs which were originally charged to expense and not capitalized. What was your instruction to the staff regarding those items? A. I instructed the staff not to add that amount to the plant cost.

Q. Why did you give that instruction?

Mr. Cockley: May I have an objection to all of these why's? I take it that I may.

The Trial Examiner: Yes. The objection is overruled.

Mr. Cockley: An exception, please.

The Witness: From the inception of the company to the end of 1922, the company charged such expenditures to operations, that is, to expense. The practice conformed to the practice of natural gas companies at the time. Inasmuch as it conformed to good practice, I believe it would be wrong to permit the restatement of such items, to include them in plant accounts today.

There can be no doubt, in my opinion, but that it was

—2743—

the widespread practice and good practice at the time to charge such expenditures to operations. And I say that not only for natural gas companies, but all companies in other extractive industries as well.

By Mr. Springer:

Q. Then, it follows that the practice in not capitalizing the costs at that time was not an accounting error? A. That is correct.

Q. Will you state why you think the charging of such items in that manner conformed to good practice at that time? A. Our study of the subject shows that the practice was widespread. In fact, I understand the practice still continues in the case of certain oil companies. The practice of charging intangible costs to expense was strongly advocated by the natural gas industry. The practice was changed, in my opinion, only because a change was required by regulatory commissions. I happened to be in the Income Tax Unit of the Internal Revenue Bureau when the question as to proper treatment of the so-called drilling costs—

Mr. Cockley: I object to this as wholly aside from anything that we have here now. Now we are going into

the personal experiences that he had in the Bureau of Internal Revenue. That is not responsive to the question.

The Trial Examiner: Well, he is testifying as to ac-

—2744—

counting principles and practices. I presume he intends to develop something relating to the practices.

The objection is overruled.

Mr. Cockley: An exception, please.

The Witness: I was in the Income Tax Bureau when this same question was presented. I had to make decisions on the subject at that time. The Income Tax Bureau ruled that such costs could either be capitalized or charged to expense at the election of the utility, provided the practice first established was consistently applied. A change after a practice had been established could not be made.

This is still a part of the Income Tax Regulations and will be found in Section 19.23(m)-16 (1) of Regulations 103.

I have made inquiry and find that most natural gas companies today continue the practice of charging well drilling expenditures to expense for income tax purposes. That was not something peculiar to the income tax law, because the income tax law of 1918 provided, among other things, in general language, that the books of accounts should be used where they properly reflected income.

When a system of accounts for natural gas companies was under consideration in 1919 by the Public Service Commission of Pennsylvania, the Natural Gas Association of America strongly urged that the expenditures mentioned be treated as operating expenses. They argued that such

—2745—

items constituted expenses. The Commission held, however, that the costs should be capitalized. This is a better practice from the regulatory viewpoint for many reasons. It is the practice required by our present system of

accounts. It, too, is more in line with present theories of accounting.

The decision of the Pennsylvania Commission was the first which to my knowledge required the capitalization of intangible production expenses. Other commissions followed the Pennsylvania Commission. I fully believe that regulatory commissions are responsible for the change from treating such items as operating expenses, to the requirement that they be capitalized. Some oil companies, as I have pointed out, still follow the old practice.

In general, intangible production costs were deemed to have been incurred to keep the company in business. Extractive businesses are often looked upon as single ventures. Under this viewpoint it was held the chief purpose of drilling new wells was to keep the company going. It was believed unwise to defer such costs over a future period. This is not an unusual principle as far as the extractive industries are concerned. Quite generally, items are charged to expense in such industries when they would be charged to capital by other business enterprises.

I know from having audited a great many accounts

of mining companies, that many items normally capitalized in the manufacturing and commercial institutions are charged to expense by the extractive industries.

By Mr. Springer:

Q. Mr. Smith, I understand that the company, the Hope Natural Gas Company, for the years 1918 to 1922 charged off the cost of direct labor incurred in laying mains and similar labor in connection with compressor station construction and equipment installation. Is that true? A. I believe it is.

Q. What were your instructions in regard to those costs? A. I instructed the staff to include them in plant account.

Q. Why? A. First of all, the items were actually capitalized by the company in the first instance. After being capitalized they were arbitrarily written off at the end of the year in which capitalized. The company's practice did not conform to general practices or to accounting theory. Its practice, for this period, was an accounting error. I believe the practice was resorted to primarily to have the items allowed for income tax deductions, although I do not have any positive knowledge that this is true. In any event, I am of the opinion that an accounting principle was

—2747—

violated by charging off the capitalized items, therefore the amounts should be added to the plant accounts, as far as the general principles of accounting are concerned. I recognize, of course, that a different conclusion from what I have given may obtain for rate-making. It is possible that once a charge is made against customers in calculating rates, even though the charge were made in error, the same charge should not be exacted again. However, at this particular time, I am addressing myself to accounting principles and, as far as accounting principles are concerned, I believe it is proper to state the direct labor costs I have described as a part of the cost of plant.

Q. I understand, Mr. Smith, that the company in Exhibit No. 20 made certain adjustments to the book cost of plant so as to conform to an inventory of its property which it compiled as of the end of 1938. What were your instructions regarding these adjustments? A. I instructed the staff to accept the company's adjustments. The inventory adjustments represented in the main a correction for unrecorded retirements. In other words, the company's invento disclosed what we expected to be the fact—that a lot of property items had, in fact, been retired without a concomitant entry having been made in the books of account.

—2748—

In addition, however, there was disclosed many items which did not appear in the books. We accepted those items because we believed in large measure that they offset some of the items which were retired.

The problem of identification where an inventory is taken is enormous. Very frequently items are considered to be unrecorded retirements when, in fact, another item taking its place is added. The difficulty of identifying the units of property with the actual dollars is a great one. So we have accepted the inventory adjustments which, as I have indicated, in the main result in a correction for unrecorded retirements.

Q. Are there any other adjustments to the book figures which you wish to discuss? A. There were many adjustments made to the book figures, but most of these do not rest upon the fundamental principle that I am testifying to at this time.

Q. You have testified as to the original cost as contemplated by the Commission's Uniform System of Accounts for Natural Gas Companies. Does that cost, in your opinion, have any validity for any purpose other than matters of accounting? A. In my opinion, such costs should be considered the original costs for rate making and for all other purposes of regulation. In fact, I think they are

—2749—

the only valid costs for that purpose.

I make one exception to the latter statement, an exception which I have noted before, and that is where an item has been charged to expense in error, an item which should be charged to plant, there would still be considerable justification for the Commission's treating that item as an expense. And I think as far as costs are concerned, with the exception I have mentioned, costs computed in accordance with the Commission's uniform system of accounts are the only valid costs.

Q. What do you mean by "valid costs"? A. Costs, to have any validity for regulatory purposes particularly, must be cost computed in accordance with a definite scheme of accounting. In other words, as I have previously testified, in determining cost of plant and in determining the cost of operations, all phases of the particular transaction should be considered before the accounting entries are determined upon. If this is done, the resulting plant costs are valid, but if the costs are included both in expense and then restated in plant, the plant costs are, in my opinion, invalid. It would be most unfortunate, most inequitable, to follow abstractions in this matter and not give consideration to actualities. Items which are expenses should re-

—2750—

main expenses; items which are plant costs should remain as such. There is no validity, to repeat, to plant costs which are determined by transferring thereto previously recorded operating expenses after the operating expenses have served their purpose. Only costs which square with the treatment of operating expenses have any integrity for rate-making purposes, in my opinion. In this connection, I would like to cite a very pertinent example.

Today we treat delay rentals as expenses. Now, under the principle of determining maximum or abstract costs, delay rentals should be charged to plant. Delay rentals can be identified directly with particular leases. These costs are incurred before production is obtained. They represent a cost of carrying the leases until drilling is completed. If we follow the cost principle blindly, delay rentals should be charged to plant as a cost of the leases. There can be no question concerning this statement, in my opinion. Yet we have knowledge of only one company in the United States which capitalizes delay rentals and I understand that that company is glad to cease the practice.

Delay rentals are treated as expense because it is not deemed wise for a natural gas company to capitalize such items and postpone indefinitely in the future the charging

—2751—

of them to expenses. In other words, there is an overwhelming consensus of opinion that delay rentals constitute a current expense which should not be capitalized in spite of all the finely spun theory to the contrary. Even witnesses for the company have not followed this fine theory, although it is no more tenuous than the theory supporting adjustments for well drilling costs, overheads, etc. It seems to me to be axiomatic that if delay rentals are treated as operating expenses today, they should never be re-accounted for in the future as plant costs.

The only valid costs, to repeat, would be those which give recognition to the original treatment of delay rentals. If delay rentals are currently charged as operating expenses and years later they are added to plant costs, I submit that plant costs will have no validity whatsoever. Valid plant costs, to reiterate, are only those which give full recognition to all phases of the accounting process—expense accounting as well as plant accounting.

Q. Mr. Smith, financial statements are made in the ordinary course of business by the management, are they not? A. Yes; they are constantly being used by management.

Q. And on those financial statements information the management make their decisions, do they not? A. Yes, indeed. As a matter of fact, I believe it was Stuart Chase who said that when a business gets so large that one man

—2752—

can't take care of all of its details, accounting takes over. Naturally, financial statements are relied upon by executives in making their decisions.

Q. While re-accounting may be proposed by the utility, can it go back and undo the transactions which the

company entered into and the decisions which it made as a result of the facts shown by such statements? A. No. It is easy enough to transfer figures; and it is easy, the easiest thing in the world, to put another figure in the plant account and make the contra entry somewhere else in the books; but the decision of the management on the facts shown by the financial statement in the past can not be changed.

To give an example, natural gas companies generally consider well drilling expenses as expense. Undoubtedly their decisions were based upon that concept, and undoubtedly the practice had a good deal to do with the rates, charges and revenues of the companies. We can not go back and restate those matters of substance; we can not go back and make new rate contracts. It is an easy matter to change the accounting, but the substance remains permanently fixed.

Q. Have you made many accounting investigations for the purpose of determining original cost? A. I have.

—2753—

Q. How many? A. I don't know, but I have made a good many.

Q. Have the principles testified to by you in this proceeding been applied in making those investigations? A. They have; and they have been consciously applied. Offhand I do not recall any more than two cases where I have restated the general administrative expenses. And yet I am familiar and was familiar at the time of making the investigation of many practices of accounting with regard to them. After studying such instances, if I deemed that they were accounted for under one of the alternative methods I made no change.

That applies with equal force as to the accounting for maintenance items. That makes me more than amazed when I find companies claiming that such items are now to be charged to plant accounts.

Q. The accounting principles to which you have now testified are applied and embodied in the original cost exhibit marked for identification as Exhibits 57 and 57-A, are they not? A. That is true.

Q. In the exhibits marked for identification as Nos. 57 and 57-A, is the cost on the company's books as adjusted by the Commission's accounting examiners synon-

—2754—

ymous with original costs as you have defined it and in accordance with the Commission's system of accounts? A. Yes, to the extent that it relates to property shown in the exhibit. In other words, I make one qualification. We did not go into the distribution property of the company. And except for that one variation, the original cost is correct.

I had better change that. The statement shows the original cost of the company's property, excluding the distribution property.

Q. Mr. Smith, I believe that Mr. Antonelli, who sponsored Exhibit No. 20 showing the claimed original cost of the company, said he based his study upon the West Virginia System of Accounts for Natural Gas Companies. Are you familiar with that portion of the record? A. Yes. I believe that is correct.

Q. Are the provisions of the West Virginia System of Accounts and the Federal Power Commission system of accounts for natural gas companies substantially the same? A. They are substantially the same. They were not word for word the same until November 29, 1940, when the West Virginia Commission amended its system. I happened to know about the amendment before it took place. I agreed therewith. The amendment does not change the principles at all.

—2755—

We have constantly interpreted our system of accounts to mean what the West Virginia Commission's system of accounts now reads with the amendment I just described.

Q. Then there is no difference between the West Virginia system and the Federal Power Commission system accounting principles and original cost principle to which you testified? A. Certainly not as to original cost.

Q. Mr. Smith, referring to the exhibit on original cost in two volumes, marked for identification as Exhibits 57 and 57-A, and written statements and supporting schedules in those two volumes, if appropriate questions were directed to you, would that be your direct testimony in this case? A. It would be my direct testimony in this case so far as principles are concerned. It must be remembered that we had as many as thirteen men on the assignment and, naturally, I could not check the details of the work of those thirteen men. As a matter of fact, I did not attempt to do so. The mechanics, the figures, the computations, etc., represent the work of others.

Q. Naturally. But your instructions on principles are embodied in this original cost exhibit? A. That is correct.

Mr. Springer: That is all the direct testimony of Mr.

Smith at this time.

Mr. Cockley: I am prepared to cross examine Mr. Smith, subject perhaps to some further cross examination if after his testimony is written up and we can see it, we desire to do so. But I understood from Mr. Springer that for the convenience of Mr. Smith he wanted to have him testify at this time on principles of depreciation.

Mr. Springer: That is entirely satisfactory.

Mr. Cockley: I have no objection to that, but I just wanted it understood before we did it that I should probably cross examine Mr. Smith on this so-called original cost exhibit and perhaps Mr. Milde would want to cross examine him on the other exhibit. I do not wanted to be limited by the usual rule of one man cross examining; as long as we do it on different exhibits.

If you want to go ahead as a convenience to Mr. Smith and have him testify on direct, I will be glad to have you do it.

The Trial Examiner: What is the particular advantage to Mr. Smith?

Mr. Cockley is present and we are ready for the cross examination with respect to the original cost. I can not see where it will affect Mr. Smith's convenience. He will have to be here for the cross examination, whether it is now or later.

—2757—

* * * * * *

CROSS EXAMINATION by Mr. Cockley.

Q. As I understand, Mr. Smith, so far as Exhibits 57 and 57-A are concerned, you instructed your staff to prepare those in accordance with the Commission's code of accounts as interpreted by you to them. Is that right? A. Yes, sir.

Q. And while you do not assume responsibility for these figures in detail, you believe they have done that? A. That is correct.

—2758—

Q. And I suppose any examination about the detailed figures should be addressed to Mr. Pace or Mr. Dunn, or whoever will appear later? A. Yes.

Q. Is the same statement true with respect to the text appearing in the first part of these exhibits? A. That is right. As far as the detailed figures are concerned, the men who prepared them are responsible. But so far as principles are concerned, I am responsible.

Q. You did review Schedule 1 on page 10 of this Exhibit No. 57, did you? A. Yes, sir; I reviewed it generally.

Q. You reviewed it generally? A. Yes.

—2759—

Q. I will ask you if it is not a fact, Mr. Smith, that the figure appearing in the lower right-hand corner at the bottom of the page, $51,207,000, is not the figure that you find to be the original cost of this property? A. Yes, sir.

Q. And when I say that, Mr. Smith, we are always excluding the distribution system property? A. Yes, sir.

Q. I will ask you if it is not a fact that as developed on that page you started with a cost per books of the whole company of $53,306,000, shown at the bottom of column "D," accept some reclassifications in that which have been made by the company, with the same total amount appearing in column g, and then made some adjustments up and down in accordance with these principles which you announced and arrived at an adjusted book cost of $51,207,000. Isn't that so? A. Yes, sir.

Q. That figure developed there, as this exhibit shows in the title, is the investment in gas plant per books and as adjusted as of December 31, 1938, is it not? A. Yes, sir.

Q. It is an adjusted book cost? A. Yes.

Q. Isn't that so? A. That is right.

—2760—

Q. And I will ask you if the subsequent schedules that appear in Exhibit No. 57 and also in Exhibit No. 57-A are not in their entirety supporting details for this adjusted book cost of $51,207,000? A. Yes; adjusted book cost, meaning that we think that is a proper cost of the property.

Q. It is a cost that you got from the books of the company and adjusted downward to the extent of about two million dollars to arrive at $51,207,000? A. It is the cost that we got from auditing the company's books and records.

Q. But it is just what this exhibit calls it—the investment in gas plant per books? A. Yes, sir.

Q. That is the part of the original investment that was made at the time that was charged on the books of the company to plant account, isn't it? A. That is right.

Q. Now, I want to ask you another question. A. Just a minute, please. I had better explain that. There may be some difference of viewpoint here, and we ought to understand each other.

In all of our work we feel that we are compelled to start with book figures so that the company will know the

—2761—

derivation of every figure in the report. We presume the company knows what is in its books. By starting out with that figure and showing the adjustments we arrive at an adjusted figure.

We have done that in this case. We have shown the cost per books primarily for the convenience of the company in order that it may check thoroughly the stages through which we have gone to reach the final figure. I say the final figure represents what I think ought to appear in the books today as the adjusted book figure.

Q. Is there any doubt but that that figure of $51,207,000 as developed there and as supported by all these schedules, Mr. Smith, is an adjusted book cost? A. If you are attaching any specific weight to that, then I have to make myself clear, that I think the figure is a figure of real substance. It is the only valid original cost figure that I know of.

Q. Will you tell me what it is. As it is developed and supported here it is an adjusted book cost, isn't it? A. I think you are attaching some special meaning to the schedule which I may have to deny. The final figure does not appear on the books, if that is what you mean.

Q. The $53,306,000 appears on the books? A. Yes. That is the first figure, not the final figure.

Q. You adjust that downward by two million dollars

—2762—

or thereabouts and arrive at the adjusted book cost? A. We make adjustments to practically every account, and the effect of it happens to be an adjustment downward; and we get a final figure, which I say represents original cost under the Commission's Uniform System of Accounts.

Q. I did not ask you what you finally called this figure. I am only taking one step at a time. As this is developed here it is an adjusted book cost, as the exhibit shows, isn't it? A. I do not like to take—

Q. Can't you answer that yes or no? A. No; I cannot. It does not appear in the books, if that is what you mean. I don't understand what you mean by "adjusted book cost."

Q. I am only taking the expression that appears on this exhibit, which says "investment in plant account per books and as adjusted." You started with the plant account per books? A. Yes. And we say that that figure is wrong.

Q. You say that that figure is wrong by two million dollars? A. Yes.

Q. And you write it down two million dollars? A. We do not write it down. We make adjustments to show what the answer ought to be.

—2763—

Q. Is the effect of the adjustments to get a figure or a lower figure? A. A lower figure.

Q. And that is what you call here "as adjusted," and that means book cost as adjusted, doesn't it? A. It means more than that. It means it is the bona fide original cost figure.

Q. Does it mean that? A. In one sense, yes. In one sense we start off with a book figure and we make the necessary adjustments to it and arrive at another figure, and in one sense you could call that the book figures as adjusted. But the final figures have a lot of substance to them.

Q. Whether or not they have substance, the figures as developed by the Examiner's adjustment to the plant accounts as they appeared on the company's books, that is as the cost appeared on the company's books? A. That is merely the mechanics.

Q. Whether or not it is the mechanics, that is how it was arrived at, isn't it?

The Trial Examiner: As I understand it, that is the cost as arrived at by the application to the book costs of certain adjustments.

The Witness: Yes, sir.

—2764—

By Mr. Cockley:

Q. I want to refer you to the depreciation exhibit, which has not yet been identified, and ask you to turn to page 23. That is the exhibit that you are going to testify to next as to accounting principles, isn't it? A. I believe it is.

Q. I will ask you if the figure— A. I would just like to correct that slightly. It is more than accounting principles that I am going to testify to next.

Q. All right. I will accept that.

I call your attention to line 55 and note above it which says "net adjusted book cost December 31, 1938."

And opposite that, for the total plant, $51,207,000? A. That is right.

Q. And on page 8 of that exhibit you make a statement to that effect, don't you? A. Yes; I think I do. In the beginning I thought we were together, but you talk about adjusted book cost, which makes me think that we are not.

We use that as a convenient term to show the figures which we have arrived at as a result of auditing the company's books. Actually the final figure is not on the company's books.

Q. Of course, Mr. Smith, we have been over that sev-

—2765—

eral times. It is perfectly obvious from this schedule that the figure on the company's books is $53,306,000? A. That is correct.

Q. And you took some retirements which were not shown and made some other adjustments up and down and come out with the figure of $51,207,000? A. That is correct.

Q. Which was an adjustment of the company's book figures, wasn't it? A. That is right.

Q. Now, I call your attention to schedule 2, page 13 of Exhibit No. 57. That says, does it not, "The capitalized cost per books and as adjusted"? A. Yes.

Q. Is that a different basis? A. No; if is not.

Q. That means the same thing, doesn't it? A. Yes.

Q. What it means is that it is part of the cost appearing on the company's books in capital account? A. I can not go along with you on the word "part."

Q. I will accept that. It is the dollars that the company capitalized in its plant account as the cost at the time, isn't it? A. Yes.

—2766—

Q. That means precisely the same thing, doesn't it? A. Yes.

Q. Does this expression that I see on schedule No. 1, "Investment in gas plant per books" mean the same thing? A. Yes.

Q. At another place on page 4 it says, "Total cost of gas plant in service per company's books." A. The same thing.

Q. That mean the same thing? A. Yes.

Q. And all of them refer to this $51,207,000 that is developed and supported by all of these succeeding exhibits? A. When you use the language "per books," then you relate it to the books.

Q. We understand each other. If it says "related per books" that means the $53,306,000. If it says "per books adjusted" it means the $51,207,000, doesn't it? A. That is correct.

Q. And it is that figure that you also call on the face of this exhibit the original cost of gas plant? A. Yes, sir.

Q. And isn't it a fact, Mr. Smith, that there is not a table or figure anywhere in here that develops and supports that figure of $51,207,000 except Schedule No. 1 which is the summary and the supporting sheets? A. They all sup-

—2767—

port it.

Q. And they support that figure which, in the first instance, is an adjusted book cost which you also say is original cost, in your view? A. Yes. I am sort of sorry we had "adjusted book cost" in view of the apparent interpretation that you place on it. To me it means the original cost.

Q. That is, to you, an original cost of an item of property is whatever the company has recorded at the time on its books? A. No, sir; only in accordance with sound accounting principles.

Q. Omitting accounting errors? A. That is correct.

Q. Omitting accounting errors, it is whatever the company charged on its books at the time cost? Is that right? A. If whatever it charged on the books then was proper, that follows.

Q. In company Exhibit No. 20 it purports to show an original cost of Hope Company's property at December 31, 1938 of close to 70 million dollars, in round figures. A. Yes, sir.

Q. And am I correct, Mr. Smith, that the principal difference between that statement and Exhibit No. 57 relates to only four or five general items? First, and by far the

—2768—

most important, is the direct material and labor costs of various kinds which the company in the past had charged

at the time to operating expenses and had not capitalized. A. I will have to deny it so far as direct material is concerned. I found no evidence on my visits to the company's offices of direct materials. But certainly the big difference represents labor costs in drilling wells. That is by far the largest item.

Q. Is it your statement that if material costs were charged at the time to operating expenses that would be an accounting error which you now restore? A. No; only if it were in connection with replacements which were generally charged to expense my answer is no.

I might say right now we think that Mr. Antonelli, who prepared the exhibit, did not have support for some of the material cost he shows there. But that will be taken up by another witness who is making a check of the matter.

Q. Then you are not going to say that if there are materials appearing in there that they should be there? A. No. You would have to go back to see whether they represented items which were properly charged to maintenance. In other words, if you set out to get all of the possible costs of plant you could get one figure; if you set out to get all of the possible items which could be charged to expense,

—2769—

you would get another figure; but the same items would be in both accounts.

Q. Let's get back to the main differences. You say one of the principal differences is the question of these direct material and labor costs insofar as they involve materials charged to capital account and which your men have not included in capital account? A. Yes.

Q. And the biggest item of that is well drilling cost? A. That is correct.

Q. That is about $12,500,000? A. It is a large item.

Q. And that represents the cost of wells drilled by the Hope Company or by the company from whom the Hope Company purchased them that were at the time not capitalized? A. That is correct.

Q. The second item of any importance was these overheads to which you testified, which at that time were not capitalized? A. Yes, sir.

Q. And those are the two principal items, are they not? A. I believe they are.

The Trial Examiner: At this time, gentlemen, we will

—2770—

take a short recess.

(Thereupon, a short recess was taken, after which the following occurred:)

—2771—

The Trial Examiner: You may proceed with the examination of the witness.

By Mr. Cockley:

Q. Mr. Smith, I direct your attention to schedule No. 1, appearing on page 10 of exhibit 57. I am correct, am I not, in saying that under account 332.1, producing gas well, well construction, you have in there in the adjusted column "J" a little over four million dollars to represent the drilling cost of all of Hope's wells that were in use on December 31, 1938? Is that right? A. Yes; that is right. That is the proper cost of well construction of the wells which were in existence on December 31, 1938.

Q. And Mr. Antonelli has in exhibit 20 an item of about approximately 12½ million dollars higher than that? A. I believe that is correct.

Q. Will you tell me if it is not a fact that this item of four million dollars which you have in there represents the drilling cost of about 700 out of 3,300 wells, Mr. Smith? A. I don't know.

Q. You can't answer that? A. I cannot.

Q. You do know that prior to 1924 or, rather, be-

—2772—

fore 1923, the Hope Company charged those drilling costs to expense and did not capitalize them? A. That is cor-

rect. I would estimate that there is a substantial number of wells which do not carry drilling costs in the plant accounts.

Q. And of the total difference between the figures in exhibit 20 and those in exhibit 57 of something over 18 million dollars, 12½ million dollars is in that one item, isn't it? A. That is right.

Q. Now, Mr. Smith, I want to ask you one or two questions to get straight on this. Assuming that in 1920 the Hope Company drilled a producing gas well and the work order of the Hope Company shows that it properly expended $10,000 for materials and $10,000 for well drilling and other construction costs, on these assumptions and omitting any consideration of overheads for the present, are you agreed that the money actually paid by the company in drilling and equipping these wells was $20,000? A. Yes; I think the money paid was $20,000.

Q. There is no doubt about it? A. There is no doubt. But that does not necessarily mean that it is a valid cost at this date of that well.

Q. We will come to that later. There is no question but that the company originally paid $20,000, and prop-

—2773—

erly paid $20,000 for drilling and equipping that well? A. That is right.

Q. Can you tell me what was the cost of that well to the company? A. The cost of that well at that time might have been, in the assumed case, $20,000. But still that does not shake my principle that the valid original cost is $10,000.

Let me state it this way.

Q. I am not interested in whether it shakes your principles or not. I want to know if you can answer the question. Before any bookkeeping on that well was done the cost of that well to the Hope Company was $20,000, was it? A. Yes. I think I can go that far.

Q. At that time was the original cost of that well $20,000? A. Knowing nothing further, yes.

Q. And the actual legitimate cost was $20,000? A. So far, yes.

Q. There is no doubt about that, is there? A. There is no real doubt any more than that the cost of paint on a building is an actual legitimate cost under the theory that you mention, until you get to the operating and account-

—2774—

ing stage and stage of producing revenues, and then we have a different situation.

Q. Then, what you say is that although the original amount of money paid for this is $20,000 the actual cost and original cost and legitimate cost of that is $20,000; if the company subsequently records only a part of that cost in its plant account, then the $20,000 ceases to be the actual cost or the original cost? Is that correct, Mr. Smith? A. Oh, no. I think that again we are following abstractions and an isolated case. I think when you reach the operating stage and the company treats those things as expenses, they are bona fide expenses. The fact that you put a new inner tube into a tire gives you a new cost of that tire. You deal abstractly with it. The inner tube and tire must be taken. But we are getting away from realities when we do those things and we forget how businessmen run their businesses; you are following an abstraction.

Q. It is not my purpose to argue with you as to why you do this, because this cross examination will be unnecessarily prolonged. If you feel that you must make some explanation of your position and that it requires some defense, of course, you can volunteer those things. But I want a direct answer to my question as to how you treat

—2775—

these things. A. I have an obligation here to give a full answer, too, I believe.

Q. I don't want to preclude you from doing that, Mr. Smith.

Mr. Springer: I object to the characterization of the response of the witness by Mr. Cockley. He is certainly entitled to explain any answer.

Mr. Cockley: Mr. Smith is a very intelligent witness and a capable witness.

The Trial Examiner: Let's proceed with the examination of the witness.

By Mr. Cockley:

Q. Now, let's come to the bookkeeping, Mr. Smith. Suppose the company, in the case that we have assumed, capitalized on its books the whole of that $20,000 for labor and materials and now carries that amount on its books; there would be no doubt in your mind that that would be the book cost and still be the original cost? A. That is correct. And we would not change it.

Q. And you would not change it? A. That is right.

Q. Am I correct in saying that if the whole of this substantially 12½ million dollars in the well construction accounts had been originally capitalized by the company

—2776—

on its books that there would be no question in your mind now but that it would be part of what you term the original cost? A. If we can go one step further and assume that that was the general practice of the industry, certainly we would have no difficulty.

Q. Assuming that it was an acceptable practice? A. Yes. We would have no difficulty. In other words, where there are alternative methods of accounting—and there are alternative methods—and you follow one system, I will accept that scheme, provided you apply it consistently. That is the only way, Mr. Cockley, that you are ever going to have any consistency in the determination of profits or income and determination of cost of plant.

Q. Am I further correct in saying that substantially the whole difference between exhibit 20 and the total

figure at which you arrive here in exhibit 57, if the company had at the time capitalized all of the items which it shows and which you disallowed—if I may use that expression—you would have now included them in original cost? A. No; that is not quite so. We think that Mr. Antonelli in his study has resorted to some arbitrary estimates which we would not allow in any event, because we do not think

—2777—

the items would ever have appeared on the books; but to the extent the items would have appeared in the books, if you had followed one of the alternative methods of accounting, we would have accepted them.

Q. That is applicable to the $19,000,000. That is a relatively minor item. A. It may be a substantial item. Someone else is going to testify to some of the amounts.

Q. If they had been actual expenditures at the time capitalized in the accounts, so that the question of estimates was out of it, you would have allowed a substantial figure? A. That is correct—assuming the entries would have conformed to accepted principles and practices.

Q. You don't mean to say that that has to be the universal practice in the industry? A. No.

Q. And you recognize, do you not, that some gas companies did capitalize these well drilling costs in the past and others did not? A. There were very few of them which capitalized them, so far as I know. We made diligent inquiry and found very few companies; and I don't think we found any that capitalized the items regularly before about 1919, when the Pennsylvania Commission required cap-

—2778—

italization. Overwhelmingly natural gas companies charged those items to expense, and the Commission acted upon them as expense.

Q. That is your assumption, that they acted upon them? A. They had to.

Q. Suppose they did act upon them; what difference does it make? A. All the difference in the world. If you treat something as expense which is treated as expense by the industry and everybody in the industry recognizes it as an expense, and executive decisions are made on those assumptions, you can not go back and undo it or change the rates or the moneys which you collected from the customers, which were based upon the accounting for well drilling expense.

Q. Suppose you have $10,000,000 of well drilling costs; suppose the condition of the well drilling accounts charge is 50 per cent; that would mean that you would have at least $5,000,000 to set up in your rate base on your asset side, wouldn't it? A. I think so. The net amount—actually you set up twice that amount and have the reserve offset it. The net amount would be as you indicate.

Q. If you would figure it at a net basis you would take the depreciated condition of the dollars, whatever

—2779—

dollars you set up for it originally? A. That is correct.

Q. So it would be about $5,000,000? A. That is correct.

Q. And if you allowed 12 per cent to cover both depletion and return on that, you would get in operating expenses about $600,000, roughly, wouldn't you? A. Your return does not get into operating expenses.

Q. Well, it does for the purpose of a rate statement, doesn't it? A. The return is profit. It never gets into the expense. I don't want to have these differences on technical matters.

Q. You are talking as a technical accountant, aren't you? A. Yes.

Q. As a practical man, when you get over into operating expense which you consider for purposes of fixing rates, you get about $600,000 on that, and you would get about $600,000 expense and return. If on the other hand,

instead of having anything in capital account for these items you put over into operating expense about $600,000, your rate would be precisely the same, wouldn't it? A. The rate?

—2780—

Q. Yes; the rate at which you arrived would be precisely the same? A. I don't see that.

Q. The price at which you sell your gas to cover this cost would be precisely the same? A. No; I don't think so.

Q. You think it makes a difference whether $600,000 is the amount of expense or whether $600,000 is the return plus depreciation or depletion it would be expense? Is that your statement? A. I think it makes a big difference as to what you consider expense. I am having difficulty in following your questions. The questions are confusing to me.

Q. I do not mean them to be confusing. Of course, I am not an accountant, and I try to state it simply from the point of view of the effect on rates. Actually in either case you are going to get $600,000 in some form or other? A. No; I don't think so. In the latter case you are going to try to get $600,000; but in the first case if you do not have any expense, you are not trying to recover something for expenses which are not incurred.

Q. Then your statement is that there is a difference between those two situations? A. Yes; I think there is all of the difference in the world—

—2781—

Q. That is sufficient. A. —as to your action based upon what expenses are shown by your income statement.

Q. Let's come back to the bookkeeping. You have already stated, I think, that if in the case we assume, where a company had properly spent $10,000 for equipment and $10,000 for drilling a well if they had capitalized the whole on their books, you would now allow it as a part of the original cost? A. That is correct.

Q. Now, suppose that instead of doing that they capitalized only the material and charged the labor cost to expense, which Hope did prior to 1923; I understand your position to be that you would now consider the original cost of that well and the book cost to be the same, namely, $10,000. A. There is no doubt about it. And I gave an illustration which I would like to repeat.

Q. You have answered the question. A. I want to give this illustration and drive home that point.

Q. Now, just a minute, Mr. Smith, please. I am going to object to these voluntary statements. I am merely trying to ascertain the position of the witness about these things. I submit it is not a matter subject to debate every time I ask a question.

—2782—

If I can not be protected in pursuing the cross examination in my own way to develop facts and not accounting theories, we will never end the cross examination. If Mr. Springer wants to ask further questions when I have finished, of course that is his right.

Mr. Springer: We are dealing with accounting principles. When Mr. Cockley opens the door on an accounting principle by a question, certainly the witness is entitled to explain his answer. That is all he is attempting to do.

The Trial Examiner: I think he is entitled to explain his answer, but it did not seem to me that that last answer required any particular explanation.

Mr. Springer: May we have the last question and answer read, Mr. Examiner?

(The question and answer were then read by the reporter.)

By Mr. Cockley:

Q. That is an illustration.

And Exhibit No. 57 is set up on that basis?

Mr. Springer: Just a minute, please. We have not had a ruling. I think the witness is entitled to explain his answer.

The Trial Examiner: I understood that; but I do not understand that there is any objection pending. There is nothing to be ruled upon.

—2783—

Mr. Springer: No, but he is not given an opportunity.

Mr. Cockley: I object to the witness going into and giving other illustrations.

The Trial Examiner: I think an explanation and an illustration are two entirely different things. If the witness wants to explain his answer, he may do so.

The Witness: What I wanted to do was to point out that in this very case we have a problem of that nature involved in the determination of income, that is delay rentals. In the course of time, I think delay rentals will amount to more than the cost of well drilling which has been charged to expense. And whatever ruling may ultimately be made in regard to the well drilling expenses ought to be made with the full realization that delay rentals are in the same category.

By Mr. Cockley:

Q. Have you finished? A. Yes.

Q. Did I correctly state your position in my last question? A. You did.

Q. Now, Mr. Smith, suppose a company, in accordance with the practice followed by other companies at the time, although not the universal practice or a practice of universal application, had charged both the cost of drilling and

—2784—

equipment to expense; is it your present position that both the book cost and the original cost of that well is zero? A. No.

Q. On that theory, I suppose that would be an accounting error? A. That is correct.

Q. Let me understand you. Did you understand from my assumption that I assumed that that was the practice that was followed by many companies at the time? A. That would not have conformed to accepted principles of accounting. If you assume that it did conform to accepted principles of accounting, I would go along with you. But it did not conform to accepted principles of accounting.

Q. But if it had conformed to accepted principles of accounting, by which you mean a principle which was applied with some degree of generality— A. And which certified public accountants would certify to unhesitatingly. There is one qualification we must make. We are dealing solely with original costs. You will recall I testified if something were charged to expense in error and it were recovered from the rate payer, as a regulatory measure I doubt that you should recover that cost again, regardless

—2785—

of the fact that the error was made. That error would not bind me as far as getting original cost in the accounting sense is concerned.

Q. You did not make any investigation to determine whether any of these costs were recovered from the rate payer, did you? A. I had an idea they were all pretty generally recovered.

Q. That is based on your general assumption? A. No, on the assumption that this company has been very profitable during its existence.

Q. Am I right, Mr. Smith, that it is only true that you could be said to recover the things from a rate payer in the event that your rates would have been fixed at a higher rate if you had expensed these items than if you had capitalized them? Is that right? A. Yes. It goes one step further; by reason of the fact that you have treated this cost as expense and all others treated it as expense, naturally these costs were considered by management as expense in fixing rates.

—2786—

Q. Well, you didn't, in your investigation, go any further, did you, than to ascertain the fact that these drilling costs and some other items that you have eliminated, were recorded on the Hope Company's books as expenses? A. Oh, yes, we went farther than that. First of all, you left out one essential element. We determined that they were charged as expenses in accordance with sound principles and practices of accounting. As a matter of fact, we added to your plant accounts about $1,400,000 which we felt had been charged off in error, and when you say that we have reduced the plant accounts some $2,000,000, actually we have increased the plant accounts.

You yourself made an adjustment recording unrecorded retirements. When you make allowance for adjustments, we have increased the plant account by about $1,400,000.

Q. What I meant was, Mr. Smith, you did not investigate the basis on which the company's rates had been fixed at any time in the past, or whether those rates would have been higher or lower if, in the past, it had capitalized well drilling costs instead of expenses, did you? A. We made a study of earnings with that purpose in mind.

Q. Well, general earnings, you mean, of the company? A. That is right.

Q. Well, I am asking you specifically if you made any

—2787—

study to determine where the company would have come out if it had capitalized these well drilling costs instead of expensing them, and whether it would have larger or smaller amounts? A. Yes, I made some study of that. I found that your company, for instance, claimed some of those items as expenses, the Clarksburg Company claimed them as expenses, at least, before the West Virginia Commission, and they were allowed as expenses. I found other commissions allowed them as expenses.

Q. Well, now, let's see. Our company claimed them in a case before the West Virginia Public Service Commission decided in 1921, wasn't it? A. I believe it was.

Q. And isn't it a fact that that rate case affected only 4 percent of the company's total volume of business? A. I don't know, that is of no consequence to me, however—

Q. (Interposing) Isn't it a further fact that it affected only the domestic consumers in West Virginia, whose rates here aren't under consideration? A. There is no difference in principle, Mr. Cockley—

Q. (Interposing) And isn't it a fact that in that same case, if the company had presented its evidence on the basis of a capitalization of drilling costs, with appropriate allowances for return and depletion on those costs, it would have had just as high a rate as was allowed it? Did you

—2788—

investigate that? A. I don't know what it would have been, if you had done something else. I do know you claimed them as expenses, and they were allowed as expenses, and others did the same thing.

I do know that the items we have mentioned were generally considered as expenses, at that time, and I repeat that I think regulatory commissions are responsible for the change.

Q. Now isn't it a fact that both times that the Ohio Commission, in 1932 and 1937, had the question of the Hope's East Ohio rates before it, that well drilling costs were capitalized and were not in any sense expensed?

Mr. Springer: I object to the testimony of Mr. Cockley. There isn't any evidence in this case of the practice in those other cases that he has presented.

Trial Examiner: Well, I understood this witness to testify that he had certain information on which he was basing his opinion, and that information consisted of these rate cases; is that correct?

The Witness: Yes, sir.

Mr. Springer: Well, in each one of Mr. Cockley's ques tions, he testifies to information that I doubt this witnes would have the details of to determine the accuracy of—

Mr. Cockley: (Interposing) Well, the witness can per fectly well answer. I said, "isn't it a fact"—and if h

—2789—

doesn't know whether it is a fact, he can say so.

Mr. Springer: Make them assumptions, and I will g along with you.

Mr. Cockley: I don't make assumptions—

The Witness: (Interposing) What were the years, Mr Cockley?

By Mr. Cockley:

Q. Well, in the 1932 Akron case, and the 1937 Cleve land case. A. Well, I think that is correct.

Mr. Reeder: Just a n ute, Mr. Examiner. I want t move to strike that question and answer unless counsel wil say, capitalized by whom. If he wants to say it wa capitalized by anybody in particular, I want to ask for strict proof.

Mr. Cockley: Well, I have asked the question and i has been answered.

Mr. Reeder: I am pressing my motion to strike, be cause it is my recollection that in 1931, in the Clevelan case, the Ohio Commission didn't find a valuation of th Hope property, and I have heard Mr. Cockley say that ove and over again—

Mr. Cockley: (Interposing) That is right, and if yo had listened to my question, instead of objecting, you woul have noted that I said in the 1932 Akron case, and in th 1937 Cleveland case that it was capitalized by the Commis sion; is that not the fact, Mr. Smith?

—2790—

The Witness: Mr. Cockley, I made inquiry from th Chief Accountant of the Public Service Commission of Ohi

regarding that matter a year or two ago, and the information he gives me corroborates your statement. That is the extent of my knowledge.

Trial Examiner: The objection is overruled.

Mr. Reeder: I withdraw it, I am sorry, I didn't hear it on account of the noise.

By Mr. Cockley:

Q. Now those cases before the Ohio Commission, to which I have just referred, are the only times within your knowledge, are they not, when the export rates of the Hope Company had been under consideration by any regulatory body until this present case? A. I have no knowledge of any other case.

Q. Mr. Smith, getting back to these well drilling costs and how they are charged on the books, as I understand your testimony, if there were two companies, each of which drilled a well at a cost of $10,000 for construction and $10,000 for equipment, and one company capitalized that all in its books and the other charged the well drilling to expense, and those companies came here before you to set up their accounts in accordance with the Uniform System of Accounts, one of them would have the well in at $20,000, and the other would have it in at $10,000, is that not so? A.

—2791—

That is true, but that is not unusual, Mr. Cockley. I have got to make myself clear on that—

Q. (Interposing) Do you think that answer needs some explanation? A. I think it does. There is an implication there that that would be a wrong situation, and it would be a perfectly valid situation. I think I ought to be given the opportunity to explain it.

Q. Well, if you think your position, standing alone, requires explanation, go ahead and explain it. A. Well, it does.

Q. I haven't asked you for an explanation, have I? A. No.

Q. You are volunteering it? A. Yes.

Trial Examiner: Have you completed your answer now, Mr. Smith?

The Witness: It is not the kind of answer that I would like to stand by itself. I think someone reading it may be misled.

Trial Examiner: Go ahead with your explanation.

Mr. Cockley: Go ahead and explain it.

The Witness: Today, when an electric utility replaces a cross-arm, some utilities treat that as a maintenance item, and some treat it as—

—2792—

Mr. Cockley: (Interposing) I object to accounting for electric utilities now. We are talking about a plain, simple question of drilling costs of natural gas wells.

Mr. Springer: We have had testimony that the principles of accounting are the same for all utilities.

Mr. Cockley: Well, we shouldn't have had.

Trial Examiner: Well, it seems to me--

Mr. Cockley: (Interposing) If the witness wants to explain this particular question, I have given him the opportunity to do it.

Trial Examiner: Could you use some item used in the gas industry instead of a cross-arm, for instance?

Mr. Cockley: Use this item.

The Witness: I will use a pipe. A company can take each unit of pipe as an item of property, and every time it replaces a length it can put it through its plant accounts; or it can charge it to expense. Over the course of years you are going to get a different answer for those two companies.

The point I make is that you will always have different answers for any two companies.

I know from my experience that any two utilities, any two department stores or businesses of any kind, with plants, will have different results when it comes to their plant costs applying to exactly the same items.

Mr. Cockley: I move we strike out the discussion about

—2793—

department stores; I think that is entirely too far afield.

Trial Examiner: We are discussing accounting principles, and I can't see that it makes any particular difference.

By Mr. Cockley:

Q. Well, it is a fact, isn't it, Mr. Smith, regardless of the reasons for it, that your position is, and your interpretation of the Uniform System of Accounts, and your method of determining original cost, is that you would freeze the accounting practices of the company, if they were not due to error, in their statement of plant accounts to be filed with this Commission? A. Absolutely, because I think their accounts have been kept correctly. Otherwise—

Q. (Interposing) And then if one company did it one way, and another company did it another way, and on some other feature the same thing was true, you would preserve in those plant accounts, for those various companies, the elections—if you want to call them that—which they had made between accounting practices, and all the variations in accounting practices that they had followed over the years, would you not? A. Assuming that the practices were in accordance with accepted principles of accounting.

Q. I am talking about nothing else. A. Absolutely, I most assuredly would insist upon it, and, Mr. Cockley, just

—2794—

imagine the position this Commission would be in if it didn't insist upon it.

Today your company is not following the same practice as all other natural gas companies. A few years from now this very company could come in and do the same thing over again. You have got to have a finality to this accounting sometime or other.

Q. Isn't it a fact that if the book costs of these companies, or of A Company were set up in accordance with its accounting practices—assuming always that there was no, what you call, accounting error—and B Company were set up in accordance with its accounting practices; and C Company were set up in accordance with its accounting practices—you would have no uniformity whatever in a statement of plant accounts for those three companies? A. Oh, yes, you would have a uniformity, but it wouldn't be absolute or a precise uniformity, and I don't think it is humanly possible to get precise uniformity. That is one of the real reasons why, once you account for something in accordance with a principle, that you ought to abide by it.

Q. Your interpretation of this Code of Accounts is,—this so-called Uniform System of Accounts,—that it was intended to require gas companies to preserve the accounting methods that they had pursued from the beginning of time, so long as there wasn't any accounting error? A.

That is correct, and that has been my practice for 20 years.

Q. Well, you mean that that has been your interpretation? A. I mean that I have audited oil companies 20 years ago, which charged well drilling to expense, and I found it was a generally accepted practice and made no change in it. I still think I was absolutely right in doing so.

Q. Now, Mr. Smith, I want to ask you one other question. Suppose two companies, such as we have assumed, drilled two wells, or each drilled a well, with a total labor and material cost of $20,000.

One of them put it in its plant account at $10,000, and the other put it in at $30,000. Now in each case $10,000 of that would be the book cost, wouldn't it? A. Will you read that?

Q. Well, it is simply a case of two companies each spending $20,000 to drill and equip a well,—one of them

charges it on its books at $10,000, and the other at $30,000. A. I can't see why one would charge it at $30,000?

Q. Well, they might have had a re-appraisal. A. Of course, that would be most unsound accounting.

Q. Well, do you mean to say that there is never inflation that gets into these costs at all? A. Not if I can help it, there won't be any inflation.

Q. Before you came into the picture? A. I think com-

—2796—

missions, since they started regulating accounting—and one of the first jobs a commission undertakes when it gets organized is to regulate accounting—generally have tried to keep inflation out of the accounts.

Q. If it will make you feel any better, suppose we say that one company sells their well, which cost it $20,000—it is a utility, and it sells this well to another company for $30,000. It would then be $30,000 on the books of the accounting company, wouldn't it? A. There is no affiliation between the companies?

Q. No affiliation. A. That is correct.

Q. It is a good well, it is honestly worth $30,000. A. O. K.

Q. Now you would set that up in your plant accounts as $20,000, wouldn't you, and show the $10,000 additional in account 107? A. No, sir, we would show it as $30,000. An individual well is not an operating unit or system.

Q. Well, I assumed that it was. I want to take the assumption where it is an operating unit or system. A. Then you have got to get a business with customers attached, and a going business, and when you buy a going business, you can't tell how much you pay for the well. That is exactly why we have this original cost provision in

—2797—

the System of Accounts.

Q. All right. Suppose it is a case where one utility sells to another what you would call an operating unit, and

the purchasing utility puts it on its books at $10,000 or $100,000, whatever it has paid, above the cost of the selling utility? A. Yes, sir.

Q. Am I not right that you show, in your adjustment account—100.5—the amount that is paid over and above the cost to the selling utility, is that not so? A. That is correct.

Q. As shown by its books? A. That is correct.

Q. And if there were a re-appraisal which appeared on the accounts at any time, of a given item, you would show that in some plant adjustment account, would you not? A. If the appraisal figure on the books of the selling company were less than the cost to the purchaser, all the excess would go into account 100.5, but if the purchaser put on an appraisal figure higher than cost, then the excess would go into the account 107.

Q. And if that were done, the write-up, or the inflation, whatever it is, would not disappear from the company's accounts, would it? A. Oh, yes, it would disappear

—2798—

eventually, because both account 100.5 and account 107 provide that the amounts included therein "shall be disposed of as the Commission may approve or direct."

Q. But the information would be shown by the accountants for the benefit of the Commission, and the Commission would decide what ought to be done with it, would they not? A. Yes, the Company still having a right to petition the Commission for disposal in accordance with its wishes.

Q. But you believe that that is a proper method of accounting for the accountants to show the facts as to the amount of the inflation, if there is any, and that the Commission disposes of it as it sees fit? A. I will go one step farther,—I think if it is real inflation, the Commission ought to order it charged off at once.

Q. Regardless of what your views are as to what the Commission ought to do, you think it is an accountant's duty to show any overstatement of costs, isn't that so? A. I will go farther than that. I don't think the accountant has any right to sign his name to a statement containing inflation.

Q. Well, are we agreed as to what inflation means? Do you call it inflation if a company legitimately has paid more than the cost for the acquisition of property? A. No, sir.

—2799—

Q. Well, then, call it just an overstatement, and assume it is a mere overstatement? A. Just payment in excess of original cost.

Q. And the Commission will be advised by the accountants of all the facts, the amount of the increase over original cost, will it not, and the Commission could dispose of it as it saw fit? A. It would, indeed. We would go farther, we would try to show to what it relates, if we can possibly do it—

Q. (Interposing) And you believe it is an accountant's duty to bring out all those facts, and that that is one of the purposes of the new System of Accounts? A. That is right.

Q. But it is your interpretation of that System of Accounts that it applies only to overstatements and does not apply to any understatements of original cost, is that right? A. That is absolutely not so. Account 100.5 may contain a credit figure as well as a debit figure.

Q. But Account 107 would never show any difference on your interpretation, between the actual money paid by the company in the construction of property, and the book cost of that, would it? A. Well, it would show other things. Account 107 will show chiefly write-ups. It will also show unrecorded retirements when we find them, until the time comes when the entries are made correcting the

—2800—

adjustments. Sometimes we find that a discount on common stock is charged to the plant accounts. That discount does not belong in the plant accounts at all, and we show that in Account 107. Generally speaking, however, Account 107 is designed to include any amounts of inflation in the company's accounts.

Q. But not to show understatement? A. Not 107.

Q. Well, this says, "This account shall include the difference between the original cost, estimated if not known, and the book cost of gas plant, at the effective date of this System of Accounts, to the extent that such difference is not properly includable in Account 100.5, Gas Plant Acquisition Adjustments."

Now am I right that it is your construction of that, and you have so advised your examiners, that if the money actually paid by the company in the acquisition of property, actually paid by the company in the construction of property, is higher than the cost as recorded on its plant accounts, the difference shall not be shown in Account 107? A. Again, we are assuming that the costs were accounted for in accordance with accepted principles?

Q. That is right. A. It does not go in 107.

Q. Well, "accepted principles" as we have discussed

—2801—

them before—I mean they followed the practice of other companies which was recognized as not an improper practice at the time? A. Well, if you speak of the well drilling costs in this case, we have a specific example; those well drilling costs should not be restated with the offsetting credit in Account 107.

Q. In other words, in that case you do not show the Commission the difference between the money actually paid for the construction of the property in the first instance, and the book cost? A. Mr. Cockley, we do not, we can never show the Commission pure cost in some abstract

fashion, forgetting how those costs have been accounted for. The Commission knows in this case that these items have been charged to expense, and if it had not been brought out already, we would make it clear to the Commission that they had been charged to the expense.

The items have been brought out, but in addition we intend to file a reconciliation statement showing exactly how those items have been accounted for. So in this case, at least, we will give the Commission all the information.

Q. Have you finished? A. Yes, sir.

Q. Mr. Smith, will you tell me what is theoretical and impracticable about going back to the original work orders

—2802—

of a company which show in detail the dollars it has spent for equipment and for construction costs of a well, and setting up those dollars as the amount of money actually paid for the construction of that property? A. Can't we eliminate the item of equipment from your question?

Q. Well, work orders show both, don't they? A. Yes, but only the costs of drilling were charged to expense.

Q. That is right. A. I would say that we would be absolutely wrong to take those drilling costs which were charged to expense and put them in a statement and say to the Commission, "This is our understanding of the original cost of this property." We have got to get down to realities and actualities in this thing. Things which are charged to expenses, and are properly expenses, I would never put into plant accounts.

Q. I object to the lecture, it isn't necessary. I am just asking you what is impracticable about determining the cost as shown by the work orders of the company, and the records of the company, and what is theoretical about it. A. Well, it is wrong. As far as being practical, you could do it or you can make a statement of any kind of figures you want, but it would be wrong to do it.

Q. Do you think it would be wrong to tell the Com-

—2803—

mission in a rate case how much money the company actually and properly spent in the construction of property now in service, whether it was charged to expense or capital account, or where it was charged, or whether it wasn't charged at all? A. No, Mr. Cockley, it would not be wrong to tell the Commission that. It would be wrong for us to bring an original cost statement in, in which were included those items and overheads previously charged to expense, and to say to the Commission, "We think this is the original cost," when we do not think that.

Q. Will you answer my question?

Mr. Reeder: I object unless the witness has had a chance to finish. I think he ought to have a chance to finish.

Trial Examiner: Go ahead and finish your answer.

The Witness: I think I have finished.

Mr. Cockley: I move to strike the answer as non-responsive.

Trial Examiner: I can't agree with you; it seems to me that the answer was responsive to the question. Read the question, please.

(The question was repeated by the reporter.)

By Mr. Cockley:

Q. Well, you agreed at the beginning, didn't you, Mr. Smith, with me that if a company had properly spent $10,000 for well equipment, and $10,000 for labor for constructing a single well, and if you didn't know anything

—2804—

about the bookkeeping, that the original cost of that well was $20,000? A. At that time, yes.

Q. And you think that your interpretation of the uniform code of accounts is that you do not need to show all of these costs shown by the company's records to have been expended for the construction of the property, all of these drilling costs for the construction of some 2600 wells, not

a one of which appears in your exhibit? A. I don't think we ought to show them as part of the plant cost.

Q. Well, as I say, you think your code of accounts precludes you from doing that? A. I am sure of it.

Q. You are absolutely positive about it, are you? A. Yes, I am positive about it.

Q. And that has been your consistent interpretation of it, hasn't it? A. Yes, and it has been my practice in determining original cost.

Q. And that is based on paragraph 2(b) which you read this morning, isn't it? A. Yes, and much more than that. The auditors who audited the Standard Oil Company and the Hope Company,—Price, Waterhouse—didn't find any fault with the fact that these things were charged to expense, it was a sound principle.

—2805—

Q. Were those auditors determining original cost? A. They were certifying to financial statements which showed cost.

—2806—

Q. Were they testifying in any respect to the statement of cost contained in this definition of accounts, which means the amount of money actually paid for property or services, or the cash value at the time of the transaction of any consideration other than money? A. Yes, indeed, that is exactly what "cost" means, and they were required, under the rules of the Securities & Exchange Commission to conform to a general principle of that nature, or to qualify their statement.

Q. And when it applies to original cost it means that cost to the first company devoting the property to public service? A. Now you are talking about something else.

Q. I see; all right.

Now isn't it a fact, Mr. Smith, that, except for some general overheads charged after 1923, none of the expenditures made by the company in excess of book costs, and here

in question between us, were charged to expense in accordance with any uniform system of accounts in effect at the time? A. As far as I know that is true.

Q. Isn't it a further fact that they were not so charged in accordance with the discretion of the management as exercised under such uniform system of accounts? A. That is true. Mr. Cockley, upon reflection I would like to say that the items were charged to expense under the discretion of management, but not under a uniform system of

—2807—

accounts.

Q. Well, I just read you the phrase as it appears in Instruction 2(B) which you read. A. That is right.

Q. Instruction 2(B) says:

> "It is likewise . . intended that adjustments shall be made to record in gas plant accounts amounts previously charged to operating expenses in accordance with the uniform system of accounts in effect at the time or in accordance with the discretion of management as exercised under such uniform system of accounts."

A. I want to make it clear too, that, as I testified this morning, that was put in to show that nothing in the system of accounts changed the general rule. We were afraid someone would construe the system of accounts as authority for doing that thing, and we wanted to show that that was not so.

Q. Isn't it true that there are other accountants and auditors, who had something to do with the determination of that final form of the system of accounts, who take a slightly different view of the purpose of this than you do? A. I don't know about individual auditors, I know that the Committee on Statistics and Accounts of the National Association takes the same view that I have. Officially, its view is the same.

Q. Well, the Pennsylvania Commission hasn't inter-

—2808—

prefed it that way, have they? A. As far as I know they have. In my last conversation with a representative of the Pennsylvania Commission he stated that he did not think that items previously charged to expense in accordance with the established principles of accounting at the time, should be restated.

Q. Well, that Committee interpretation that you just referred to is one that you had a pretty large hand in writing, isn't it? A. It was written originally by the chairman of the committee. I toned it down somewhat; it went farther than I wanted to go. I edited it and revised it, but it was written originally by the chairman of the committee.

Q. But it wasn't adopted at any time by the Association, was it? A. No, by the committee; the Association authorized the committee to send it out under its own name, the Executive Committee of the Association did that.

Q. They all do that, don't they? A. No, this was special. The Executive Committee of the Association at a formal meeting authorized the committee to send out that document.

Q. Well, they didn't approve it? A. The National Association doesn't approve any committee reports as such, as I understand it.

—2809—

Q. Well, they accepted it as the Committee filed it, and authorized them to send it out; isn't that what happened? A. That is correct.

Q. And was there any effort made to have them adopt it? A. No, sir.

Q. None to your knowledge? A. None to my knowledge. I think it would be unusual to have them adopt a report of that kind.

Q. All right. I want to ask you just one or two more questions.

It is a fact, is it not, that in the company's income statements for the test years as set up here, it has not included any well drilling costs in those annual expenses? A. That is correct.

Q. It has not included any construction overheads in those annual expenses? A. Well, it has included overheads in expenses; it has, for some of the years, prorated some of the overheads to construction.

Q. Well, it has eliminated, has it not, the amount of overheads prorated to construction, from its annual statements? A. That is right.

Q. The expense statements? A. That is correct.

Q. And so far as the annual statement of the com-

—2810—

pany's income is concerned, under its rates, its operating statement, let us say, and the rate base it offers, it has been entirely consistent as between the two, has it not, so far as you now know? A. Yes, in a way it is consistent. Ours is consistent too, but the consistency is in different respects. Ours is consistent with past practice.

What you have done is restated the plant cost and restated your income of recent years to be on a consistent basis under the capitalization theory.

Along that line I intended to make a statement—I intended to make it later but I might make it now. I don't know whether you folks intend to continue your present method of capitalizing overheads or not, I don't think your method is a particularly good one, I don't like it at all—

Q. (Interposing): I am interested in this, but I submit that it has no part in this rate case. A. Yes, it does, a very vital part.

Q. All right, go ahead. A. If you intend to change that method of allocating overheads for the future—and I think you may want to change it—I think, before this case is over, you ought to say so, so that proper recognition can be given to the change. If you are not going to capitalize

these overheads in the future, the items now included in overheads should be considered as expenses in prognosti-

—2811—

cating the expenses of the future. It is only in simple justice to you that I make that statement. I think you will want to change it some time, to be frank with you.

Q. I appreciate your comments, but you understand that we are not yet applying to the Commission for permission to set up our accounts in connection with the Code of Accounts, that we are just trying a rate case now. A. Well, I think your rate case and the way you keep your books, have got to be tied together. I think this business of keeping books in one way, and having extraneous figures or different figures in a rate case, is a horrible thing, and I can't condemn it too strongly.

Q. In other words, so far as you are concerned a rate case is just a question of accounting? A. No, I think you have an obligation to keep books right, and that those figures ought to have a real substantial meaning for rate case purposes.

Mr. Cockley: I move that that be stricken out; that certainly is not responsive to any question put to the witness.

Trial Examiner: Read the question, please.

(Whereupon the reporter read the pending question.)

Mr. Cockley: Now, I move to strike that answer as not responsive, and ask the witness to be directed to answer the question.

Trial Examiner: The motion is overruled. It seems to

—2812—

me that he has answered the question.

By Mr. Cockley:

Q. Well now, to get back to another question that I think is not controversial.

As a matter of fact, Mr. Smith, am I correct that ther isn't very much difference between you, in your Exhibit 5 and the Company's Exhibit 20, as to the ultimate fact namely, how much money was originally spent by the Com pany on these various accounts, how it was treated on th books as a matter of fact, and the whole question is whethe or not it is proper to include it in a statement of origina cost in a rate case; isn't that really it? A. That is substan tially correct.

Q. And am I further correct—would you admit this— that if the company's plant accounts were now to be state on the assumption that its books had always been kept i accordance with the present Uniform System of Account from the beginning, that Mr. Antonelli's statement o original cost would be substantially correct? A. Ther would be several million dollars of adjustments, but most o the $17,000,000 adjustment we are talking about would b added to the plant accounts. As an offset to that we woul naturally show a much higher depreciation reserve than w do show in one of our exhibits.

Q. Of course if we are talking about the original cos

of the property, the depreciation would not have to be re flected in it. A. That is right.

Q. But aside from a couple of million dollars, you thin perhaps his statement would be a correct statement of tha original cost if the books had been kept in accordance wit the present uniform system of accounts? A. That is cor rect. I still, for instance, have a good deal of qualificatio on overheads. I think the overheads were computed in pretty ready manner, and getting over-all relationships which I don't have any faith in myself.

Q. Well, the net result of it might be that you migh adjust that two or three million dollars downward—per haps a million or less? A. It would be several million dol lars, but the bulk of the $17,000,000 would be put into plan accounts.

Q. You wouldn't throw all the overheads out, you would recognize the propriety of whatever overheads had been charged? A. I don't know how in the world you could go back and establish it; I would rather Mr. Antonelli have that burden, than that I have it.

Q. I think you have already stated that the company has been consistent in its operating statements and in its rate base statements? A. That is true. I made an explanation at the time and I want my explanation to cover

—2814—

my present answer.

Q. Mr. Smith, the only other question I want to ask you is this—do you claim that the figure of $51,200,000 which you have arrived at, or which your staff has arrived at in Exhibit 57, is any evidence of the value of the Hope Company's plant devoted to public service at the present time? A. To the extent that valid cost to the company is an element of value, that is an element.

Q. Now is it evidence, on your theory, as to the value of all of the property devoted to public service on December 31, 1938, or only that part of the property that is shown in your exhibit? A. It is evidence, it is the real evidence of value of all the property except the distribution property.

Q. Of all the property? A. Yes, sir.

Q. Including the 2600 wells, the drilling costs of which are omitted? A. Absolutely.

Q. And including any physical property or other construction costs that have been omitted? A. As to physical property I don't think we have excluded anything except that which is normally charged to maintenance, and I certainly would exclude that.

Q. As a matter of fact you said you weren't familiar

—2815—

with the details of it and that I should ask someone else about it, but you have excluded some 9500 telephone poles with cross-arms, brackets and pins; and you have excluded

some 275 small buildings that were in there, and so on? A. I don't think we have, Mr. Cockley, but someone else can cover the details of that.

Q. But your view is that it is some evidence of the original cost and therefore some evidence of present value of all the property, and not merely of that part of the property that is included? A. That is right.

Q. And as of what date do you think this is evidence of value? A. As of December 31, 1938.

Q. You recognize, do you not, that you have in here costs incurred from the period 1898 down to 1938? A. That is correct.

Q. Forty years? A. That is correct.

Q. You recognize, do you not, that the price levels in that period have substantially changed? A. Yes, I recognize that; I recognize many other things also.

Q. And you recognize that the price level that prevailed prior to the first World War is about half the price

—2816—

level that has prevailed since that? A. No, I don't recognize that. I think we had better get a graph of prices if we are going into that. After the depression you know we went back I believe to the 1913 levels, so far as general prices are concerned.

Q. Do you really believe that as to the items that enter into the cost of a natural gas plant, do you think we went back to the 1913 levels in labor costs? A. I think that the gross cost, the original cost of these properties, was far higher than any conception of value as of 1938 on a strictly value basis, because the inexorable law operating is depreciation and depletion, there can be no question about that.

These properties, like all physical properties, are on the irresistible march to the junk heap. All physical property is in the same category. As they get older, depreciation occurs, and as you use up the gas, depletion occurs.

Those are the things, I think, which are of primary importance.

Q. Well, you started with this original cost and then you have taken all that off, haven't you? A. I think it ought to be taken off.

Q. Well, I understand— A. (Interposing): But were we talking about original cost only, in your question.

Q. Well, now, Mr. Smith, what I asked you was

—2817—

whether or not you believed that the labor prices prevailing in 1931 and 1932 were as low or lower, the ones entering into construction of a natural gas plant, than they were in 1913?

Mr. Springer: We don't have any evidence in this case on the trend, on the variation in labor prices, and if it weren't for the fact that this is in a field in which Mr. Smith has taken a great interest and a hobby, I would object; but I would be glad to have him answer it.

By Mr. Cockley:

Q. Just answer the one question? A. You can't answer the question categorically, Mr. Cockley, for this reason, that while the hourly rate of labor has gone up, the efficiency has improved, and I don't know whether the real wage, that is the real cost, has gone up or gone down. In some industries it has gone up and in some it has gone down. I don't know enough about the natural gas industry at this stage to say, other than that I have made some tests and I find that there has been a substantial increase in the labor efficiency in the case of the Hope Natural Gas Company.

Q. Is it your testimony that a laborer in West Virginia in 1932 or during the depression, or at any time since, could dig as many yards of dirt out of the ground as one in 1913? A. He could dig more. Let's change the date of 1913, take the period 1900 to 1913, and he would dig more in 1932.

—2818—

Mr. Cockley: That is all.

Trial Examiner: Does counsel for the City of Cleveland have any questions?

Mr. Reeder: No questions.

Trial Examiner: The City of Toledo?

Mr. Nathanson: No questions.

Trial Examiner: The Pennsylvania Commission?

Mr. Keenan: No questions.

Trial Examiner: The West Virginia Commission?

Mr. Goldsmith: No questions.

Trial Examiner: Is there any re-direct examination?

Mr. Springer: Yes.

RE-DIRECT EXAMINATION by Mr. Springer.

Q. If the management makes elections, Mr. Smith, under acceptable accounting principles, and expenses an item, should it later be permitted to capitalize that same item retroactively? A. No, sir.

Q. If such permission were granted, would there be any integrity to accounting? A. There would not be, in my opinion.

Q. If such permission were granted, could it not be possible that with every change of management there would be a retroactive revision of accounts?

Mr. Cockley: I object to that; there is no question

—2819—

here about changing accounting. I object to further questions based on the assumption that there is.

Mr. Springer: That happens to be the conflict here, on principles of accounting.

Mr. Cockley: No, it isn't, it is just your conception of it. We are not here asking for permission to change our accounts in any respect.

Mr. Springer: Only to capitalize $17,000,000 that were not formerly capitalized by the election of management under acceptable principles of accounting.

Mr. Cockley: We are not asking to do any such thing. All we did in the exhibit was to show the dollars we spent in drilling the 2600 wells, in addition to the 700 that were on our books.

Trial Examiner: I think I understand the position of counsel. Counsel for the company, of course, claims it is not in issue; and counsel for the Federal Power Commission claims that it is. Well, that makes it in issue, as far as I am concerned. The objection is overruled.

Mr. Springer: Will you please read the question?

(Whereupon the pending question was read by the reporter.)

The Witness: That would be perfectly possible.

By Mr. Springer:

Q. And would it be proper? A. It would not be proper.

—2820—

Q. Mr. Smith, is there a relation between the plant accounts and the income statement? A. There is a direct relationship.

Q. They are inseparable, aren't they? A. They are indeed.

Q. And you would get a distorted picture if you looked at only plant accounts without also considering the related income statement, that is, the treatment of income and expense, isn't that so? A. That is correct.

Q. If the company were permitted to capitalize retroactively items which it had formerly expensed, in a rate case, would not multiple charges against the consumers result?

Mr. Cockley: I object to that; it is just going over the same old ground again.

Mr. Springer: This is new ground.

Mr. Cockley: Oh, no, it isn't.

Trial Examiner: Why wasn't it gone into to begin with, on direct examination?

Mr. Springer: Mr. Cockley opened this up on cross examination, Mr. Examiner.

Mr. Cockley: No, I did[redacted]ss volunteered a statement.

Mr. Springer: It will on[redacted]ake me two more questions, Mr. Examiner.

—2821—

Mr. Cockley: Well, the question is just improper, whether it takes two more questions only, or not.

Trial Examiner: The objection is overruled; proceed.

The Witness: It would be purely a question of fact. If they are allowed as expenses and then put in plant and allowed again, of course there is duplication.

By Mr. Springer:

Q. There would be a return on the former items that were expensed if they were put into plant, isn't that so? A. Obviously if they are allowed both places, there is duplication.

Q. And in addition to that return on a capitalized former expense item, there would be an additional expense for depreciation, would there not? A. That is correct.

Q. Which makes three times the consumer pays for—

Mr. Cockley (Interposing): I object to that.

By Mr. Springer:

Q. In your definition of original cost, in your discussion of the principles of accounting, I believe you concluded that your idea of original cost is the same for accounting and for rate making purposes? A. That is correct.

Mr. Springer: That is all.

Trial Examiner: Is there any re-cross examination?

—2822—

Mr. Cockley: Yes.

RE-CROSS EXAMINATION by Mr. Cockley.

Q. When you were answering Mr. Springer you said that if items were allowed as operating expense, they shouldn't be subsequently capitalized. Do you mean "allowed" as a matter of making rates, or as a matter of bookkeeping for the company? A. I tried to make it clear that if they were allowed both places there would be duplication. If they are not allowed, regardless of how they are accounted for, there may not be duplication.

Q. You mean allowed in fixing rates? A. Yes, sir. I mean to say that if you allowed an item as expense in fixing rates, and later that is allowed as capital plant, on which a return and depreciation is allowed, there is duplication, it is obvious duplication.

Q. And you are confining your answer now to fixing rates? A. Yes, sir.

Mr. Cockley: That is all.

RE-DIRECT EXAMINATION by Mr. Springer.

Q. Well, you aren't confining your answer to fixing rates by a regulatory body, are you; I mean the management itself fixes rates, and has many times, before regulation—

Mr. Cockley (Interposing): I object to this argument

—2823—

with the witness; he isn't asking a question.

The Witness: I think that is the substance of my testimony this morning.

Mr. Cockley: After we have examined today's transcript we may have a few more questions of Mr. Smith, I don't know, but I would like to reserve that right if it proves necessary.

Trial Examiner: I presume there is no objection t that, is there?

Mr. Springer: No.

Trial Examiner: The hearing is recessed, to reconven tomorrow morning at 9:30 in the Commission's Hearin Room on the second floor of 1757 K Street, N. W., Wash ington, D. C.

(Whereupon, at 4:45 p. m., the hearing was recesse until 10 a. m., Wednesday, April 23, 1941.)

## 10. TESTIMONY OF COMMISSION WITNESS JOHN W. PACE AS TO DETERMINATION OF ADJUSTED BOOK COST, WEDNESDAY, APRIL 23, 1941, RECORD PAGES 2861-2863, 2871-2873, 2877-2893, 2895-2899, 2903-2911, 2941-2949, 2953-2957, 2964, 2972-2974.

—2861—

Whereupon, JOHN W. PACE, called as a witness on behalf of the Commission, being duly sworn was examined and testified as follows:

DIRECT EXAMINATION by Mr. Springer.

Q. Mr. Pace, will you state your full name and position, please? A. John W. Pace, senior examiner of accounts for the Federal Power Commission.

Q. Will you state your qualifications, please, starting with your education? A. I attended grade and high school in Terrell, Texas.

I attended the Metropolitan Business College in Dallas, Texas, where I completed a one-year accounting course.

I also attended a private school in Dallas, Texas, conducted by a chartered accountant, where I studied general accounting for five years.

My experience, in general, has been as follows:

In 1918 I was employed by the Texas Power and Light Company in the Accounting Department where my duties involved handling of cash receipts, consumers' ledgers and material and supplies records.

For the period 1919 to 1923 I was employed by the

—2862—

Middle West Utilities Company. I was employed first as assistant treasurer and district auditor of all the southwestern properties belonging to this company. Later, I was advanced to treasurer and general auditor. The duties in this position were supervision of all accounting and re-

sponsibility for all financial matters. The properties under my supervision consisted of 20 corporations, including gas, light, water, traction and ice companies.

In 1924 I was employed for a short time by H. M. Byllesby Engineering Corporation. My duties with this company were auditing gas properties located in Oklahoma and Arkansas.

From 1925 to 1935 I conducted my own commission business in Dallas, Texas. This business consisted principally of appraisals of city property, financing homes, and buying and selling of oil properties located in the East Texas oil fields.

From 1936 to 1941 I have been employed by the Federal Power Commission as an Examiner of Accounts.

Q. Mr. Pace, will you state briefly your responsibility in the preparation of the two-volume original cost work marked for identification as Exhibits 57 and 57-A? A. Well, I was directly in charge of all the detailed work in connection with assembling the figures in this report.

Q. Now referring to the written statements in this two-volume work, and the supporting schedules, if appropriate questions were presented to you, would your answers be, in

essence, and your direct testimony, that which is contained in the two-volume work? A. Yes, they would.

Mr. Springer: Mr. Examiner, I offer in evidence at this time the exhibits marked for identification as 57 and 57-A, being the original cost of gas plant as at December 31, 1938, for the Hope Natural Gas Company.

Mr. Cockley: I want to object to these exhibits as not being a statement of the original cost at all. If they are offered for that purpose, I object to them. If they are offered as an adjusted book cost, for whatever relevancy that would have, I will not object; but as an offer of original cost I object to them.

It has been proved beyond any controversy, by the admissions of the witness the other day, that the figure in here is an adjusted book cost.

Mr. Springer: It was also proved by Mr. Smith, on examination of his definition of original cost and the principles of accounting that applied in this case, that this two-volume work is precisely offered as the original cost of the Hope Company's properties as of December 31, 1938, and that is the purpose for which I offer it at this time.

Trial Examiner: Well, it seems to me that that is something which might well be taken up in the briefs. The objection is overruled.

* * * * *

CROSS EXAMINATION by Mr. Cockley.

* * * * *

—2871—

Q. Now your schedule 1 on page 10 is the final summation of all these new plant accounts you are going to set up for the Hope Company, is that right? A. Yes, sir.

Q. Which are taken into the original cost? A. Yes, sir.

Q. I don't know that it is necessary to go over it again because Mr. Smith was over it yesterday, but isn't it a fact that what you did was to start with these various accounts as re-stated, start with the cost shown on the company's books, in column (d), and recognize the reclassification insofar as it was proper by the company, in columns (e) and (f), and arrive at a cost per books that merely reclassified these accounts? A. That was our starting point, yes.

Q. And the dollars in the reclassified book costs are just the same as the dollars in the book costs as set up originally? A. Yes, sir.

Q. That was just transferred from one account to another, all of them being shown on your page here, is that not so? A. Yes, sir.

—2872—

Q. And then you made adjustments both up and down in those, for various reasons, and arrived at a figure that is an adjustment of that book cost, shown in column (d), is that not so? A. In one sense, yes. However, we of course know that that is not on the company's books, it is what we have determined as being the actual cost.

Q. Well, now, Mr. Pace, did you listen carefully to my question? I did not suggest, did I, that the $51,207,000 is on the company's books. There isn't any doubt, is there, but that what is recorded on the company's books at the present time is $53,[illegible]06,000-odd, is that not so? A. That is correct.

Q. And your $51,000,000 is an adjustment that you have made of that figure of $53,300,000, is it not?

Mr. Springer: Would it be more understandable to him if you said net adjustment?

Mr. Cockley: I don't know, if he wants to say it was a net adjustment—

Mr. Springer: (Interposing) Of course there were additions and deductions in the adjustment.

Mr. Cockley: Of course.

The Witness: And that is the result of the net adjustments to those book figures.

—2873—

By Mr. Cockley:

Q. And am I further correct that all the subsequent schedules appearing in the rest of volume 1, and all that appear in volume 2, are merely supporting details for that figure? A. Yes, sir.

Q. And do you agree—I assume you do—with the statement made by Mr. Smith yesterday, that where you have used in here, investment in gas plant "per books," and at other places have used "book cost" or, as you do on schedule 2, "capitalized cost per books," that those

all mean the same thing and in total refer to the item of $53,307,000? A. Yes, sir, that is correct.

Q. And where you use those same expressions and say "as adjusted," they mean the total of $51,207,000? A. That is correct.

* * * * *

—2877—

Q. Well, regardless of the reasons, the fact is that you didn't make any investigation of the work orders, or any

—2878—

analysis of the work orders and the vouchers and the records of the prior utility, where they were available, to try to find out how much money the company drilling those wells had actually spent for drilling them, is that not so? A. No, sir, we didn't try to determine how much money they spent in drilling wells.

Q. And you did not at any time attempt to make any estimates of the amount they originally spent for drilling those wells, did you? A. No, sir, we don't go by estimates.

Q. What? A. We don't go by estimates.

Q. And you didn't go by estimates at any time in this so-called original cost study, did you? A. Not by estimates, no, sir.

Q. And you threw out every estimate that had been made of original cost where it couldn't be accurately determined from an analysis of vouchers and work orders and other records, is that not so? A. I don't think that we threw them all out, in the case of the prior utility acquisitions.

Q. Will you prepare for me a list of them that you didn't throw out? A. Well, I think most of the amounts that are recorded as prior utility costs were arrived at by estimates.

—2879—

Q. What is that? A. I think most of the amounts that are recorded as prior utility acquisitions, represent

estimates, and were estimated at the time the acquisition was made, according to the inventories that are attached to those vouchers.

Q. Were estimated at the time the acquisition was made? A. Yes.

Q. You mean 50 per cent of them or more, is that what you mean by "most of them"? A. Well, I would say more than that, because the vouchers that I examined all had an inventory attached to them, and from the notations shown thereon would indicate that all of them were estimated with the exception, maybe, of the Clarksburg Light & Heat.

Q. You are talking now about the vouchers of the Hope Company, are you not? A. Yes, sir.

Q. My point is that you did not analyze or attempt to analyze any of the vouchers, work orders or other records or data, of the utility that first devoted that property to public service, and from whom Hope purchased it as utility property, is that not so? A. We made an attempt to examine some of their records, but there were so few of them submitted to us that it was useless, so we gave up.

—2880—

Q. Well now, Mr. Pace, do you say that there wasn't submitted to you every record which the Hope Company had or could obtain, in its possession; and if there were records that they had or could obtain, and didn't submit them, will you tell me what they were? A. I didn't say that, I think they submitted to us all they had, but I don't think they ever had them.

Q. And in the absence of those vouchers of the company first devoting the property to public service, did you make any estimates at all as to the drilling costs or other costs? A. No, sir.

Q. Or as to the amount of money properly spent by those companies in acquiring that utility property, or in constructing it? A. No, sir, we accepted the company's estimate.

Q. Well, what you mean is that you accepted the figures that appeared on the Hope Company's books or records? A. Yes, sir.

Q. And in the case of well construction that was zero because they had no estimate? A. That is right.

Q. In the original records? A. That is right.

Q. And what I am asking you is that you did not at any time attempt to go back and determine the cost to the

—2881—

utility first devoting that property to public service, did you? A. No, sir. There is one exception there, that they did show well drilling cost in the acquisitions, and I think that was in the amount of approximately $160,000 which the Hope Company expensed at the time of acquisition. They did not put it in plant accounts.

Q. What did you do with it? A. We left it right there.

Q. By "leaving it right there," you mean you didn't put it in plant accounts either?. A. No, sir, we left it right there in expense.

Q. Let me see if I understand what you have just said. You have said that although the plant accounts of the utility that first devoted that property to public service showed the drilling expense for those wells acquired by Hope of $160,000, when Hope acquired it, it charged that to expense, and you did not restore it—do I misunderstand you or is that what you said? A. I don't believe I said that the vendor reflected that in their plant accounts. That amount was included in the purchase price of that property. Now whether it was reflected on the vendor's books in plant accounts or expense accounts, I don't know, but it was considered in the purchase of the property and was charged to expense in the Hope books.

Q. Well, the truth is that you didn't investigate the

—2882—

plant accounts of the company first devoting that to public service, to see whether to charge it to expense or whether to capitalize it, did you? A. I don't think those books were available.

Q. And in the absence of their availability, you made no estimate of it? A. No, sir.

Q. And your statement is, as I understand it, that Hope paid $160,000 on account of those drilling costs? A. In one particular case they did.

Q. In one particular case? A. Yes, sir.

Q. But that you did not include it in your statement of original cost because Hope subsequently charged that to operating expense instead of to capital account, is that right? A. Yes, sir, that is correct.

Q. You did not, in any case, consider it necessary to apply Instruction 2(C) of the Code of Accounts which you were following which states:

> "Detailed gas plant accounts 301 to 390 inclusive shall be stated on the basis of cost to the utility of plant constructed by it and the original cost estimated if not known, of plant acquired as an operating unit or system."

Is that right? A. We considered that instruction, of

—2883—

course, in determining our cost, but I don't believe that the instruction ever intended the accountants to do any estimating.

Q. Well, your view is that that contemplated that the engineers would make the estimate and furnish it to the accountants, is that it? A. No, my understanding is that it is up to the company to make the estimate and submit it to us.

Q. Well, isn't that exactly what Mr. Antonelli did? A. Well, of course in that one particular case we are discussing, I don't think he made any estimate there. I don't think it was necessary.

Q. Well, as a matter of fact, didn't he make estimates wherever he couldn't, from original records, analysis of original records and vouchers, find the actual dollars paid; didn't he make some estimates, where necessary, of drilling costs? A. Yes, sir.

Q. Didn't he make some estimates of overheads? A. Yes, sir.

Q. Aren't they all contained in Exhibit 20? A. Yes, sir.

Q. And wasn't that submitted to you and before you when you made this? A. Yes, sir.

Q. But you didn't either accept any of those estimates or check them, or use them in any way, did you? A. No, sir.

Q. Did your engineers in the Commission ever furnish you with an estimate of any kind, of any of those items? A. They didn't supply us with an estimate of those items, no, sir.

Q. Well, of any items that entered into this $51,200,000 you arrived at? A. I don't believe that there is anything in that, which represents estimates, no, sir.

Q. Did you ever request any of your engineers to give you an estimate of drilling costs or overheads, or any other items, the exact amount paid for which you could not determine from an analysis of the records of the company constructing that property? A. I don't believe that we did.

Q. Well, you know you didn't, don't you? A. Not that I remember of, at the present time; I don't think that we did, no, sir.

Q. Now as a matter of fact, as to these well accounts, Mr. Antonelli had determined the amount of dollars actually expended by the company first devoting this to public service, whether it was the Hope Company or a predecessor company, in the great bulk of those cases, had he not, and estimated it only in a relatively small number, compared to the entire item? A. Yes, sir.

—2885—

Q. Now let's come to the wells drilled by the Hope Company itself, and distinguished from those it purchased.

—2886—

To shorten this, isn't it a fact that as to all money spent by the Hope Company prior to 1923, which was not capitalized in its plant accounts, and represented the construction cost of wells drilled by it, you did not include any of that in your statement of original cost, did you? A. No, sir, we did not.

Q. It is not included in the $51,200,000? A. No, sir.

Q. Did you make any check of Mr. Antonelli's statement of original cost of drilling Hope's own wells, to see whether or not his statement of original cost was correct or not, his statement of the money spent in drilling those wells was correct or not? A. We checked a large part of it. I don't know whether we checked every bit of the well drilling costs or not, but we did check quite a number of wells.

Q. And you found his costs, as stated, to be correct in those cases? A. Yes, I think in most all cases it was exact.

Q. He had, for practically all of the Hope's own drilled wells, the original work order, did he not? A. Yes, sir.

Q. And the vouchers? A. Yes, sir.

Q. Which would show exactly how much money was

—2887—

spent for well equipment and how much for well drilling, and what it was, and all about it; didn't he? A. He had the records that were in support of the charges on the various work orders. Just how far in detail they went, I couldn't say from memory.

Q. So that you knew that the company had spent the dollars that he showed, when they originally drilled the wells of the Hope Company, did you not? A. Yes, I think that is right.

Q. Now in this Account 332.1, will you tell me how many wells were included in the inventory, including both those purchased by Hope Company from any source, and those drilled by the Hope Company? A. The total number of wells?

Q. Yes. A. At December 31, 1938?

Q. Yes. A. I think it was approximately 3300 or 3400.

Q. Approximately 3300, wasn't it? A. Something like that, yes, sir, approximately.

Q. And those wells were all in use, or were connected with the system on December 31, 1938, and were accepted in the inventories of the property, were they not? A. Yes, sir.

Q. Now in your Account 332.2, which is right below,

—2888—

the well equipment account, will you tell me how many wells are included in that account? A. The equipment?

Q. The equipment account—that includes 3300, all of them, doesn't it? A. That includes all the wells in service.

Q. Will you tell me how many wells are included in the item right above it of 4,000,000-odd dollars, which you set up for the well construction account? A. I believe it was 772.

Q. Less than 800 of the 3300 wells you show in your so-called original cost the amount spent for drilling them, is that right? A. Yes, sir.

Q. Stated the other way, there are nearly 2600 wells for which your figure contains not a dollar for drilling costs, isn't that a fact? A. Yes, sir, that is correct.

Q. And for all of the 2600 wells, or approximately that, that were omitted, that were drilled by the Hope Company, at least, you had available a perfectly accurate record of the amount of dollars the company had spent in drilling or constructing those wells, did you not? A. Yes, I think so: We didn't examine all of them.

Q. And if you had been instructed to include in your

—2889—

figures the actual amount of money that the company first devoting this property to public service had spent in drilling and constructing these wells, you would have had, in your adjusted figure on the right-hand column (J), page 10, substantially the same amount as Mr. Antonelli, would you not?

Mr. Springer: I object. His instructions didn't encompass that, as has been testified to by Mr. Smith and by himself, and why put a hypothetical question to this witness? He hasn't testified to the accounting principles. Mr. Smith is the expert on accounting principles.

Mr. Cockley: Well, of course this question goes to the accuracy of the figures. I want to see if there is any dispute about Mr. Antonelli's figures. This is the man that I have understood is responsible for the figures and who has checked them, and knows whether they are right. What I have said to him is, if he were setting it up on the same theory as Mr. Antonelli, if he wouldn't have had substantially the same figure that Mr. Antonelli had.

It is a perfectly proper question.

Trial Examiner: The objection is overruled.

The Witness: Please read the question.

(The question was read by the reporter.)

By Mr. Cockley:

Q. Well, perhaps that isn't a fair way to ask it. I will change it to read this way:

—2890—

If you had been instructed to do what I have said in that question, you would have had, for Account 332.1, substantially the same figure as he had, would you not? A. Yes, sir, our figures would probably have been the same. I think his figures are correct.

Q. I mean, you don't make much question about the accuracy of his figures? A. No, sir, I don't.

Q. The whole dispute is the question of whether or not they are a part of the original cost or whether they are not, is that right? A. Yes, sir.

Q. Thank you.

Now in various of these accounts—I will not take you through them in detail—but there were overheads that Mr. Antonelli, or for which Mr. Antonelli did not have original records, and for which he made estimates, is that not so? A. Yes, sir.

Q. And he has included them in his figures, and you have not included them in any of yours? A. That is correct.

Q. Now I suppose there would be no dispute that a proper amount of overheads is necessary and is permissible to be added to the direct cost of materials and labor, and capitalized in the account, is that not so? A. Well, our

—2891—

system of accounts provides for a reasonable amount to be attached to cost so long as it is in accordance with good accounting.

Q. Did you make any estimates at all of overheads to be applied, properly applied, to these various accounts? A. No, sir.

Q. So that you didn't form any opinion, one way or the other, as to whether Mr. Antonelli's overheads were reasonable or not, his estimate of overheads were reasonable or not? A. Well, we did form some opinion in that respect inasmuch as we wouldn't agree with certain amounts that he excluded from his estimates.

Q. You wouldn't agree to certain amounts that he excluded from his estimates? A. Yes, in arriving at his ratios. I mean, certain amounts that he has excluded from his total expense in order to arrive at the ratio of the amount to be charged to construction.

Q. Well, just where was your difference with him, what did you investigate and what use did you make of overheads? A. Well, we didn't make any estimates; we merely made a check of what he shows here in his Exhibit 20, and in that respect we couldn't agree with him in some of his figures.

Q. Well, what do you think he excluded that he should

—2892—

not have excluded? A. Well, in arriving at his ratio between the operating expense and construction cost, he excluded from his operating expense gas purchased for resale; gas used for compressor station operations; depreciation and amortization items; and taxes other than payroll taxes—these items were excluded from the total expenditures that the overheads were applicable to, which states that they were applicable to all operating expense with the following exceptions that I have just read, plus the total gross additions to investment.

I don't know that we would agree altogether with that basis of distribution of those costs.

Q. Well, what basis would you take? A. Well, it seems to me that part of the overhead costs should apply to the items that he has excluded. There probably wouldn't be a great deal of difference, but then there would be some.

Q. Well, how much difference would it make in the percentage; what percentage did he arrive at finally? A. Well, this page is full of them, I don't know which one you have reference to.

Q. Well, what was the over-all picture, or which one do you think ought to be changed? A. I don't believe there is an over-all percentage shown on this page, it is broken down between general overheads, purchasing, land,

—2893—

payroll, and so forth, and each one of them shows individual ratios.

Q. And which one would you change? A. Well, it would probably, to a certain extent, change all of them. I don't know just how much it would change them, because we didn't figure that.

Q. That is the only criticism you have to offer of his estimates of the amounts to be excluded from current expenses for construction overheads, is that right? A. Well, that is the only criticism I have as to his estimate as he made it.

Q. And would the amount you exclude be more or less than he excluded? Are you able to say? A. It would be less, I think.

Q. That is, you think more ought to be included in operating expenses, and less capitalized, is that it? A. It would have that effect, yes, sir.

Q. But you can't say how much less, if any? A. No, I couldn't give you figures.

Q. And on this whole picture, it would make almost no difference at all, would it? A. Well, I don't know just to what extent it would go. I should say that the gas purchase would probably amount to a considerable difference, if it was included.

* * * * *

—2895—

Q. Well, you think, do you, that $8,000,000 spent for the purchase of gas under these permanent contracts, that every one of those dollars requires as much supervision as it does for dollars spent for labor, for example, in the course of a year? A. Well, I don't know that it would require altogether as much supervision.

Q. Well, you know it wouldn't, don't you? A. I don't believe it would, no, sir, to be frank.

Q. It would be an infinitesimal fraction as much, would it not? A. It probably would, yes, sir.

Q. And if you made your complete adjustments that you are talking about, you wouldn't substantially change

Mr. Antonelli's figure, isn't that a fact, his percentages? A. Well, I couldn't say, I made no attempt—

Trial Examiner: (Interposing) I am not sure that I understand the relationship between the direct testimony of this witness and Mr. Antonelli's figures. Are these figures in columns (e) and (f), headed "reclassification by company," supposed to be Mr. Antonelli's reclassifications and

—2896—

adjustments?

The Witness: Yes, sir, in columns (e) and (f), those figures were determined by Mr. Antonelli.

Trial Examiner: But your adjustments were not based on Mr. Antonelli's adjustments, were they, or on the figures he got after those adjustments?

The Witness: Well, Mr. Antonelli's figures, shown in columns (e) and (f), merely represent a reclassification of the number of dollars that were shown on the books—

Trial Examiner: (Interposing) What I am trying to get at is whether or not you analyzed all Mr. Antonelli's figures to determine whether they were correct or not, and just what bearing that would have on your adjustments?

The Witness: Yes, sir, we examined every one of Mr. Antonelli's adjustments in detail.

Trial Examiner: And you took the results of that investigation into account in making your adjustments?

The Witness: Yes, sir.

By Mr. Cockley:

Q. Well, as a matter of fact, what you did here is merely to accept his adjustments insofar as you approved them, and you eliminated all others, isn't that right? A. Yes, sir; we did examine them, though.

Q. Yes. And you checked and spot-checked them very

—2897—

carefully, didn't you? A. Very carefully.

Q. But your exhibit nowhere shows the items that are included in Mr. Antonelli's adjustments, which you have not accepted, in any way,—or as I would put it, ignored; isn't that right? A. No, sir, it doesn't show them at all.

Q. You have taken merely the part of it that you were willing to accept? A. Yes, sir.

Q. Well, so far as these overheads are concerned, the reason you rejected them wasn't that they were too high, was it, or too low? A. No, sir, it was not.

Q. If you had agreed with them right to the penny, you still wouldn't have added them to your figures in any way, would you? A. No, sir.

Q. Now I want to hand you, Mr. Pace, a paper that I am going to have marked Exhibit No. 59 for identification.

Trial Examiner: It may be so marked.

(The document referred to was marked Exhibit No. 59 for identification.)

By Mr. Cockley:

Q. Now, Mr. Pace, this paper which I have had marked for identification as Exhibit No. 59, attempts to set up on

statement 1 here, the original cost as shown in Exhibit 20 of Mr. Antonelli, in the first column of figures, and your adjusted book cost as shown in Exhibit 57-A, and I direct your attention there to Account 332.1, which is the account we have just been discussing, is it not? A. Yes, sir.

Q. And the difference shown of $13,694,000, is in part the drilling cost of wells drilled by the Hope Company, and in part the cost of drilling wells of other utilities purchased by the Hope Company? A. Yes, sir.

Q. And in part overheads? A. Yes, sir.

Q. Is that not so? A. Yes.

Q. We would be glad to have you check these figures, all of them, and if you find any error in them, to have you

report that, because we want an accurate comparison in the record.

Now am I correct, then, that practically all the problems you had in connection with this were where you disagreed in principle with what occurred in that well-drilling account? A. Yes, I think that is the majority of the difference.

Q. I don't mean by that to say that there weren't disputed items in other accounts, but that account illustrates the three things that I have discussed with you where, in

—2899—

principle, you were not in agreement, doesn't it? A. Yes, sir.

* * * * *

—2903—

Q. No, I am talking about this $120,000 of labor that you say you disallowed because they were estimates, and you didn't know how they were made, and I am asking you if it isn't a fact that these represented construction costs and labor costs of lines for which there was no labor cost recorded in plant accounts, so that you know they are other lines, and of course you know they got into the ground in

—2904—

some way, don't you? A. Yes, but that still wouldn't keep me from thinking that there might be a possibility of improper distribution of labor.

Q. Well, it is true that you don't just know now why you did turn it down, isn't that a fact? A. Because I didn't think it was properly supported, it was estimated and I wasn't convinced that the expenditures were made.

Q. And when you came to an item that you didn't think was properly supported, was an estimate, and so on, you didn't go out and determine what the right estimate for that was, did you? A. No, sir.

Q. You just turned it down and didn't use it, isn't that a fact? A. That is right.

Q. As to all the estimates that were submitted to you by Mr. Antonelli, in this account and others, did you have an engineer review those estimates to see whether they were proper or not? A. I didn't, no, sir.

Q. As far as you know, nobody on the Commission's staff reviewed them to see whether they were proper, no engineer? A. Not that I know of myself.

—2905—

Q. At any rate, if they did, they didn't report to you about it, and they are not reflected in any way in your figures, are they? A. No, sir.

Q. Well, you didn't assume to review an engineering estimate yourself and arrive at an opinion as to whether it was proper or not, did you? A. No, sir.

Q. Now, Mr. Pace, I direct your attention to the next group of accounts known as Transmission Plant. I am correct, am I not, that the only sizable items of difference there are $284,000 for compressor station structures; $1,048,000 for mains, which is transmission mains; and $629,000, which is compressor station equipment—is that right? A. Those are the three principal amounts.

Q. And two of those three items relate to compressor stations, and the other, transmission mains. That represents practically all the money in that group of accounts, doesn't it? A. Yes, sir, that is correct.

Q. Am I correct that we have already discussed the principles that you applied in determining your figures on all of those items? A. Yes, sir.

Q. That is, these differences would be due to direct

—2906—

material and labor costs omitted, or for which no records were available and estimates were made; and overheads, would they not? A. Yes, sir.

Q. Now I direct your attention to the second statement that appears in this exhibit, and we would be glad to have you check it, and I want to say to you, so as to save

time, that here is set out, in paragraph (a), the direct material and labor cost, the differences, I will say, between Mr. Antonelli's exhibit and yours, which consist of direct material and labor costs which you did not allow because they were not capitalized, or because they were estimated—$14,023,000.

The next item is $679,000, which you transferred to utility plant in service. Now am I right that that item consisted of unoperated leases and some wells, that it consisted almost entirely of those two items, which you transferred out of the utility plant account? A. I don't believe it was transferred entirely out of the plant accounts; it was probably transferred out of the plant in service account.

Q. That is what I meant to say.

So that it would still appear, if the books were set up the way you think they ought to be, it would still appear on the books of the company? A. Yes.

—2907—

Q. And it isn't a disallowance; it is merely setting it aside for a particular reason, is it not? A. Yes.

Q. It is the other items that make the real difference between you, isn't it? A. Yes.

Q. But this $679,000 is not shown in your $51,000,000 figure, is it? A. No, sir, that isn't included in the $51,000,000.

Q. And it is in Mr. Antonelli's figure of $70,000,000, isn't it? A. Yes, sir.

Q. Then follows there the overheads and the Interest During Construction, which is also at some times considered a type of overhead, isn't it? A. Yes, sir.

Q. And the reasons why you have eliminated each of these groups are shown—I would be glad to have you check this and tell me if this is a correct statement, and Mr. Antonelli's work figures on it are available.

Now I direct your attention to Statement No. 3, which is, in turn, a classification and break-down of the $14,000,

000 item of direct material and labor costs, and I will be glad to have you make such check of this as you care to and report, if it isn't accurate.

—2908—

But for present purposes, assume it is accurate, and I will ask you if it isn't a fact that the items of property or costs for the construction of property, shown on that page, are not of property that was included in the inventory as of December 31, 1938? A. They are included in Mr. Antonelli's statement.

Q. Well, it is included in the inventory of the Hope Company's property, isn't it? A. Yes, sir, I assume that it is, I didn't check that inventory.

Q. And that inventory was checked and accepted, and it is the one from which you worked also, isn't it, or didn't you pay any attention to the inventory? A. I didn't check it myself.

Q. I didn't ask you about checking it, but did you use it? A. In a manner, yes. It is reflected in the detailed original cost study.

Q. Tell me this,—go to item (f), this well construction account—the 2633 wells, the drilling cost of which is omitted in your statement—those wells were all in the inventory, weren't they? A. Yes, sir.

Q. There is no doubt about that, is there? A. I don't think there is, no, sir.

—2909—

Q. Take the next item of 803,000, the construction costs for 803,000 feet of pipe, ranging in size from 1-inch to 20-inch. That pipe was in the inventory, wasn't it? A. Yes, sir. Mr. Antonelli shows it in his inventory.

Q. For my purposes, assume it was in the inventory, and if you have any doubt about it, check it and report; but now, as a matter of fact, that in its entirety represents money paid by the company first devoting this property to public service for the construction of that property, which

is not reflected in your Exhibit 57-A; isn't that so? A. Those amounts are not reflected in my exhibit.

Q. That is right,—not even to the extent of a dollar, are they? A. No, sir.

Q. And the fact is that your exhibit does not include the money originally paid, for example, in constructing 275 buildings ranging in size from 4' 2" x 5' 6" x 7' 5" to 30' 4" x 20' 6" x 7' 7"? A. It might include that, yes, sir.

Q. What is that? A. It might include that cost, yes, sir.

Q. You think your figures do include that cost? A. I said they might.

Q. Will you check that, and at a later time report to me whether you have a single dollar in there for the con-

struction of the warehouses, barns, garages, blacksmith shop, and so on, that are listed there? A. I am afraid that would take another two years to do that.

Q. Mr. Antonelli's work sheets are available, and it won't take you long to check. A. I think it is quite possible that those figures are in our cost figures at the present time. That, again, is a matter of improper distribution of costs.

Q. What do you mean by improper distribution of costs? A. Well, you build a compressor station there and you build one of these little garages or something around it, and whether the labor is buried in the cost of that compressor station or whether it is properly allocated to that little bitty house out in the back yard, I couldn't say. I say it is possible for it to be in there.

Q. Well, your theory is that if you build a garage 30 x 20, and for some reason or other the cost of the materials and the cost of the labor and everything else that goes into that garage originally are not shown in plant accounts, it should be excluded from a consideration of the amount of money actually spent in the first instance for it? A. I

should be included in plant accounts, but the proper cost should be allocated to it at the time it was constructed. As I understand this, Mr. Antonelli has inventoried these

—2911—

buildings and now claims that he finds no costs in the company's records to cover those buildings, which I say doesn't mean that the costs are not, in some manner, already recorded in the plant accounts.

Q. And did you investigate and find out how much they were in the plant accounts at? A. No, that would be practically impossible for us to do.

Q. Well, if it was impossible to do it from an investigation of the books and the vouchers and an analysis of them, did you make any estimate of it? A. No, sir, we didn't make any estimate; it would be practically impossible.

Q. You just didn't put it in, is that right, either by way of estimate or by way of exact ascertainment? A. No, sir, we didn't include it at all.

Q. And the same thing is true of every single one of the items that are listed on this page? A. None of those costs are included in our $51,207,000.

Trial Examiner: The hearing is recessed, to reconvene at 2 o'clock.

(Whereupon, at 12:30 o'clock p. m., a recess was taken until 2 o'clock p. m., of the same day.)

* * * * *

—2941—

Q. Now, coming back to the first page of this Exhibit 57, the middle paragraph says: "Volume 1 sets forth the investment of Hope Natural Gas Company in gas plant per company books as adjusted at December 31, 1938." I think we developed before that what you mean by investment of the Hope Natural Gas Company in gas plant per company books is the $51,200,000 we have mentioned; is that right? A. No, sir, the $53,000,000.

Q. I am sorry. It is the $53,000,000, which, as adjusted, means the $51,200,000? A. That is correct.

Q. Then you say the adjusted figure—you are there talking about the adjusted figure of $51,200,000? A. Yes.

Q. You say the adjusted figure developed in that way shows the original cost as defined in Federal Power Commission's Uniform System of Accounts for Natural Gas Companies of a gas plant. I suppose that still refers to the

—2942—

same figure, does it not? A. Yes, sir.

Q. It is now called an original cost as defined in the Federal Power Commission's Uniform System of Accounts; is that right? A. Yes, sir.

Q. And that is all you mean when you put it on the front cover "Original cost of gas plant as at December 31, 1938"? A. Yes, sir, we are accepting that as the original cost.

Q. It is a different name for the same figure; is that right? A. It is the original cost. That is what we have determined as original cost of the plant, regardless of what it is called.

Q. Then, what you have determined is in accordance with your interpretation of the Uniform System of Accounts? A. Yes, sir.

Q. And that is all it is? A. Yes, sir.

Q. Now, Mr. Pace, it is perfectly clear, is it not, that that figure is not intended by you to be a statement of all of the dollars that were spent by the Hope Company and other persons who first constructed the property shown in

—2943—

this inventory and devoted it to public service at the time it was so constructed? A. It does not, of course, represent every dollar of cost that was spent, but it does represent all of the dollars of cost that we consider as the real original cost of the property.

Q. What you mean by that is, it represents all of the dollars that the companies at the time charged up on their plant accounts? A. We think it represents all of the costs that were put into plant accounts then or at any other time.

Q. Let us avoid the word "cost" because Mr. Smith told us the other day that it had various meanings. A. I said cost in plant accounts.

Q. Is it not a fact that if you had been turned loose and asked, regardless of the Uniform System of Accounts and regardless of interpretation of that, to determine the amount of dollars actually spent for construction of property of the Hope Company by the company first devoting it to public service, that you would have had many millions of dollars more than shown in this exhibit; there can not be any doubt about that, can there? A. If I had to total the number of dollars spent without determining where the cost was—

—2944—

Q. Properly spent, I mean, of course.

Mr. Springer: Permit him to finish his answer.

Mr. Cockley: I thought he had.

The Witness: If it was just a matter of totaling up the number of dollars spent, I would probably come out with a lot more dollars, but I do not see that would change our figures as far as plant accounts are concerned.

Q. Did you understand my question to include dollars properly spent, necessarily spent in the construction and for property in use on December 31, 1938? A. I still say if we were just instructed to total up the number of dollars spent, we would probably have a larger figure than shown here, but that is without showing any distinction as to where the cost should be shown.

Q. Well, if without reference to how the books were kept over the years you had been told to go back to the original vouchers and the original records as far as you could and to make estimates where you could not get them,

but to come in, in the end, with the dollars actually paid by the company first devoting this utility property to service, you would have had substantially Mr. Antonelli's figure, would you not? A. May I have the question again?

Mr. Springer: I object. This witness has testified to volumes 1 and 2, Exhibits 57 and 57-A, original cost, and

—2945—

states that in his opinion that was the only valid original cost for the Hope Company property. He has not done anything of the kind Mr. Cockley has asked him to assume. He has said the original cost depends upon the principles of accounting by the company in the past, and since under the accepted principles of accounting some goes into operating expenses and some is capitalized, you get a different answer, and I do not think it is a proper question to put to Mr. Pace.

Trial Examiner: You summarize in a general way his testimony, but I do not know that I get the objection. Do I understand that the witness is to assume that this calculation or determination which he makes will conform to the Uniform System of Accounts?

Mr. Cockley: Yes, he is to assume it conforms, if he wants to, but I am asking him if it is not a fact if he were sent out without any specific instructions as to how he is to go about it, but he was merely to determine the actual dollars spent in the construction of this utility property as it existed at December 31, 1938 at the time it was constructed, and properly spent by the company first devoting it to public service, if he would not have substantially the same amount shown by Mr. Antonelli in Exhibit No. 20.

Mr. Springer: But you have not included in this ques-

—2946—

tion he would have access to income statements as well as plant accounts.

Mr. Cockley: I do not have to include in my assumption something you think should be in the assumption.

Mr. Springer: You are asking him to ignore the other part of a Siamese twin; you are confining it to plant—

Mr. Cockley: I do not care to argue with you, Mr. Springer. I have asked a question and you have not made a legal objection to it.

Mr. Springer: I object to his asking Mr. Pace under an assumption that would call for a similar study that Mr. Antonelli made and which Mr. Pace has challenged here by putting in a different original cost statement showing the only valid original cost for Hope Natural Gas Company at the end of 1938.

Trial Examiner: I assume the witness as an accountant would know what he would have to do to make the determination. I do not understand that counsel has restricted him to any particular records of any kind. The objection is overruled.

Mr. Cockley: Will you read the question?

(Question read.)

—2947—

Trial Examiner: Read the question, please.

(Whereupon the reporter read the pending question.)

The Witness: Not for plant accounts, I wouldn't.

By Mr. Cockley:

Q. I didn't ask you anything about plant accounts. I am asking you to state the dollars actually and properly spent for property in existence on December 31, 1938; but at the time that property was first devoted to public service by the company constructing it? A. As far as total number of dollars is concerned, of course if I secured my information from the same records that he did—

Trial Examiner: (Interposing) And made the same estimates?

The Witness: Yes, and made the same estimates—I would probably come out with approximately the same number of dollars; but again I would say that I don't know

that we would be anything like close together so far as plant costs are concerned.

By Mr. Cockley:

Q. What do you mean by "plant costs"? A. He shows plant costs—

Q. (Interposing) That is a classification; but I am asking you what you mean by "plant costs"? A. The costs that are charged to plant in accordance with good accepted accounting principles.

Q. And it is only that part of the cost that is charged

—2948—

to plant that you have used, isn't it? A. Yes, sir.

Q. And the other part of the cost, like well drilling, that is drilling that was charged to expense, you haven't shown? A. No—in this case where it was expensed, I left it there.

Q. All right. In other words, you haven't any doubt, have you, that if you spend $5000 for drilling a well, and $5000 for equipping it, that the original cost of that well, the actual dollars spent for it, is $10,000; there is no doubt about that, is there? A. Not a bit.

Q. Now if subsequently the utility charges $5000 of that to expense and $5000 to plant account, you treat the cost of that well from there on as $5000, don't you? A. Yes.

Q. And as far as you are concerned the original cost changes the minute you put it on the books, from $10,000 to $5000, doesn't it? A. The original cost of plant account does.

Q. I am talking about the original cost of the well. A. The total number of dollars of course remains the same.

Q. And you didn't try in this case to go back and determine, in the case of any item of property, that total number of dollars originally spent, regardless of how it

—2949—

was charged, did you? A. No, sir.

Q. And I suppose you carry that distinction you have just made into the title here, and that when you say "Original Cost of Gas Plant" you mean by that the original cost of the gas plant account as distinguished from the property of the Hope Company for which those accounts stand, is that right? A. Yes, sir, that is the original cost of the gas plant as determined by the Federal Power Commission examiners.

Q. In other words, in the case of wells you have got the original cost of the well account set up rather than the original cost of drilling and equipping the wells themselves, haven't you? A. Well, this exhibit is only for the original cost of the amounts that are properly chargeable to gas plant.

Q. And not the original cost of the drilling and equipping of the wells, but only that part of the cost that is carried over to the gas plant accounts; isn't that right? A. It is the original cost as we determined it.

Trial Examiner: Does the City of Cleveland have any questions?

Mr. Reeder: One or two questions.

* * * * *

—2953—

Re-Direct Examination by Mr. Springer.

Q. Mr. Pace, will you please refer to page 6 of Exhibit 57, and the last sentence on that page, "It is the opinion of the examiners that the amounts recorded at the

—2954—

time of acquisition represent the original cost as near as can be determined" is the logical result of your substitution of Hope's book figures for Mr. Antonelli's opinions and estimates, isn't it? A. Yes, sir.

Mr. Cockley: I object to that.

Mr. Springer: He has already answered it yes.

Mr. Cockley: All right.

By Mr. Springer:

Q. Mr. Pace, you are aware of the provision in the Natural Gas Act, aren't you, which provides in Section 8 (B) that the burden of proof is on the Hope Company to support claimed expenditures or any items questioned by the examiners of accounts?

Mr. Cockley: I object to that as a wholly improper question. It certainly is not true, as a matter of fact.

Trial Examiner: It doesn't mention the Hope Company, does it, Mr. Springer?

Mr. Springer: No, but it mentions natural gas companies, and Hope is a natural gas company.

Mr. Cockley: Let's be fair about this. We are not making an application to this Commission for an increase in rates, or anything else. We were asked, if not directed, to go ahead and put on our evidence first, and we did it, and did it with the express reservation that we were not thereby assuming any burden of proof. There is no burden of proof cast upon a company which is merely in defend-

—2955—

ing existing rates. If it asks for additional rates, yes, but when it is defending merely existing rates, it does not have any burden of proof, the burden is upon those who allege they are unreasonable and unfair, which is the City of Cleveland in this case.

I don't think it is a proper question to ask this witness in any event; what he knew or didn't know about the burden of proof is a matter of interpretation of the statute in this case.

Mr. Springer: Mr. Examiner, this is a provision of the Natural Gas Act and it is not confined to rate making; it covers specifically, Accounting.

Trial Examiner: Well, that is another question which might well be argued in the briefs. It seems to me that the question is not improper. The question asked the witness is as to whether he is acquainted with this provision in the Act. He isn't called on to interpret the Act or its practicability in the instant case. If counsel expects to go that far I think perhaps we have a different problem.

The objection is overruled.

Mr. Cockley: I would like to have the question read, please?

(Whereupon the reporter read the pending question.)

Trial Examiner: I understand you are willing to amend that to eliminate the use of the Hope Company's name?

Mr. Cockley: I withdraw my objection.

Mr. Springer: Well, any natural gas company, and make it a general provision.

—2956—

Trial Examiner: Of course there is no provision in the Act as you suggest, that is the point.

Mr. Cockley: I wasn't objecting on that ground, but of course the Examiner is perfectly right.

Mr. Springer: May I quote from Section 8 of the Natural Gas Act which is included in the forepart of the copy of the Federal Power Commission's Uniform System of Accounts, Exhibit 58 in this record:

> "The burden of proof to justify every accounting entry questioned by the Commission shall be on the person making, authorizing or requiring such entry, and the Commission may suspend a charge or credit pending submission of satisfactory proof in support thereof."

What I have done is paraphrase that in my question.

Trial Examiner: You are familiar with that provision are you, Mr. Pace?

The Witness: Yes, sir.

By Mr. Springer:

Q. Well, Mr. Pace, as a principle of accounting, when you audit any company's books you demand satisfactory proof that an expenditure has been made, don't you? A. Yes, sir.

Q. And you insist on documentary proof where it is

—2957—

available, don't you? A. Yes, sir.

* * * * * *

—2964—

Trial Examiner: Is there any re-cross examination of this witness?

Mr. Cockley: One or two questions.

RE-CROSS EXAMINATION by Mr. Cockley.

* * * * *

—2972—

Q. Now your attention was directed to Section 8(A) of the Natural Gas Act which has a sentence in it that the burden of proof, to justify every accounting entry, shall be on the person making or authorizing or requiring such entry—and I think you said you knew that and were you instructed that that imposed upon the Hope Company the duty of supporting, by entries and vouchers, any entry that you might challenge in its accounts? A. I didn't have specific instructions in the case of the Hope Company, but we have always had instructions to carry out those—

—2973—

Q. (Interposing) That is your general instruction? A. That is my general instruction.

Q. And you felt perfectly free in this case, as applied to the Hope Company, when you came to an item which you questioned, to have the company produce its records on it, and if you were not satisfied with the records or the esti-

mate or whatever it was, you felt perfectly free to disregard it, and just because the company hadn't produced as much evidence as you thought it should have produced: is that right? A. That is correct.

Q. And it is your understanding that this Section that I have read to you is applicable to a respondent whose rates are challenged, as the Hope Company's rates are, in this kind of a case? A. That is my understanding.

Q. And it is applicable to the investigation that you conducted, is that right? A. That is my understanding.

Q. And this exhibit was prepared in part on that assumption, was it? A. Yes, sir.

Q. It was prepared throughout on that assumption, but I suppose you didn't have to apply this rule to every

—2974—

item, did you, Mr. Pace? A. No, not quite.

Mr. Cockley: That is all.

## 11. TESTIMONY OF COMPANY WITNESS PETER ANTONELLI AS TO ORIGINAL COST OF PROPERTIES ACQUIRED FROM PRIOR UTILITIES, MONDAY, JULY 7, 1941, RECORD PAGES 5042 TO 5049.

—5042—

By Mr. Milde:

* * * * *

Q. Have you read the testimony of Mr. Pace on the subject of original cost as he defines it? A. Yes, sir.

Q. Do you recall Mr. Pace's statement that the Hope Company made estimates of the original cost to acquire utility properties at the time it purchased them? A. Yes, sir, I do.

Q. Do you further recall that Mr. Pace referred to the acquisition of the Fayette County Gas Company and the Flaggy Meadow Gas Company properties? A. Yes, sir, I recall that.

Q. And specified Voucher Nos. G-353 in 1910 and M-44 in 1902 as showing that such estimates had been made? A. Yes, sir.

Q. Do you have before you the Hope Company's vouchers pertaining to the Fayette County Gas Company

—5043—

acquisition to which Mr. Pace referred? A. I will get them.

Q. Do you now have those vouchers before you, Mr. Antonelli? A. Yes, I do.

Q. How many vouchers were involved in this Fayette County Gas Company acquisition? A. Two vouchers.

Q. Where are they, or what are their numbers, rather? A. One is E-95, 1910; and the other is G-353, 1910.

Q. What does Voucher E-95 show? A. Voucher E-95 shows the amount of money that Hope Natural Gas Company paid Fayette for the properties that they purchased in 1910.

Q. How much was that? A. $600,000.

Q. What else does it show? A. On its face it bears the written receipt of the Fayette County Gas Company, and also debits Fayette County Gas Company purchase account with $600,000.

Q. You say this is an actual receipt of the Fayette County Gas Company for $600,000? A. Yes, sir, there is a written receipt right here.

Q. What does the other voucher, G-353, show? A. This voucher credits the Fayette County Gas Company pur-

—5044—

chase account with $600,000, distributes the cost over the plant accounts, and charges each account with its allocated portion.

Q. Did you say that it distributes the cost—do you mean the $600,000? A. Distributes the purchase price.

Q. Does that voucher show how that purchase price of $600,000 was distributed to the various plant accounts? A. Yes, sir, it does.

Q. And how was that made, as shown by the voucher? A. The distribution was made by pricing a field inventory, using current market prices as of the date of the purchase.

Trial Examiner: Is that what the voucher says?

The Witness: No, the voucher doesn't say that. It says that they paid $600,000. This is a credit of $600,000, and it shows it distributed in these various accounts, but here it shows the various amounts for the pipe account.

By Mr. Milde:

Q. Will you explain to the Examiner that that voucher includes subsidiary pages which appear in the envelope that you have before you? A. Oh, yes, I have another part of this voucher here that shows the inventory that I just referred to, and also the current market prices that the Company used to price this inventory.

—5045—

Q. How do you know they are current market prices? A. By spot-checking some of these prices we were able to

say that they are current market prices, and also from Company men we know that that is the current market price, and they are different from the original cost price.

Now I might say that after we spread these costs, we adjusted the total to the total shown on this voucher; in other words, we came to the $600,000 when we were finished.

Q. Was there anything in that inventory that showed when the properties were originally built, or anything of that sort? A. No, sir, it is just an inventory, using certain prices, and then adjusted.

Q. And if the price didn't come out right, some adjustment was made all along the line, is that what the voucher shows? A. Yes, sir. That makes me believe that it couldn't be original cost or actual cost to the predecessor, or anything of that kind.

Q. Then those amounts that were arrived at that way were used to distribute the purchase price, were they? A. Yes, they were used to distribute the purchase price over the various accounts, plant accounts.

Q. Now do you also have before you the Flaggy Meadow purchase voucher M-44, for 1902, to which Mr. Pace

referred? A. Yes, I have M-44, and I have M-45.

Q. Was there more than one voucher involved in that acquisition? A. Yes, there were several vouchers involved, they are all here.

Q. Well, what does M-45 refer to, which you just mentioned? A. M-45—

Q. (Interposing) Or rather, what does it cover? A. It covers the payment of Hope Natural Gas Company to Flaggy Meadow Gas Company, amounting to $1,134,010.60. It shows—it is a written receipt that the Flaggy Meadow Company received this money, here is the written receipt (indicating); and it also debits Flaggy Meadow Gas Company account with the purchase amount.

Q. You mean an account called Flaggy Meadow purchase account? A. Yes, sir, that is it.

Q. Well, that shows that the Hope Company paid $1,134,000 in round figures for that property, and that the Flaggy Meadow Gas Company received that amount of money, is that right? A. Yes, sir, that is what it shows.

Q. What does Voucher M-44 show? A. M-44 shows that the Company credited the Flaggy Meadow Gas Com-

pany account with the amount of $1,134,010.60, and distributes that cost over the various plant accounts.

Q. How is that distribution of the purchase price made? A. It is made in the same manner as I just described in connection with the Fayette County Gas Company purchase in 1910, namely, by distributing this purchase price over an inventory, using current market prices, and then adjusting the total of these to the purchase price.

Q. Now do these vouchers, in connection with the Fayette County Gas Company acquisition and the Flaggy Meadow Gas Company acquisition, indicate in any way that the Hope Company estimated the original cost of these purchased properties to the companies from whom they bought these properties, and made that estimate at the time of purchase? A. Not at all, it is very evident that the Hope Company did not attempt to estimate the original cost of these properties.

Q. Now, Mr. Pace in his testimony referred to the fact that on the Flaggy Meadow voucher M-44, there appeared the words "Average Cost."

Will you explain where that appears? A. This "Average Cost" appears in one of the summary statements, but this, again, is the adjusted current market price that the company used in pricing the inventory as of the date of the purchase, and it is not the cost to Flaggy Meadow Gas

—5048—

Company.

Q. And did you check to ascertain that the costs, or rather the prices used for this inventory pricing in connection with these purchase price distributions over the plant accounts, were not the cost to the predecessor company? A. Yes, sir, it was very plain that it was not the original cost price. We determined the original cost and we know what the actual price is.

Q. And the original cost, as you found by your investigation, was other than the purchase price or the prices appearing in this priced inventory that distributed the purchase price? A. Certainly. The original cost of the— the properties were built at various years, and they couldn't be the same prices.

Q. Are you familiar with Mr. Dunn's testimony that in connection with properties purchased from non-utilities, the practice of the Hope Company was to record the original cost of these properties as nearly as it could be determined at the time of acquisition? A. Yes, sir.

Q. In connection with your examination of the Company's records pertaining to purchased properties, in the course of your original cost study, did you ever find one instance in which the Hope Company estimated or at-

—5049—

tempted to estimate the original cost of the properties purchased at the time of acquisition? A. No, sir.

Q. Did you ever find the Company recorded or attempted to record any estimate of the original cost of purchased properties at the time of acquisition? A. No, sir.

12. **COMPANY WITNESS ANTONELLI'S EXHIBIT NO. 59 ENTITLED: "Comparison of Original Cost (Exhibit No. 20) with F. P. C. Examiners' Adjusted Book Cost (Exhibit No. 57)"**

Statement 1

## HOPE NATURAL GAS COMPANY

## Statement 2

### Parts of Original Cost (Exhibit No. 20) Excluded from F. P. C. Examiners' Adjusted Book Cost for Total Gas Plant (Exclusive of Distribution)

| | Description | | Costs |
|---|---|---|---|
| (a) | Direct material and labor costs: | | |
| | For property constructed by Hope and property purchased not as an operating unit | $12,276,097.31 | |
| | For property purchased by Hope from other utilities as an operating unit | 1,747,698.39 | |
| | Total direct material and labor costs | | $14,023,795.70 |
| (b) | Transfers by F. P. C. Examiners from Utility Plant in Service | | 679,093.74 |
| (c) | Overheads: | | |
| | Unloading, hauling and warehouse handling costs | $ 402,010.63 | |
| | Indirect field costs | 434,660.36 | |
| | Purchasing | 277,742.93 | |
| | Payroll | 145,919.38 | |
| | Land | 48,570.09 | |
| | General | 1,885,509.56 | |
| | Total overheads | | 3,194,412.95 |
| (d) | Interest during construction | | 630,714.83 |
| | Total | | $18,528,017.22 |

## Statement 3

### Detail of Direct Material and Labor Costs Excluded from F. P. C. Examiners' Adjusted Book Cost

| | Description | Costs |
|---|---|---|
| (a) | Abstracting or recording costs for 125 deeds | $ 2,670.16 |
| (b) | Obtaining, recording or abstracting costs for 5,539 leases | 120,887.05 |
| (c) | 24 Rights of Way consisting of consideration, damages or obtaining costs | 3,133.30 |
| (d) | 122 wood frame houses, 6'11" x 6'8" x 7'2" average size, and 1,386 wood frame boxes, 4'6" x 3'3" x 2'11" average size | 17,235.46 |
| (e) | 275 buildings ranging in size from 4'2" x 5'6" x 7'5" to 30'4" x 20'6" x 7'7" consisting of warehouses, barns, garages, blacksmith shop, wagon sheds, tool houses, storage buildings, wash houses, etc.<br>686 miscellaneous structures consisting of sidewalks, pits, bridges, fences, pipe skids, pipe racks, etc.<br>1,574 miscellaneous items such as electric lights, plumbing fixtures, drain outlets, painting, water, sewer and drain lines, hardware, roofing, ventilators, electric wiring, sand, cement and stone to complete structure | 293,374.32 |
| (f) | Drilling and other well construction costs for 2,633 wells | 12,643,641.57 |
| (g) | Construction costs for 803,389 feet of pipe lines ranging in size from 1" to 20" | 229,310.08 |
| (h) | Material and installation costs for 2,945 benches, racks, heaters, cabinets, tables, truck flat beds, accessory items, etc.<br>Installation costs for 2,759 items consisting of meter connections of orifice, positive and free consumer meters, miscellaneous equipment such as blueprint machines, brass railing, chain hoists, forgers, motors, air compressors, drip tanks, etc.<br>2,408 law books | 114,213.79 |
| (i) | 752 installation costs for auxiliary equipment units, consisting of tanks, pumps, motors, transformers, engines, turbines, gas coolers, scrubbers, compressor cylinders, air compressors, boilers, traveling cranes, etc.<br>Installation costs for pipe and fittings ranging in size from 2" to 30", valves ranging in size from 2" to 20"<br>Installation costs for miscellaneous items, such as floodlights, flow meters, damper regulators, etc. | 135,078.44 |
| (j) | 9,584 telephone poles with cross arms, brackets, pins, insulators, etc. | 80,640.63 |
| (k) | Difference between direct material and labor costs (exclusive of well construction) to other utilities and F. P. C. Examiners' Adjusted Book Cost for properties acquired as operating units from other utilities | 383,610.90 |
| | Total (as shown on Statement 2, item (a)) | $14,023,795.70 |

## WRITTEN STATEMENT OF GEORGE I. RHODES.

### 1. Scope of this Exhibit.

In a separate Company exhibit there is set forth in summary form and in detail the reproduction cost new as of December 31, 1938 of the Company's production property, its transmission property and its general property with certain exceptions therein named. This exhibit describes the methods used in determining the depreciation accumulated in that property.

In general the depreciation accrued or accumulated in the property was determined from an extensive and painstaking examination of the property as hereinafter set forth. However, because of the natural limitations of the practicable methods of inspection and to make full allowance for any and all depreciation that exists in fact the percentages of accrued depreciation determined from observation have been increased appropriately wherever necessary.

The attached summary sets forth by accounts the reproduction cost new, the per cent depreciation found to have accumulated in the property, the amount of this depreciation, the per cent condition and the reproduction cost new less depreciation.

### 2. Depreciation Accumulated in Gas Wells.

The depreciation accumulated in the Company's gas wells was determined from the proportionate decline in useful rock pressure from the time the well was drilled (initial

—3—

pressure) to a lower pressure at which a well may be considered to be exhausted (abandonment pressure). The initial pressures of all operating wells were determined from the Company's records by the Company's geologist. He fixed the average abandonment pressure at 100 pounds per square inch for the Benson and Speechley sands and at

30 pounds per square inch for all other sands. The December 31, 1938 rock pressures were based on the 1938 pressure gaugings taken in the fall of that year as shown by the Company's records.

The per cent condition of each producing sand in each well was determined as the ratio of (a) the excess of the 1938 rock pressure above the abandonment pressure to (b) the excess of the initial rock pressure above the abandonment pressure. The per cent condition of each well was determined as the numerical average of the per cents condition of the sands in that well considering exhausted sands as being in zero condition. The condition of the Company's wells as a group was determined as the numerical average of all the per cents condition of the individual wells.

The per cent condition of Account No. 332-1, Producing Gas Wells—Well Construction, was taken as the average per cent condition of all the wells so determined.

The per cent condition of Account No. 332-2, Producing Gas Wells—Well Equipment, was determined from the gross salvage of equipment, the cost of abandoning wells and the per cent condition of the wells. In determining the per cent condition of this well equipment account the excess of the cost new of the well equipment over and above the net salvage was depreciated in the proportion of the per cent condition of the wells as a group.

* * * * *

[Details of determination of gross salvage, cost of abandoning, and net salvage are omitted.]

—5—

During the life of the well the cost of well construction is depleted from 100 per cent to zero, but the equipment depreciates only to the net salvage or to 36.6 per cent. Thus when a well is fully depleted the loss in equipment is only 63.4 per cent of the total equipment cost. At any condition of the well the per cent depreciation in the equipment is therefore 63.4 per cent of that in the construction.

Taking into consideration the above matters, depreciation was found in the Company's gas wells as follows:

| | Gas Well Construction | Gas Well Equipment |
|---|---|---|
| Total depreciation | 68.7% | 43.6% |
| Corresponding condition | 31.3% | 56.4% |

**3. Depreciation Accumulated in Pipe Lines.**

* * * * *

[Detailed description of field inspection of pipe at 554 locations is omitted.]

—7—

The depreciation was determined from a consideration of the field inspections above described. The records of the field work were tabulated and summarized. They were subject to study and analysis both scientific and practical. Consideration was given to the many factors affecting depreciation through corrosion which are described in the succeeding paragraphs.

Renewals of pipe are most commonly the result of a troublesome succession of leaks caused by corrosion. As leaks occur they are stopped by bolting band clamps around the pipe with a rubber packing over the leaks. Sometimes two or more leaks develop at widely separated dates on the same joint of pipe. The development of leaks first occurs in stretches of lines where for various reasons local condi-

—8—

tions are favorable to corrosion. These are called "hot spots" and range from a few joints to thousands of feet in length. When the leaks begin to develop with troublesome frequency not only is the pipe in the "hot spot" itself renewed but also pipe for an appropriate distance on either side. In practice the worst joints of pipe may have two or more leaks. Stretches of pipe 100 feet long may contain five to ten leaks and other stretches of 100 feet may have no leaks at all. Some of the pipe is suitable for reuse with

a simple cleaning operation, some requires welding up the pits before it can be reused and other pipe is reduced to junk value.

The progress of corrosion has universally been found to fall off with age. When pipe is first buried it starts to corrode rapidly. As time goes on the intensity of corrosion slows down. The field inspections of the Company's major pipe lines were specially studied to determine the Company's experience in this connection. It was for this reason that more inspections were made on the long large lines than on other lines and that many inspections were made on new lines to insure adequate data on corrosion in its early stages. It was found from this study that the corrosion of the Company's pipe slows down to such an extent that doubling the time the pipe has been in place results in less than a 50 per cent increase in pit depths.

It is also the universal experience that the greater the lengths of pipe examined on inspection the greater will be the average depths of the deepest pits found. This is illustrated by the fact that the average depths of the deepest pits found on the 554 three foot sections of the Company's pipe inspected in 1939 were 10 per cent greater than the average depths of the deepest pits found in the 1108 eighteen inch sections. A study of the relative depths of the deepest pits in the 18 inch sections was made in conjunction with the deepest pits in the 3 foot sections from which was determined by scientific analysis the average depths that could be expected in greater lengths of the Company's pipe—20 foot, 40 foot, or 50 foot—as the case might be. This study also determined the number of pits required to be welded in reconditioning.

Through a correlation and application to the field inspections of the rules of corrosion outlined above by the use of proper engineering methods it was determined that the production system pipe lines of the Company had pro-

gressed through corrosion towards complete depreciation by 22.5 per cent and that the transmission system pipe lines of the Company had progressed through corrosion towards complete depreciation to the extent of 20 per cent. To insure the inclusion of all depreciation existing in fact in the lines the above percentages were increased to 26% in the production system pipe lines and to 21% in the transmission system pipe lines. While these inspections were made in the spring and early summer of 1939 they fairly represent the accrued depreciation as of December 31, 1938.

**4. Depreciation Accumulated In Compressor Station Equipment.**

The wear and tear and other deterioration that has developed in the compressor station equipment was determined from a detailed field inspection of all of the main units and a more general but complete inspection of the many units of auxiliary and miscellaneous equipment. Particular attention was given to the wearing parts such as power and compressor cylinder assemblies, valves and

valve gears and the like. The condition of each important wearing part was determined and recorded in the field. The field reports were summarized, analyzed and studied, and determinations made of the over-all physical condition of the equipment in each compressor station.

In determining the condition of this equipment consideration was given to the fact that the greater part of the cost of the equipment is in non-wearing parts which are subject to replacement only as a result of an accident. The over-all rating of any particular unit was determined by giving weight to the condition and the relative contribution to cost of the wearing parts and the existence of any defects in the non-wearing parts which had been damaged by accidents or otherwise. In determining the condition of boilers not only were they inspected but several years'

insurance inspection reports were taken into consideration. It was not reasonably possible to inspect buried equipment such as foundations, piping, etc. and such equipment in each station was rated at the average condition of all the equipment in that station. The yard piping was rated as being in the same physical condition as transmission line piping. The over-all physical condition of each station was arrived at by giving weight to the relative cost of the equipment separately rated on inspection.

A few stations contain equipment which has not been used for a period of years but which is available for movement to and re-erection at other locations as required. In stations containing this equipment, its cost installed has been depreciated to the cost of the equipment itself as though carried in a warehouse. In other stations equipment of types being gradually retired by the Company or

—11—

susceptible of modernization through retirement and replacement of parts has been appropriately depreciated.

The observed depreciation accumulated in the equipment in each compressor station was determined by a consideration of the factors outlined above. It was found that in the aggregate the Company's compressor station equipment had depreciated 17 per cent. To insure the inclusion of all the depreciation existing in fact in the compressor station equipment the above percentage was increased to 19 per cent. While these inspections were made in the fall of 1939 they fairly represent the accumulated depreciation as of December 31, 1938.

**5. Depreciation Accumulated In Buildings And Structures.**

The deterioration existing in buildings costing more than $1000 each was determined in general by a detailed inspection of each of the buildings in the field. These buildings aggregate some 470 in number and constitute about 71 per cent of all the Company's structural property. Mis-

cellaneous improvements aggregating a further 19 per cent of all the Company's structural property were separately inspected to the extent of about one-half in value, the remainder being largely underground. The deterioration in the smaller buildings, some 2670 in number, was determined by an extensive sampling and individual inspection of about 20 per cent of these smaller buildings. In this field inspection the various parts of the larger buildings and structures such as visible foundations, walls, framework and roof were separately rated as to physical condition. The smaller buildings were inspected in less detail appropriate to their lesser costs.

The field inspections were tabulated and summarized and the condition of the buildings determined in groups such as those at each compressor station and the like. In determining the depreciation existing in these buildings be-

—12—

cause of deterioration, there was taken into account the depreciation found to exist in the various parts, the relative extent to which these parts contributed to the whole cost of the structures and the relative extent to which the individual groups of structures contributed to the whole cost of the group. Incidental details of the structures were taken as being in the same condition as the structures themselves.

Certain buildings soon to be retired were depreciated to gross salvage. Generally such buildings shelter equipment available for movement to other locations. The known early abandonment of certain structures or parts thereof was appropriately allowed for.

The observed depreciation accumulated in the buildings and structures of the several accounts both as found and as adjusted to insure the inclusion of all the depreciation existing in fact are shown below.

| | Observed Depreciation | Total Depreciation |
|---|---|---|
| Gas Well Structures | 40% | 44% |
| Field Measuring and Regulating Station Structures | 44 | 49 |
| Other Production System Structures | 39 | 43 |
| Compressor Station Structures | 25 | 28 |
| Transmission System Measuring and Regulating Station Structures | 37 | 41 |
| Other Transmission System Structures | 27 | 30 |
| General Structures | 26 | 27 |

The inspections of property on which the above percentages are based were made in the fall of 1939, but they fairly represent the condition of the property as of December 31, 1938.

—13—

**6. Depreciation Accumulated In Measuring And Regulating Station Equipment.**

The depreciation accumulated in measuring and regulating station equipment both production and transmission was determined by inspections in the field and by a consideration of the Company's records related to the retirement and depreciation of such property.

Installations of meters and regulators were conditioned for physical depreciation by taking into consideration their condition of maintenance found by inspection and the fact that the greater part of the total cost of such equipment consists of parts which are replaced for causes other than deterioration. The buried pipe in the production system meters and regulators was taken to be in the same physical condition as the production system pipe lines and the buried pipe in the transmission system installations was taken to be in the same physical condition as the transmission system pipe lines. It was found that the total observed

deterioration existing in meter and regulator equipment was 19 per cent for the production equipment and 22.5 per cent for the transmission equipment. To insure the inclusion of all depreciation existing in fact in such equipment, the above percentages were increased to 21 per cent in production meter and regulator equipment and 27 per cent in transmission meter and regulator equipment.

—14—

**7. Depreciation Accumulated In Communication Equipment.**

The depreciation accumulated in communication equipment was determined from an inspection of the property in the field. By a sampling method approximately 1,000, or 5 per cent, of the Company's poles were inspected as to condition at reasonably accessible locations. At each point of inspection the poles, fixtures, insulators and supporting wire were separately rated as to their condition. All of the station equipment was inspected in the field.

It was found that the deterioration existing in the communication equipment is 27 per cent. To insure inclusion of all depreciation existing in fact the deterioration as found was increased to 32 per cent. The inspections were made in the summer of 1939 but they fairly represent the condition as of December 31, 1938.

**8. Depreciation Accumulated In Transportation Equipment.**

The depreciation accumulated in automotive equipment was determined from a study of the records of 155 automobiles and 131 trucks operated and disposed of by the Company from 1925 to 1938, inclusive, as compared with the 77 automobiles and the 76 trucks owned as of December 31, 1938. These records show that the mileage at time of turn-in has increased materially within the past ten years, as well as the percentage of cost recovered at the time of turn-in. This experience of the Company is in accord with

—15—

the universal experience as to the improving quality of automobiles and trucks available in the market. Taking into account this steady improvement in automotive equipment as to mileage and turn-in ratio and the average mileage of automobiles and trucks at December 31, 1938, it was found that the automobiles in the aggregate were 36 per cent depreciated and the trucks in the aggregate 50 per cent depreciated as of December 31, 1938. The condition of the other transportation equipment amounting to about one-eighth of the whole account was determined in various ways appropriate to the class of equipment, and was found to be 42 per cent depreciated. Transportation equipment in the aggregate was found to be 44 per cent depreciated or in 56 per cent condition.

**9. Depreciation Accumulated In Miscellaneous Property Accounts.**

The major accounts including gas wells, pipe lines, compressor equipment and structures constitute about 95 per cent of the Company's properties subject to depreciation. The methods of determining the depreciation accumulated in the property constituting these accounts have been described above in considerable detail. There have also been described above the methods of determining depreciation accumulated in four minor but diverse types of property aggregating about 1 per cent of the remaining 5 per cent. The depreciation accumulated in the other miscellaneous property accounts covering about 4 per cent of the depreciable property has been determined by similar methods appropriate to the respective classes of property. The same care has been exercised in determining the depreciation of these accounts as has been used in the major

—16—

accounts and described above. The condition of these various accounts is shown in the summary, which is attached.

**10. Depreciation Accumulated In Undistributed Construction Costs.**

In the Company exhibit setting forth the estimated cost of reproduction new of the Company's properties, allowances for undistributed construction costs were adopted which as there explained had repeatedly been used by agreement before the Public Utilities Commission of Ohio and adopted by that Commission in its findings relative to the Company's property. These allowances aggregated 17.72%.

These agreements, above referred to, reached by representatives of The East Ohio Gas Company and representatives of the City of Cleveland in the 1931 East Ohio-Cleveland case and with representatives of the City of Akron in the 1932 East Ohio-Akron case, included also agreements relative to the extent to which these undistributed construction costs depreciated with the property. It was agreed in both cases that those undistributed construction costs to the extent of 11.51% depreciated with the Company's property and the Ohio Commission so found in the 1932 Akron and the 1937 East Ohio-Cleveland cases. In the 1931 Cleveland case the Commission made no findings as to depreciated cost of the Company's property except as to pipe lines.

In view of the repeated use of the above percentage of depreciating undistributed construction costs by engineers representing the various parties to rate controversies involving this same property and by the Ohio Commission in its findings related thereto, this same percentage has been used in this exhibit. Such allowance for the depreciating undistributed construction costs is fair and reasonable.

—17—

**11. Summary**

The estimated cost of reproduction new of the Company's properties here considered as set forth in the separate Company exhibit previously referred to and this re-

production cost new less depreciation determined as described in this exhibit, all as of December 31, 1938, are summarized by accounts on the attached statement which shows:

| | |
|---|---|
| Reproduction cost new as of December 31, 1938 | $94,973,856 |
| Depreciation accumulated as of December 31, 1938 | 32,774,442 |
| Reproduction cost new less depreciation as of December 31, 1938 | $62,199,414 |
| Per cent of depreciation accumulated | 34.51% |
| Corresponding per cent condition | 65.49% |

SIGNED at Clarksburg, West Virginia, this May 16, 1940.

GEO. I. RHODES.

## 14. TESTIMONY OF COMMISSION WITNESS CHARLES W. SMITH AS TO PRINCIPLES OF DEPRECIATION, WEDNESDAY, APRIL 23, 1941, RECORD PAGES 2826 TO 2850.

—2826—

Whereupon, CHARLES W. SMITH resumed the stand and testified further as follows:

DIRECT EXAMINATION by Mr. Springer.

Q. Mr. Smith, you testified on the principles of accounting yesterday, did you not? A. I did.

Q. And you made a statement of qualifications. Have you had any experience in connection with determining depreciation expense and accrued depreciation, and if so will

—2827—

you please describe it briefly? A. I have been actively dealing with depreciation matters since 1920. When I was in the Income Tax Unit of the Internal Revenue Bureau, I necessarily passed upon depreciation claims in numerous, probably hundreds, of cases. In fact, as I look back upon it, it seems that almost every large case involved depreciation in one manner or another. When I was in the employ of the Public Service Commission of Maryland, one of my duties was to pass upon matters of depreciation expense and the depreciation reserve.

Since joining the staff of the Federal Power Commission, I have taken an active part in the functions of the Commission as relating to depreciation. Here again, depreciation is involved in almost every rate case. Thus, since 1920, I have been constantly applying depreciation principles, have been determining service lives, depreciation rates, depreciation expense and accrued depreciation. In addition, I have been a close student of public utility depreciation matters and have taken a very active part in

the work of the Committee on Depreciation of the National Association of Railroad and Utilities Commissioners.

Q. Have you supervised in a general way the preparation of an exhibit showing depreciation and depletion of gas plant as of December 31, 1938, for the Hope Company? A. I have.

Incidentally, when I speak of depreciation hereafter,

—2828—

depletion will be included in the meaning of the term. For convenience, in other words, both depreciation and depletion will be spoken of as depreciation.

Q. And the exhibit referred to shows the annual and accrued depreciation and depletion as related to the original cost of the gas plant of the Company, does it not? A. It does.

Q. Are there two phases to the depreciation problem? A. There are. One phase relates to depreciation expense, and the other phase relates to depreciation in the properties as of a particular date, the latter being referred to as accrued depreciation.

Q. Is the purpose of depreciation accounting to determine, as reasonably accurately as possible, another element of the cost of service for a given period? A. Yes, that is true.

Q. What do you mean by the word "depreciation"? A. Depreciation signifies the expiration or consumption, in whole or in part, of the service life, that is, the economic life or utility, of depreciable property resulting from the action of one or more of the various forces which operate to bring about the retirement of such property from service. Among the forces so operating are wear and tear, decay, action of the elements, inadequacy, obsolescence, and public requirements.

—2829—

Q. Is depreciation wear and tear? A. No, depreciation is not wear and tear. Wear and tear is simply one of

the forces which operate to bring about the retirement of property.

Q. Is depreciation inadequacy? A. No, inadequacy is also only one of the forces which operate to bring about the retirement of property.

Q. Is depreciation obsolescence? A. No, true depreciation is not obsolescence. Again, obsolescence is merely one of the forces which bring about the ultimate retirement of property.

Q. Will you please explain the difference between depreciation per se and the forces bringing about the retirement of property? A. All physical property of a utility, except certain land, will come to the end of its useful or economic life. If it did not come to the end of its economic life, if its life, in other words, were perpetual, there would be no depreciation. The force or forces causing the ultimate retirement of property are usually classified into two broad categories, such as physical and functional. Wear and tear, or deterioration, is the chief physical cause of retirement, whereas inadequacy and obsolescence are the chief functional causes.

Sometimes, of course, several causes of retirement are acting simultaneously. Depreciation, however, is not syn-

—2830—

onymous with retirement or with the cause of retirement. Depreciation results, as I have indicated, because the properties will not last forever. Depreciation, itself, is the diminution, the lessening, or the reduction in the service life of properties.

Service life is the same as economic life, the utility of property, or the over-all work it will do or what it will yield during its useful life in service. Depreciable assets are, therefore, no more than stored-up services. The purchase of a gas well is the purchase of so much gas in the ground. The purchase of an automobile is, in reality, the purchase of so many automobile miles or automobile hours of service.

The purchase of a building is the purchase of so much shelter. The purchase of a gas transmission line is the purchase of so much transmission service. The purchase of capital goods, in other words, is the purchase of future service. This is obviously so, for otherwise capital goods would have no economic value. As Professor Taussig classically remarked, "the printing press ripens into books."

Plant costs are incurred to make production possible. The use of plant results in some sort of production, and this production reduces to possession some of the over-all stored-up service, over-all yield of work units.

As service is performed, a corresponding part of the cost of plant—that is, the cost of stored up services—should be charged as an expense of doing business—depreciation expense.

—2831—

As this service capacity, or utility, or economic life, or service life, which Professor Paton calls a "bundle of services," is used up, depreciation occurs regardless of the cause of final retirement. The present fact of depreciation does not vary because of the nature of the ulfimate retirement. Only the fact of ultimate retirement and the time of retirement are important. The final retirement may be due to deterioration, exhaustion of natural resources, inadequacy, obsolescence, or some other cause, but the cause of ultimate retirement should not be confused with depreciation itself, which is a diminution in service life.

To illustrate this point, if a certain gas well will produce one million cubic feet of gas during its useful life, and if the well has no salvage value, then every time a thousand cubic feet of gas is removed, a proportionate part of the economic or service life of the well has been consumed or has expired. This results in depreciation and depletion. Each unit of production,—and I use production in the broad sense of service,—reduces the utility or the over-all yield of the item and reduces the economic worth. This reduction is depreciation.

Q. Then what you have said supports the unit-of-production method of computing depreciation, Mr. Smith? A. Yes, theoretically, it does, and actually that method has been applied in the instant case to as large a part of the

—2832—

property of the company as is feasible. In other words, certain of the costs, such as the cost of well construction and the cost of laying field lines, are depreciated on the basis of production. It is not practical, however, to apply that method to many other items of plant. It is very seldom possible to apply the unit-of-production method to a large part of the properties of a public utility. The reason is that sufficient data necessary to apply the unit-of-production method are not available, and could not be made available without the expenditure of large sums of money, and it is doubtful if the data could be made available even by that means, and the result would not likely vary greatly from results which obtain from the use of the straight-line method. The straight-line method is the nearest approach to the unit-of-production method for a utility, in my opinion. That method emphasizes the time element. There is very good reason for the application of the straight-line method to public utility properties, for the service or economic life does have a direct relationship to the expiration of time, and because public utility operations are relatively stable compared with other business enterprises.

I might add, too, that the straight-line method is used far more than any other depreciation method. In fact, no other method comes even close to having the widespread application of the straight-line method.

Q. Well, Mr. Smith, what, in your opinion, is "actual

—2833—

existing depreciation"? A. Actual existing depreciation is the expired, diminished, or consumed service life, which I also term the economic life, of a utility's depreciable plant.

Q. How, in your opinion, should actual existing depreciation be determined? A. First of all, it is necessary to estimate the over-all service life of the various property items. In making this estimate, resort should be had to a thorough field inspection of the property and then consideration should be given to all other available data, such as life tables, mortality curves, retirement experience of the company, et cetera, which may have a bearing on the problem.

After service lives have been determined, they are converted into depreciation rates. These rates should then be applied to the cost of properties so as to determine that part of the cost which is associated with the expired, consumed, or diminished service life. This means that a properly computed depreciation reserve will be determined from the depreciation rates. In other words, a properly computed depreciation reserve measures, in my opinion, the actual existing depreciation on a cost basis, for it measures the cost of the economic life which has expired, or which relates to past transactions.

It was the practice at one time to charge off the plant

cost directly as depreciation occurred rather than indirectly through the use of a depreciation reserve. It should be borne in mind that the reserve for depreciation is simply a complement to the plant account. It is a part of the plant account, being contra thereto.

Q. In your opinion, is so-called "observed depreciation" "true depreciation?

Mr. Cockley: To which question the respondent objects on the ground that the witness has shown no qualifications to answer it, it being, as I understand it, a strictly engineering question.

Mr. Springer: It is hardly strictly an engineering question that hasn't come to Mr. Smith's knowledge in his 20 years of appraising depreciation studies. He is certainly entitled to an opinion on it.

Mr. Cockley: May I interrogate him briefly upon his qualifications?

Trial Examiner: Well, I doubt that that will be necessary. There has always been a question in my mind as to whether it was either strictly an engineering problem or strictly an accounting problem, and I have often wondered just what kind of an expert you might put on the stand to testify with respect to that. If you wish to go into Mr. Smith's qualifications in that respect, you may do so.

Mr. Springer: Could that be reserved until he has an-

—2835—

swered my question? He is amply qualified to assert his opinion on such a depreciation study as the so-called observed depreciation.

Trial Examiner: Of course, the question has been raised as to whether he is or not. I think perhaps we might postpone the answer to the question until Mr. Cockley has had an opportunity—

Mr. Springer: (Interposing) He has already testified that he has spent 20 years in appraising depreciation studies, and that he himself has determined service lives and the annual depreciation expense.

Trial Examiner: Well, I am satisfied as to the witness' qualifications, but you realize, of course, that Mr. Cockley is making up a record here, and he is entitled to develop those qualifications on that.

Mr. Cockley: Am I right, Mr. Smith, that your experience with depreciation in the past has been as an accountant?

The Witness: Not exclusively, Mr. Cockley.

Mr. Cockley: Are you an engineer?

The Witness: No, sir.

Mr. Cockley: Have you had any engineering experience at all?

The Witness: I have charge of a certain engineering group, they work under my direction. I have studied the phases of engineering which relate to regulation, certainly

—2836—

for the last 12 years or more.

Mr. Cockley: Will you define for me exactly what you mean or what you understand by so-called "observed depreciation" as used in the question put to you?

The Witness: You go out and look at the properties; you measure the deterioration as far as you can, you measure the pitting in pipes, you observe the physical condition of structures and equipment, you take into consideration all of the defects which are visible to the eye, you take into consideration all of the inadequacy or obsolescence which is visible or effective as of that time, and you convert that into a condition per cent.

I have accompanied field parties in making such studies. I very frankly think that they are worthless.

Mr. Cockley: Well, just a minute. What you think about it isn't the question.

Did you ever have to determine, yourself, the condition of any part of a gas plant or other property based on that?

The Witness: The condition is not depreciation, no, sir.

Mr. Cockley: Or the amount of existing depreciation in it, or how much its service life has expired? Did you ever have to do that as a practical matter?

The Witness: I think we have done it here, a group of us—

—2837—

Mr. Cockley: (Interposing) Just a minute—

Mr. Springer: (Interposing) Permit the witness, please, to finish his answer.

Mr. Examiner, I think the witness should be protected from this interjection of question after question before he completes his answer and explanation.

Mr. Cockley: You are the one that is interrupting him now.

Mr. Springer: I am protecting him now.

Trial Examiner: Well, I really don't think the witness needs much protection, as far as that is concerned.

Mr. Cockley: I haven't observed that he did.

Go ahead and make your explanation.

The Witness: What I wanted to say was that Mr. French, of the Division of Gas Engineering, determined the service lives from a thorough inspection of the property. My staff worked in very close association and collaboration with Mr. French, and we applied his service lives or depreciation rates, so that in this particular case I have not determined the depreciation rate element which goes into the determination of expired service lives.

Mr. Cockley: Isn't—

The Witness: (Interposing) But I say a group of us have done that job.

Mr. Cockley: Mr. Smith, isn't it a fact that you

—2838—

couldn't, yourself, go to any piece of machinery in the Hope Company's property, or pipe line, and tell from an inspection, or otherwise, when that property's service life would end, or had ended?

The Witness: If it had ended, certainly I could tell.

Mr. Cockley: Well, you could tell because some practical gas man told you that this engine was no longer useful?

The Witness: That is probably so.

Mr. Cockley: And you couldn't—

The Witness: (Interposing) You asked me two questions before.

Mr. Cockley: Answer the other one, then.

The Witness: You asked me whether I could tell the future life. I think by making a study of all the information available I could tell the future life. I have done it in many instances.

Mr. Cockley: Could you look at a compressor and tell whether it was in good operating condition or not?

The Witness: I wouldn't attempt to.

Mr. Cockley: Could you tell by looking at a compressor engine how much of its useful service life—if you had all the information, now, that an engineer could get—could you tell how much of its useful service life had expired?

The Witness: I wouldn't want to do that, and I haven't done it here.

—2839—

Mr. Cockley: You couldn't do that, you don't feel qualified to do that, is that right?

The Witness: I wouldn't want to attempt it.

Mr. Cockley: And isn't the most important factor you take into consideration, in determining the service life, the amount of service life that has expired in an item of property at the time it is observed?

The Witness: Well now, we do, but that is not usually done in observed depreciation; that is, our method—

Mr. Cockley: (Interposing) Well, isn't that a fact, that your engineer has to go and consider all the facts that his observation and investigation show him, and determine how much of the service life has expired up to a given date? Isn't that right?

The Witness: No, he doesn't do it that way. In effect he gets that answer, but what he does is to determine an over-all service life and then, by knowing the age of the property, he can get the amount expired.

Mr. Cockley: Isn't it a fact, Mr. Smith, that what he does is determine the amount of the service life that has expired in a given number of years, and project that in the future?

The Witness: No, indeed, that is wrong. First of all, to get the right answer, he must project the over-all service life to get the proportion which has expired,—he can't get the proportion expired unless he knows the over-all life.

—2840—

Mr. Cockley: You have to determine the over-all, first?

The Witness: That is the only real way to do it.

Mr. Cockley: And you don't use at all the condition of the property that he finds it in after 20 years of service to prognosticate how much longer it is going to last?

The Witness: Yes, indeed, you do.

Mr. Cockley: That is exactly what you do?

The Witness: Yes, to get the over-all life.

Mr. Cockley: And that observation and that determination is an engineering question, isn't it, primarily?

The Witness: We have treated it so here.

Mr. Cockley: All right.

I object to this witness expressing any comments on whether, in his opinion, so-called observed depreciation is true depreciation in view of the fact, as he has just stated, that the essential thing in it is an engineering determination.

Trial Examiner: The objection is overruled.

Mr. Cockley: Note an exception.

The Witness: In the cases with which I am familiar, and I have studied a great many cases involving observed depreciation, observed depreciation was not true depreciation. I do not believe true depreciation can possibly be determined by observation alone, because I do not believe by observation alone the expired service life can be de-

—2841—

termined. Observation and field inspection of physical properties should be resorted to for the purpose of aiding in the determination of service lives, that is to say, depreciation rates, and these in turn are used in determining the exhausted service life. Observation should not be resorted to for the purpose of determining directly from the physical condition of property the depreciation therein. To repeat, field inspections are most important, but their importance lies in the determination of service lives in

order that true depreciation, which is the diminished, consumed or expired service life, may be computed.

By Mr. Springer:

Q. Mr. Smith, in a gas company where much of the property is underground and not visible, would it be possible for anyone to go out and inspect the property and reach an accrued depreciation answer, if he had no other information than his inspection notes?

Mr. Cockley: I object. That is a theoretical question that relates to a form of inspection to determine a condition, which nobody, so far as I know, has employed in this case.

In addition to that, it calls for an engineering opinion which this witness is obviously not qualified to express.

Mr. Springer: He is certainly entitled to an opinion on this subject, and that is just what Mr. Rhodes did when he had 40 or 50 men look at the property and take samples

—2842—

and come in with some sort of an accrued depreciation percent. I am asking him whether or not he knows anybody who has X-ray eyes who can tell how much depreciation exists in a property when most of it isn't visible.

Trial Examiner: You asked him if anybody could do it, not if he knew anybody.

Mr. Cockley: I object to counsel's characterization of what Mr. Rhodes did, because it is just as inaccurate as to call "black," "white."

Wholly aside from that, if this witness wants to be used as a rebuttal witness to Mr. Rhodes' depreciation study in his determination of percent condition, then he ought to take up his exhibit in a logical way and present it, and not come in with some general comment as to what he generally thinks about this assumed situation, which doesn't exist here at all. It is plainly an improper question.

Trial Examiner: Will you read the question again, please?

(The question was read by the reporter.)

Mr. Cockley: There is no such case here.

Trial Examiner: Well, I am concerned about the ability of the witness to testify as to what it is possible for somebody to do. The objection is overruled.

Mr. Cockley: Note an exception.

The Witness: I presume it would be possible to go out and dig up all the pipe and see it. That usually isn't done.

—2843—

In practice, sample studies are made. It is my opinion that these sample studies are not sufficient to show the actual existing depreciation of the properties, because they are not sufficient to enable a determination of the exhausted service life.

Mr. Cockley: I move that the answer be stricken on the ground that the last half of it is not responsive to the question.

Trial Examiner: It seemed to me that the last half was more responsive than the first.

Mr. Cockley: Then I move to strike it all out.

Trial Examiner: The motion is overruled.

Mr. Cockley: Exception.

By Mr. Springer:

Q. Mr. Smith, I believe you said that it wasn't possible to see the inside of much of the gas company's equipment. Is it important to know the age of the various classes of property so far as that can be ascertained? A. Yes, it is important to have knowledge of the age of property in computing the expired service life.

Q. And is it important to know the retirement experience of the company for various classes of property? A. Yes, that retirement experience of the company is one of the factors that ought to be taken into consideration in determining service lives.

—2844—

Q. Is it important to study the maintenance policies and practices of the company? A. Yes, of course.

Q. From your former testimony, then, you believe that properly computed depreciation reserves measure the actual depreciation in properties? A. Yes, that is correct, assuming now we are speaking of a cost basis. It is correct, for in my opinion, a properly computed depreciation reserve measures, as best can be measured, that part of the bundle of services we call plant, which has been used up.

Q. Now, Mr. Smith, in your discussion of the principles of depreciation and the definitions that you have given, are they consistent with the definitions of depreciation and depletion in the Federal Power Commission's Uniform System of Accounts for Natural Gas Companies?

Mr. Cockley: I object to that. Plainly, if they want to prove what these are, they should introduce the exhibit and let it speak for itself, and not ask the opinion of the witness as to whether what he has done is, in his opinion, consistent with it, when they can safely wait until there is an attack on him on that basis.

Mr. Springer: Mr. Examiner, he is certainly entitled to state whether or not his testimony is consistent with the definition in the System of Accounts which he is re-

—2845—

sponsible for interpreting.

Mr. Cockley: I never heard of such a suggestion in my life, for a witness to do that. Now he may testify, if he wants to, that the depreciation principles set forth in the Code of Accounts were the ones he instructed the engineers to follow. That would be perfectly proper. But to ask him if, in his opinion, his own testimony is consistent with that Code of Accounts is, to my mind, a conclusion of the witness, it is wholly unwarranted by anything I know, except in cross examination. It probably would be a proper

question for somebody to ask on cross examination as a foundation question, but to ask the witness himself whether, in his opinion, what he had done conformed to some depreciation Code of Accounts, or conformed to the Statutes of the State, or conformed to the Constitution of the United States, is wholly improper.

Mr. Springer: I haven't asked an expert witness for an improper conclusion. He is eminently qualified, and I have asked him whether or not the various definitions he has used in his testimony here are consistent with the precise wording of the definition in the System of Accounts. I can't see anything objectionable about that.

Trial Examiner: Well, of course, it certainly calls for a conclusion on the part of the witness.

Mr. Springer: I think expert witnesses make conclusions constantly, I think that is an accepted fact.

—2846—

Mr. Cockley: Not of that kind.

Trial Examiner: It is perhaps true that under the strict rules of evidence the question would be improper. I am satisfied that a good many that have been asked in this proceeding would certainly be; but of course, we don't follow those rules here, and I can't see where any particular harm might result from it.

The objection is overruled.

Mr. Cockley: Exception.

The Witness: Yes.

Mr. Springer: That is all from Mr. Smith at this time.

Mr. Cockley: We reserve the right to cross examine after we have had a chance to examine his testimony in a little more detail, but I would like to ask one or two questions now, that have occurred to me, if I may.

Trial Examiner: Surely.

CROSS EXAMINATION by Mr. Cockley.

Q. Did you assume that Mr. Rhodes, in the determination of accrued depreciation of the Hope Company's property, did or did not give consideration to age of various items of property which he was expressing an opinion about? A. I think, from reading his testimony, that he gave some consideration to age.

Q. And did you answer the questions you did on the

—2847—

assumption that he did not know and give weight to the retirement experience of the company, to various classes of property? A. What question are you referring to?

Q. Expressing your general opinion. A. I don't recall giving testimony on Mr. Rhodes' method.

Q. No, but in discussing generally the method of determining the depreciation, in response to questions that were put to you which were said to correctly reflect the method that had been used here, I am asking you whether you did or did not assume that Mr. Rhodes, in this case, knew the retirement experience of the company as to various classes of property? A. I made no assumption as to what Mr. Rhodes did. I did not testify as to Mr. Rhodes' methods. I knew that Mr. Rhodes did have knowledge of the retirement experience, that is quite evident in the statement he filed.

Q. In your comments upon observed depreciation, do I understand that you were not referring to Mr. Rhodes' testimony? A. I was speaking generally of observed depreciation studies.

Q. And you weren't referring specifically to the testimony in this case? A. That is correct.

Q. Now one other question.

—2848—

Mr. French, I believe, was the engineer who made the depreciation study, or determined the service lives of various classes of Hope's property? A. Yes, sir.

Q. Did you instruct him how to do it? A. Mr. French is not under my jurisdiction. I did have conversations with Mr. French, but I gave him no instructions.

Q. You gave him no instructions? A. That is right.

Q. Did you talk it over with him and explain fully your ideas about it, before he went to work? A. No, sir.

Q. You had talks with him about it before? A. I had talks with Mr. French toward the end of his studies, and I have had talks with Mr. French particularly since he prepared his exhibit.

Q. Had he arrived at any judgment as to lives of various classes of properties when you first talked to him? A. Yes, he had.

Q. And were those the lives that he subsequently used? A. Well, he may have made some changes, but he didn't make any changes as a result of my conversations, I am sure.

Q. Generally speaking, they were the lives you think he used? A. That is right.

—2849—

Q. Did you give him any directions at all, or discuss with him before he had completed his work, as to the things he should take into consideration in determining the service lives of those properties? A. I gave him no instructions. Toward the end of the investigation, I spent about a half an hour talking to Mr. French in the office of the Hope Natural Gas Company, and at that time we had some general discussion as to the determination of rates, but it was a general discussion only. I can't claim any contribution to Mr. French's study, Mr. Cockley.

Mr. Springer: Would it help you, Mr. Cockley, if I stated that the assignment for determining service lives was an engineering assignment to Mr. French from the division of Gas Engineering, headed by Mr. C. C. Brown; and that the service life determination was applied by men

under the direction of Mr. Smith in computing the depletion and depreciation reserve requirements.

By Mr. Cockley:

Q. Well, your testimony is that you did not discuss with Mr. French, prior to the time he substantially determined these service lives, the elements that he should take into consideration in determining service life, is that right? A. That is correct.

Now, Mr. Cockley, it is quite possible that at some time or other I may have had some conversation with Mr.

—2850—

French generally about depreciation matters, but they were no more than conversations that I might have had with any other member of the Commission's staff on that subject.

I don't recall anything specific in regard to that. In other words, I have done a good deal of work on depreciation, a good deal of writing on depreciation, and some of the members of the staff of the Commission occasionally come around and consult me; but I recall nothing specific in that connection relating to Mr. French.

Q. And that same thing is true with reference to other engineers who worked on depreciation? A. That is correct.

Q. Including both the gasoline plant study of Mr. Soyster and anybody else in the engineering department who worked on depreciation? A. That is true. As a matter of fact, I don't believe I have ever met Mr. Soyster.

Mr. Cockley: That is all.

15. **COMPANY'S EXHIBIT NO. 108 ENTITLED: "Photostatic Copy of Certified Copy of the Records of the Board of Public Works of the State of West Virginia Showing the Valuation of the Company's Properties Fixed for Taxation Purposes for the Year 1941" (Not Admitted).**

## ASSESSMENT OF PUBLIC SERVICE CORPORATIONS—1941

The Board took up the consideration of the assessment of the properties of the public service corporations for the purposes of taxation for the year 1941, i.e. water, light and power companies, bridge companies, telegraph and telephone companies, oil and gas companies, express companies, private car line companies, steam railroad companies, street railway companies, bus lines and bus companies, and all other companies doing business in the State of West Virginia, and assessable by The Board of Public Works, and upon a thorough examination of the returns made by said companies, and upon a separate vote of The Board taken upon the valuation in the State of each property assessed, with the right of any member of this Board to have his vote recorded at the time on the assessment of any particular property fixed the valuations of the properties owned by said companies in the State of West Virginia, for the tax-paying year 1941, as hereinafter set forth, and apportioned the same to the counties in which said property is located, as follows:

| County | Class No. 1 (Intangible Personal Property) | Class Nos. 3 & 4 (All other Property) | Total |
|---|---|---|---|
| **Gas, Oil and Pipe Line Companies** | | | |
| Hope Natural Gas Company | | | |
| Barbour | $ 20,600 | $ 265,200 | |
| Boone | 121,500 | 1,566,000 | |
| Braxton | 39,600 | 510,600 | |
| Brooke | 2,500 | 31,500 | |
| Calhoun | 223,300 | 2,877,700 | |
| Clay | 5,800 | 74,200 | |
| Doddridge | 341,200 | 4,398,400 | |
| Gilmer | 258,800 | 3,336,300 | |
| Harrison | 1,142,500 | 14,725,600 | |
| Jackson | 1,000 | 13,800 | |
| Kanawha | 230,400 | 2,969,400 | |
| Lewis | 622,300 | 8,020,300 | |
| Lincoln | 4,600 | 59,800 | |
| Logan | 2,300 | 29,700 | |
| Marion | 214,600 | 2,766,500 | |
| Marshall | 75,700 | 975,100 | |
| Mason | 600 | 7,600 | |
| Mingo | 100 | 1,100 | |
| Monongalia | 61,600 | 794,400 | |

| Ohio | 200 | 2,500 | |
| Pleasants | 42,000 | 541,500 | |
| Preston | 1,100 | 14,300 | |
| Putnam | 400 | 4,500 | |
| Raleigh | 300 | 3,400 | |
| Randolph | — | 200 | |
| Ritchie | 295,900 | 3,814,300 | |
| Roane | 53,600 | 691,500 | |
| Taylor | 11,200 | 144,000 | |
| Tyler | 115,300 | 1,486,000 | |

| | | | |
|---|---|---|---|
| Upshur | 3,500 | 45,600 | |
| Wetzel | 452,000 | 5,826,000 | |
| Wood | 134,200 | 1,728,600 | |
| Wirt | 4,200 | 54,000 | |
| | $4,500,000 | $58,000,000 | $62,500,000 |

. . . . . .

. . . . . .

STATE OF WEST VIRGINIA,
OFFICE OF THE SECRETARY OF STATE,
CHARLESTON, SS:

I, Wm. S. O'Brien, Secretary of State and Ex-Officio Secretary of The Board of Public Works, do hereby certify that the foregoing is a true and correct copy of the records of The Board of Public Works as touching the valuation of the properties of the Hope Natural Gas Company in the State of West Virginia for the tax-paying year 1941.

Given under my hand and the Great Seal of the said State, at the City of Charleston, this 3rd day of July, 1941.

WM. S. O'BRIEN,
*Secretary of State and Ex-officio Secretary of The Board of Public Works.*

## STATEMENT OF EXPERIENCE AND QUALIFICATIONS OF PERCY W. BROWN

**1. Name, address and age**

Percy W. Brown, 1040 Union Commerce Building, Cleveland, Ohio, age 53.

**2. Education**

Graduated from Harvard University in 1908 with degree of A. B.

**3. Present position**

General partner in the firm of Hornblower & Weeks, brokers and investment dealers, members of the New York, Chicago, Boston and Cleveland Stock Exchanges, and underwriters and distributors of industrial, public utility and railroad bonds and stocks. The firm maintains offices in nine cities: Boston, New York, Chicago, Cleveland, Detroit, Providence, Philadelphia, Portland and Bangor.

**4. Experience**

| | |
|---|---|
| 1909-1910 | Bookkeeper in the Boston office of Hornblower & Weeks. |
| 1910-1916 | Assistant statistician with Hornblower & Weeks. |
| 1916-1922 | Chief statistician of Hornblower & Weeks. |
| 1923 to date | General partner of Hornblower & Weeks; for the past 10 years member of the Executive Committee of the firm and member of the Buying Committee. Since March, 1924, resident partner in charge of the Cleveland office, and 1924-1930 partner in charge of a Pittsburgh office. |

My duties with Hornblower & Weeks have included the constant examination and analysis of many securities, both bonds and stock, the examination of various corpora-

tions with a view to purchasing and selling at retail large blocks of their bonds and stocks based on personal in-

vestigation and report to the other partners, the negotiation for the purchase of blocks of securities running into many millions and participation as a member of the firm in the purchase and sale of numerous security issues in very large amounts, both bonds and stocks, of industrial, utility and other companies.

Attached hereto as Schedule A is a list of the principal bond issues sold in 1938 and 1939 including generally only those issues of $5,000,000 and over. Hornblower & Weeks participated as an underwriter in 35 of the issues there shown and as member of the selling group in 41 additional issues there shown, including the Lone Star Gas debentures and Oklahoma Natural Gas 3¾% bonds shown on Schedules D and E hereto attached. Hornblower & Weeks were also co-underwriters in the public offering in June, 1936, of the first mortgage bonds and the convertible debentures and were members of the selling group for the public offering of the common stock in September, 1936, of the El Paso Natural Gas Company, Schedule G hereto attached.

I am a member of the investment committee of four endowed institutions. I have served as a director in more than 15 corporations with assets ranging from $3,000,000 to $50,000,000. I have been employed a number of times to give testimony in valuation cases for large blocks of securities—bonds, preferred and common stocks, both listed and unlisted; and both widely distributed and closely held. I have participated in various reorganization plans of corporations with a view to readjustment of the capital structure or with a view to getting new capital from the public. I have given advice on the relative merits and investment values of securities to many hundreds of individual investors over a period of more than 29 years.

## WRITTEN STATEMENT OF PERCY W. BROWN

### A. General Problem

I have been asked by the Hope Natural Gas Company to give my opinion as to what is a fair rate of return to be earned by it on a fair valuation of its natural gas properties.

For this purpose I have examined the income figures and balance sheets of the Company for the past ten years and have studied other material and data as to the history, organization and nature of the business of the Company. I am generally familiar with the territories served by it and have made such study and investigation as seems to me necessary to form a judgment as to the fair rate of return to be earned by it.

In approaching this problem I have assumed that the Federal Power Commission will find the fair value of the natural gas properties of the Company and will allow its necessary operating expenses and charges, including reasonable allowances for depreciation and depletion.

The importance to the general public of an adequate rate of return for public utilities is sometimes overlooked. The interests of every citizen of every community are adversely affected if that community has not adequate and efficient public utility service. Starved utility enterprises are a real detriment in any community, affecting living conditions, business opportunities and property values, among other things.

—4—

The construction and constant extension of efficient public utility enterprises must be financed by the permanent hiring of money, principally through the medium of bonds and stocks. This money comes in part from individual investors and in part through the savings of the public deposited in banks, paid as premiums to insurance companies

or contributions made to educational and philanthropic institutions.

Probably more than half of all our people have a vital interest in having their money hired to utilities at an adequate rate of return. All of them have a direct and vital interest in adequate and efficient utility service in their respective communities.

The problem of a fair rate of return therefore reduces itself to a decision as to the rate at which one large part of the public will be willing to hire its money to public utilities to enable them to serve another part of the public. To insure a steady flow of capital into the building and extension of public utility facilities the utilities must earn a rate of return that the investing public deems fair. If lower rates are prescribed by public authorities than the investing public deems fair they simply will not hire their money to public utilities. Deprived of this the utilities in the end will be unable efficiently to perform their function to the injury of everyone.

More specifically the problem reduces itself to one of what rate of earnings the Hope Natural Gas Company would have to enjoy at the present time on its natural gas

—5—

properties to enable it to replace the money invested in them. This requires a consideration of those factors that the investing public would consider and the terms upon which it would hire its money to the Hope Company.

## B. General Character Of The Hope Natural Gas Company's Business

Investors will only hire their money if they can receive a return commensurate with the risks and opportunities offered.

From the investors' viewpoint the natural gas business is probably the most hazardous of any of the public utilities. It sells a wasting asset. In the past many natu-

ral gas companies have come into existence and then passed out due to a failure of gas reserves. Throughout the Appalachian region gas reserves during the past 40 years have only been maintained by constant exploration and extension of the natural gas fields. The Hope Natural Gas Company itself has found it necessary constantly to extend its transmission system further and further south in West Virginia to bring into its lines either by production or purchase newly discovered fields. So far its business has not suffered appreciably from lack of adequate gas supplies but it is present in the minds of investors that this cannot always continue to be true.

Until recently the securities of manufactured gas companies have been favored by investors over those of natural gas companies for the very reason that the manufactured gas company, making the product it sells, is a much less hazardous undertaking than a natural gas enterprise. The recent change in the public attitude towards the securities of manufactured gas companies has been largely due to the discovery of large reserves of natural gas in

the west and southwest, to the development of long distance transmission lines bringing this gas into what had theretofore been manufactured gas markets, and the low cost of natural gas in comparison with manufactured gas. One million British thermal units of energy can be purchased in the form of natural gas for a fraction of its cost in the form of manufactured gas. Thus recently a hazard not theretofore serious has been introduced into the manufactured gas business in some places due to the fear in the mind of the investing public that natural gas may supplant it.

The natural gas business, however, remains in the mind of the investor as an inherently hazardous enterprise.

Another hazard in the natural gas business is the fluctuation of revenues as a result of general business condi-

tions. Investors know that a large part of the natural gas produced in the United States is used for industrial purposes. In 1938 about .79% of all gas produced in the United States was so used and about 30% of the Hope Natural Gas Company's sales in that year was used for industrial purposes.

In industry natural gas is merely a fuel and in consequence is competitive with other fuels, principally coal and oil. Not only this but where natural gas wins out in this competition the annual sales for industrial use fluctuate from year to year with the rise and fall of general business activity.

While domestic sales fluctuate widely from month to month and indeed from day to day, the average domestic

—7—

consumer tends to purchase about the same amount of gas each year, variations being caused largely by departure from average weather conditions. On an annual basis it is a fairly stable demand. Industrial sales, on the other hand, while they do not vary greatly from week to week, do increase in periods of industrial activity and decline in periods of industrial depression.

The investor, of course, is not interested in the day to day or weekly demands of either domestic consumers or industrial consumers. His interest is in the annual sales out of which he hopes the Company in which he invests will have net earnings with which to pay interest and dividends. Since the total sales of any natural gas company in a year will thus depend in part upon the degree of industrial activity, natural gas securities in the minds of the investors are associated with the risks of non-utility enterprises. If Hope were able economically to sell gas only for domestic consumption it would be regarded by the investing public as a more stable and less speculative enterprise than it now is.

This difference is well illustrated by a comparison of the revenues of the Bell Telephone system and those of the Western Union Telegraph system. The telephone revenues over a long period of years have been remarkably constant due to the fact that so large a part of this business is dependent upon residence subscribers. The revenues of the Western Union Telegraph system, on the other hand, have paralleled more nearly those of manufacturing corporations and its securities are generally regarded by investors as highly speculative.

—8—

A third factor, which would bear directly on the investor's attitude towards the Hope Natural Gas Company is the fact that natural gas production in the Appalachian field has shown no growth in the last 20 years and apparently has passed the peak. The tremendous recent growth in the production of natural gas in this country has been largely in the southwest and west. In 1906, Pennsylvania and West Virginia accounted for about 67% of the total national production, whereas in 1937, those two states accounted for only 11% of the total. California, Louisiana, Oklahoma and Texas, which together produced only a little over 1% in 1906, in 1937 accounted for about 75%. The extension of pipe lines from southern fields to densely populated areas, such as Detroit and Chicago, has been notable. That the trend in natural gas production in the Appalachian field is not upward is shown by the following table (from Moody's Manual of Public Utilities, 1939), in millions of cubic feet:

| | United States | W. Virginia | Penna. | Ohio | Kentucky |
|---|---|---|---|---|---|
| 1915 | 628,000 | 244,000 | 113,000 | 79,000 | 1,000 |
| 1920 | 798,000 | 239,000 | 125,000 | 58,000 | 3,000 |
| 1925 | 1,188,000 | 180,000 | 101,000 | 43,000 | 16,000 |
| 1930 | 1,943,000 | 144,000 | 88,000 | 63,000 | 28,000 |
| 1935 | 1,916,000 | 115,000 | 94,000 | 49,000 | 39,000 |
| 1937 | 2,447,000 | 149,000 | 115,000 | 42,000 | 55,000 |

From an investor's viewpoint the Hope Natural Gas Company does not have possibilities of growth and therefore its securities would be less attractive than, for example, the securities of El Paso Natural Gas Company which has, through expansion of its properties, shown a substantial increase in both gross and net earnings during the past several years. This is well illustrated by the following table which shows gross revenue and net earnings after depreciation per books (million $):

| | Hope (from natural gas business) | | El Paso | |
|---|---|---|---|---|
| | Gross Revenue | Net | Gross Revenue | Net |
| 1929 | 22.0 | 3.0 | | (Not available) |
| 1930 | 19.9 | 1.0 | 1.2 | 0.28 |
| 1931 | 18.0 | 0.6 | 1.5 | 0.33 |
| 1932 | 14.2 | 0.9 (decifit) | 1.3 | 0.19 |
| 1933 | 14.1 | 0.3 | 1.3 | 0.25 |
| 1934 | 16.0 | 0.9 | 2.0 | 0.33 |
| 1935 | 17.0 | 2.1 | 2.3 | 0.42 |
| 1936 | 20.1 | 3.4 | 3.2 | 1.07 |
| 1937 | 20.4 | 1.9 | 4.6 | 1.89 |
| 1938 | 16.9 | 0.5 | 4.9 | 2.08 |
| 1939 | (Not available) | | 5.8 | 2.35 |

Further details of El Paso Natural Gas Company are shown in Schedule G.

These fluctuations in revenues plus the declining trend of production in West Virginia plus the fact that for a few days in 1940 many industrial consumers dependent on the Hope Natural Gas Company for a supply were curtailed to conserve the supply for domestic users indicate to the investor declining rather than increasing sales for the Hope Natural Gas Company over any considerable future period.

As a practical matter the net earnings of the Hope Natural Gas Company from the natural gas business during recent years, as shown by its books, would prove a substantial obstacle in any refinancing of its properties. Unless earnings increased and stabilized, it would be difficult to sell common shares to the public except at a high yield. However, in approaching the problem of fixing a

fair and reasonable rate of return, I have assumed that the Commission will permit the Company a volume of net earnings from its natural gas business sufficient to support a sound capital structure equivalent to the fair valuation of its natural gas properties.

—10—

An investor would, of course, give consideration to the fact that the markets in which the Hope Natural Gas Company's product is distributed is in a thickly populated, well developed and growing industrial section of the country. This insures a continuous market for both domestic and industrial uses probably as long as adequate service can be maintained. This background of continued population and business growth in the minds of the investors would tend to give confidence in the Company's position and stability.

To some small extent an investor would take into account (and I have taken into account in the conclusions set forth) the fact that the Hope Company is a subsidiary of Standard Oil Company (New Jersey), a company which for many years has enjoyed the highest reputation from the standpoint of management, quality of production, and general efficiency of operation. In each of the plans for replacing the capital invested in these natural gas properties I have assumed that the parent company would retain a sufficient part of the equity securities to preserve working control and continue responsibility for the management of the properties.

**C. Present Security Market Conditions**

Since the matter under consideration is the fair rate of return at the present time, a brief consideration of market conditions during the past several years is appropriate. During that time we have witnessed an unprecedented low-yield money market, which has been due, in large measure, to a combination of circumstances which in-

cludes the large influx of gold, the excessive bank reserves,

—11—

the low rate of building construction and other factors. The following table shows the average yield of 40 public utility bonds (taken from Moody's Bond Survey) classified as to Moody ratings of quality.

| | 1938 | | 1939 | |
|---|---|---|---|---|
| | High | Low | High | Low |
| 40 bonds (average) | 4.23% | 3.61% | 3.76% | 3.37% |
| Aaa | 3.15 | 2.90 | 3.22 | 2.79 |
| Aa | 3.47 | 3.07 | 3.39 | 2.91 |
| A | 4.17 | 3.71 | 3.80 | 3.36 |
| Baa | 6.24 | 4.73 | 4.74 | 4.35 |

How long this low-yield market for bonds of various qualities, high and medium grade, will continue cannot be forecasted, but it is my judgment that eventually the yields on higher grade bonds will return to a normal level around 4%, and bonds rated at medium grade will find a level around 5%. This opinion is based on the reasonable expectation that natural and normal forces will eventually prevail over any artificial or temporary forces or situations.

However, the conclusions which follow are not based upon the assumption that more normal money yields will soon prevail, but take into consideration the situation as it exists, and as it has existed for the past two years.

In general, it may be said that except for a few weeks in the second half of 1939, when the approaching European crisis, the declaration of war, and the uncertainty following it, affected the markets for new securities, for the past two years the market for new security flotations of the higher grade bonds and investment quality preferred stocks was reasonably good. The market for equities (common stocks) has been a highly selective one.

—12—

According to the Commercial & Financial Chronicle (January 6, 1940) the domestic corporate issues floated were as follows:

| | Bonds & Notes | Preferred Stock | Common Stock | Total |
|---|---|---|---|---|
| 1936 | $4,026,041,600 | $270,840,364 | $282,063,717 | $4,578,945,681 |
| 1937 | 1,673,283,500 | 468,395,208 | 292,013,451 | 2,433,692,159 |
| 1938 | 2,042,783,895 | 78,560,510 | 17,837,784 | 2,139,182,189 |
| 1939 | 1,870,622,000 | 161,058,178 | 67,692,867 | 2,099,373,045 |

Security sales for new capital during 1939 were 17.4% of the total as against 40.8% in 1938 and the balance was for refunding purposes. During 1939 there were 128 issues involving $717,836,500 placed privately with institutional investors. The larger public utility issues sold during 1938 and 1939 appear on Schedule A.

## D. A Fair Rate Of Return For The Hope Natural Gas Company Is Not Less Than 8%

Considering all the factors, the principal of which have previously been stated, it is my opinion that investors would not at the present time provide the capital for the natural gas business of the Hope Natural Gas Company unless it was allowed and was earning at least 8% upon whatever is determined to be the fair value of its natural gas properties.

I have tested this opinion by considering various possible capital structures that might be set up for the Company and the earnings that would be necessary to service the securities of such capital structures with a reasonable provision for surplus. They are as follows:

### *1. Refinancing on the basis of 100% common stock issue*

The Hope Natural Gas Company is primarily a producer, purchaser from producers and exporter of natural gas. All the companies to which it sells have other sources

from which a part of their supplies are procured. Its business is therefore more speculative than that of any of the distributing companies to which it sells. Investors would

consider it to be in much the same category as a mining industrial enterprise for which the appropriate financial structure is all common stock.

The company bearing the closest similarity to the Hope Natural Gas Company is the National Fuel Gas Company which operates in the same general part of the country and has generally corresponding risks and uncertainties. (See Schedule B). National Fuel Gas Company has but one class of securities, namely no par common stock. This is also true of Interstate Natural Gas Company (Schedule C). The organizers of the Hope Natural Gas Company recognized this as the appropriate financial structure for Hope which has only common stock outstanding.

The advantages of having a capital structure of all common stock for a mining enterprise is that the Company is relieved of fixed obligations. In bad years it will have no defaults and its directors are less likely to pass or reduce dividends in such a period. Directors of such a company with no fixed obligations may safely pay up to 80% of its earnings each year in dividends, carrying the remainder to surplus.

If Hope Natural Gas Company were refinanced on the basis of 100% common stock this could not be sold to the public on the basis of a yield of less than 6½%. An underwriting syndicate to distribute this common stock to the public would be necessary. Assuming the stock to be sold

to the public at par, the underwriting syndicate would purchase such an issue at a price not greater than 96, or 4 points less than the selling price to the public.

Assuming such a refinancing the resulting capital structure, the net cost of this issue to the Company and the return which the Company would have to earn on each $100 of value for which the common shares were issued would therefore be as follows:

| | |
|---|---|
| Dividend 6.50% plus 4 points | 6.770% |
| Surplus | 1.692 |
| | 8.462% |

On this basis the Company would have to earn $8.46 per year on each $100 fair value of its property in order to maintain a 6½% dividend and make a reasonable provision for surplus. Unless earnings permitted such a provision to be made for surplus the common stock could not be sold on a 6½% basis. Paying this dividend it would be required to distribute 80% of its net earnings.

For yields expected by investors in common stocks of natural gas companies see Schedules B, C, D, E and G.

*2. Refinancing on a basis of 40% preferred and 60% common stock*

It is possible that a part of the capital requirements of the Hope Natural Gas Company could be raised by an issue of preferred stock under conditions now prevailing. If so, such a preferred stock issue could not be sold to advantage if it represented more than 40% of the total capital requirements. It might be possible at the present time to attract the public to such an issue of preferred stock, at par, yielding the investor 5½%. The balance of the capital requirements, or 60%, would be raised by the sale of common stock. In view, however, of the fact that

this common stock would be junior to 40% of preferred stock it would be necessary to sell the common stock at a yield to the investor of not less than 7%. Assuming these securities to be sold to the public at par the underwriting syndicate necessary for their distribution would purchase at prices of not more than 97 for the preferred stock and not more than 96 for the common stock.

The resulting capital structure, the net cost of these issues to the Company and the return which the Company

would have to earn on each $100 of value would therefore be as follows:

| | Per cent of capital | Net dividend cost to the Company | Per cent of earnings on each $100 fair value required to service the securities |
|---|---|---|---|
| 5½% Preferred stock | 40% | 5.670% | 2.268% |
| 7% Common Stock | 60 | 7.291 | 4.374 |
| Surplus | | | 1.458 |
| Total return required | | | 8.100% |

It will be observed that this capital structure requires the Company to earn $8.10 annually on each $100 fair value of its property. Such earnings would provide a coverage for the preferred stock dividend of about 3½ to 1, which coverage would certainly be necessary to enable the underwriters to sell a 5½% preferred stock at par. The common stock dividend would be earned 1⅓ times and this coverage is necessary to enable the 7% common stock to be sold at par. The provision for surplus is as low as can reasonably be made in view of the necessity for allowing for fluctuations in earnings due to business conditions or to rising costs, wages, materials, etc. Such provision also conforms to the sound business principle that ¾ of the net

earnings available for common stock dividends is the maximum that should be paid out on such a stock where it is junior to a preferred stock.

For yields expected by investors in preferred stocks of natural gas companies see Schedules E, F and G.

*3. Refinancing on basis of 30% bonds and 70% common stock*

Both the capital structures heretofore considered are sounder from a business point of view than one involving the issuance of bonds. With only common stock, there is no danger that failure to earn bond interest during periods of adversity will result in foreclosure or receivership and

substantial impairment or loss of the equity in the property. With a senior security consisting of preferred stock the situation is not as ideal, since accruing unpaid preferred dividends create rights which may affect the company's finances and ability to secure additional capital for many years. Nevertheless, the preferred dividends can be omitted during adverse times without endangering the enterprise as a whole. For these and other reasons, financing in part through a bond issue is not a desirable procedure, particularly for a company such as the one under consideration.

Nevertheless it is probable that at the present time some part of the capital requirements of this Company could be raised through the sale of bonds. As a final test I have therefore assumed a capital structure which includes bonds. If these bonds are to be sold to yield a low return to the investor they must, of course, be well secured and the interest on them must be earned many times over. In my

opinion on property of this nature 30% of bonds is as large a part of the capital as can be raised by their sale, the balance, or 70%, to be raised from the sale of common stock.

In my opinion an issue of 15-year first mortgage bonds of the Hope Natural Gas Company, secured by all its natural gas property, would rate not higher than Baa, Moody's Rating. At best it would be a medium grade bond. In view of all the factors previously outlined these bonds would bear a coupon rate of not less than 4%. The remainder of the capital would be raised through the sale of 7% common stock. Assuming the price of these securities to the public to be par, the underwriting syndicate would purchase the bonds at a price of not more than 98, which would give it a 2 point spread or $20 per $1,000 on the bonds, and the common stock at a price of not more than 96, which allows a 4 point spread.

The resulting capital structure, the net cost of these issues to the Company and the return which the Company would have to earn on each $100 of value of its property would therefore be as follows:

| | Per cent of Capital | Net interest and dividend cost to the Company | Per cent of earnings on each $100 fair value required to service the securities |
|---|---|---|---|
| 4% Mortgage bonds | 30% | 4.181% | 1.254% |
| 7% Common stock | 70 | 7.291 | 5.103 |
| Surplus | | | 1.701 |
| Total return required | | | 8.058% |

Even by running the risks of fixed charges and procuring the lower cost money represented by 4% bonds it will be seen that in order to refinance its property the Company would need to earn a little more than $8 on each $100 of fair value. The interest on the bonds would be earned more than 6 times which is necessary to make them marketable at the prices fixed. The dividends on the common stock would be earned 1⅓ times which is necessary to its sale. Here again the Company would be paying out either in interest or dividends almost 80% of its net earnings, which is slightly more than a company with outstanding bonds should distribute.

For return expected by investors in the bonds of natural gas companies see Schedules E, F, G, H, I and J.

**E. Summary**

Having tested the rate of return by three possible capital structures we find that these vary from 8.46% return to 8.06% return. All of them indicate a return of above 8% as necessary to this enterprise. It is my opinion that securities to refinance these natural gas properties could not be sold if the return were less than 8% and that the fair rate of return for the natural gas properties of the Hope Natural Gas Company at the present time is not less than 8%.

Schedule B

## NATIONAL FUEL GAS COMPANY

A holding company controlling natural gas producing, transmission and distribution properties in a well-developed area in Pennsylvania, New York, eastern Ohio and Ontario, including Buffalo and Jamestown, N. Y. Industrial sales are less than 15% of total, and about 40% of combined manufactured and natural gas requirements is purchased. Rockefeller Foundation owns 22% of common and other large holdings are identified with Rockefeller interests.

Capital Stock: 3,810,183 shares (no par).

**Income statistics (Million $)**

| | Gross Revenue | Net Revenue | Earnings Per Share |
|---|---|---|---|
| 1934 | 15.80 | 4.78 | 1.26 |
| 1935 | 15.75 | 3.81 | 1.00 |
| 1936 | 14.71 | 4.54 | 1.19 |
| 1937 | 13.86 | 3.66 | 0.96 |
| 1938 | 13.19 | 3.21 | 0.83 |
| 1939 | 13.65 | 3.63 | 0.95 |

Has been paying $1 dividends on common which rate while not fully earned in 1937, 1938 and 1939, the management has indicated a willingness to continue for a considerable period of time. The Company has a very strong cash position with net working capital on Dec. 31, 1939 of $11,229,000 including cash items of $10,280,000. The average price for the stock during the past two years has been 12 to 13 at which figure the yield is approximately 8%.

On February 15, 1940 an investment banking firm announced the sale of a block of 15,670 common shares at $12.50 per share to yield 8%.

—22—

Schedule C

## INTERSTATE NATURAL GAS CO., INC.

Produces and sells at wholesale. Owns 54,000 acres in the Monroe (Louisiana) field and 170 miles of 22-inch main pipe line together with compressor stations and field lines. The pipe line extends to Baton Rouge. Standard Oil owns 53.97% of the stock. Other stock interests include Rockefeller Foundation and Columbian Carbon Co.

Capital Stock: 952,953 shares (no par).

**Income Statistics (Million $)**

| | Gross Revenue | Net | Earnings Per Share | Dividend Per Share |

—29—

In September, 1936, a syndicate of investment bankers purchased from private investors and sold to the public 60,000 shares of common stock at $20 per share. The underwriters were allowed $1 per share or 5%. The capital structure at that time consisted of $11,038,000 bonds, $1,479,700 7% cumulative preferred stock and 408,558 shares of common stock, which at $20 per share made an aggregate of

$6,171,180 common stock. The first mortgage 4½% bonds due 1951 were quoted at 101½ (yielding about 4.36%). The 7% preferred stock was then quoted at 106 (yielding about 6.60%). The company was showing a sharply rising trend in gross operating revenue and net income. In January, 1939, the bonds were retired and a new issue of $6,000,000 first mortgage 15-year 3½'s due December 1, 1953 were sold privately to six institutional investors at 98½ to yield about 3.63%. The preferred stock is unlisted but during 1939 broker's bids ranged from 105½ to 111¼. At the year end 109½ was bid at which figure the yield was 6.39%.

—30—

Schedule H

## NORTHERN NATURAL GAS CO.

Purchases, produces, transmits and distributes natural gas principally at wholesale in Iowa, Kansas, Nebraska, South Dakota and Minnesota. Cities supplied at wholesale include Omaha and Lincoln, Nebraska, Council Bluffs, Des Moines and Sioux City, Iowa, and Minneapolis and Rochester, Minnesota. Supply comes from Texas Panhandle and Kansas. Purchases most of its requirements. Stock is all owned by Lone Star Gas Corp., North American Light & Power Co. and United Light & Railways Co.

In August, 1939 an issue of $16,000,000 1st mortgage and 1st lien 3¼'s-1954 was sold privately at par.

| | Gross | Net for Interest |
|---|---|---|
| 1935 | $7,952,000 | $2,810,000 |
| 1936 | 9,037,000 | 3,019,000 |
| 1937 | 9,775,000 | 3,660,000 |
| 1938 | 9,959,000 | 3,521,000 |

Interest charges on the new bonds, $520,000.

—31—

Schedule I

## SOUTHERN NATURAL GAS CO.

Purchases gas from producers mostly in Louisiana. Reorganized in October 1935 under terms of Section 77B of Bankruptcy Act.

### Debt and Capital Issues

| | |
|---|---|
| Funded debt | $19,326,523 |
| Bank loans | 1,475,000 |
| Common (Par 7½) | 691,970 shares |

### Income Statistics (Million $)

| | Gross Revenue | Net for Interest | Net for Dividends |
|---|---|---|---|
| 1937 | 7.0 | 2.6 | 1.39 |
| 1938 | 6.8 | 2.2 | 1.03 |

The $12,939,000 first 4½'s-1951 were sold at par in November, 1936.

### Bond Price Range

| 1939 | 1938 | 1937 |
|---|---|---|
| 106⅜—100¾ | 102—91 | 101½—94½ |

About 48% of the common is owned by Federal Water Service Corp. No dividend until June 30, 1939.

—32—

Schedule J

## NORTH PENN GAS CO.

Distributes gas in Pennsylvania and New York and through subsidiaries produces gas.

### Debt and Capital Issues

| | |
|---|---|
| Funded Debt | $3,450,000 |
| $7 Prior Preferred | 631,200 |
| $7 Preferred | 1,316,000 |
| Common | 100,000 shares |

### Income Statistics (Million $)

| | Gross Revenue | Net for Interest |
|---|---|---|
| 1935 | 2.3 | 0.55 |
| 1936 | 2.5 | 0.57 |
| 1937 | 2.6 | 0.54 |
| 1938 | 2.5 | 0.44 |

Common and preferred all owned by Penna. Gas & Electric.

The 5½% bonds due 1957 are callable at 105 to May 1, 1937 and ¼% less each November 1 thereafter.

### Bond Price Range

| 1939 | 1938 | 1937 | 1936 | 1935 |
|---|---|---|---|---|
| 107¼—102½ | 106—102 | 106½—102½ | 106½—101 | 105½—100 |

## STATEMENT OF EXPERIENCE AND QUALIFICATIONS OF PAUL B. COFFMAN

**1. Name, address and age**

Paul B. Coffman, 345 Hudson Street, New York City; age 39.

**2. Education**

Graduate of Ohio State University in 1923, with degree of B. S. Graduate of Harvard University, Graduate School of Business Administration, 1926, with degree of M.B.A.

**3. Present position**

Vice-President of Standard Statistics Company, Inc., a corporation engaged, among other things, in gathering, collating, analyzing and disseminating, on both a printed and personal advisory basis, statistical and general information on all phases of business, industry and investments.

**4. Experience and qualifications**

1926-1927: Professor of Economics at the College of William and Mary, Williamsburg, Virginia.

1927-1936: Professor of Accounting and Business Policy at the Graduate School of Business Administration at Harvard University; consulting economist for a number of industrial corporations and financial advisory institutions; during 1931 and 1932 Executive Vice-President and General Manager of Poor's Publishing Company of New York City, a firm which is engaged in a business similar to that of Standard Statistics Company, Inc. and publishes Poor's Manuals.

—3—

1935-1939: Departmental Manager of Standard Statistics Company, Inc., having charge of statistical and research investigation and valuations.

1939 to date: Vice-President of Standard Statistics Company, Inc., directly in charge of statistical and economic research and valuation for individuals, institutional and corporate clients.

Duties with Standard Statistics Company, Inc., have included the constant examination and analyses of many situations involving all kinds of securities and various corporations with a view to determining the hazards involved and the intrinsic worth of the securities based upon personal investigation and analysis, and the presentation of the findings to the many clients of Standard Statistics Company, Inc.

—5—

## WRITTEN STATEMENT OF PAUL B. COFFMAN

### 1. Purpose Of This Exhibit

In March of this year, Standard Statistics Company, Inc. was retained by the Hope Natural Gas Company to make a statistical study for the years 1937, 1938 and 1939 of the investors' appraisal of the risks of capital invested in the natural gas business as compared with the risks of capital invested in other utility industries. The analysis covered the following utility classifications, namely, (1) electric utility operating companies, (2) water companies, (3) manufactured and mixed gas companies and (4) natural gas companies.

This exhibit is a statement of the result of that investigation. The working papers on which it is based are available for inspection by all parties to the present proceedings.

—6—

### 2. Method Of Procedure

A group of companies in each of the utility classifications was selected on bases which will be described below. Statement E at pages 26 to 33 of this exhibit contains a general description of the business of each of the companies and the territory in which it operates.

The general method of procedure as to each company and group of companies involved four steps, as follows:

(1) The indicated total market value of all of the securities of a single company was determined by taking the sum of the amounts produced by multiplying the number of each class of security (bonds, preferred and common stocks as the case may be) outstanding at the end of each year by the average of its high and low market quotations in that year.

*Example:*

**Indicated Market Value of the Securities Outstanding of the Boston Edison Company for 1939**

| | Capital Outstanding Dec. 31, 1939 | 1939 Market Prices | | | Indicated Market Value |
|---|---|---|---|---|---|
| | | High | Low | Average | |
| Capital Stock ($100 par) | 617,164 shs. | 160 | 127 | 143.50 | $ 88,563,034 |
| 1st Mortgage Bonds Series A, 3½'s, '65 | $53,000,000 | 112½ | 103½ | 108 | 57,240,000 |
| | | | | Total | $145,803,034 |

(2) Next there was determined for the individual company the total earnings available for distribution to these securities after taxes, depreciation and

all other miscellaneous charges as reported in the particular company's published annual report to stockholders.

*Example:*

The consolidated earnings of the Boston Edison Company for 1939 available for its capital after taxes, depreciation and all other miscellaneous charges, as shown in the published report to its stockholders for 1939, was $7,297,587.

(3) The earnings so determined under (2) were then divided by the indicated market value of all securities as determined under (1) and a rate for the year was thus obtained.

*Example;*

In the case of the Boston Edison Company for 1939, dividing the consolidated earnings available for capital, in the amount of $7,297,587, as shown above, by the indicated market value of all capital of $145,803,034, gives a percentage of 5.01 per cent, which, in my opinion, fairly indicates the investors' appraisal of the risks of capital employed in that enterprise for the year 1939.

(4) Having determined in the manner described above the investors' appraisal of the risks of capital employed in each company selected, the indicated market value of all the companies in each group, determined under (1) above, was added to obtain the indicated market value of the capital securities of the entire group. Similarly, the earnings available for distribution to the securities of each of the companies, as determined under (2) above, were added to obtain the total earnings available for distribution to securities of the entire group. The

latter figure was then divided by the former in order to obtain the investors' overall appraisal of the risk of all capital in the group. This was done for each of the years 1937, 1938 and 1939.

*Example:*

**Determination of Investors' Appraisal of Risks of Capital for Electric Operating Utility Companies as a Group**

| | Indicated Market Value of Capital | | |
|---|---|---|---|
| | 1937 | 1938 | 1939 |
| Boston Edison Company | $ 140,377,138 | $ 132,313,981 | $ 145,803,034 |
| Commonwealth Edison Company | 627,713,979 | 659,945,351 | 705,040,810 |
| Consolidated Edison Co. of New York, Inc. | 1,081,937,457 | 1,021,974,547 | 1,101,280,966 |
| Consolidated Gas, Electric Light & Power Co. of Baltimore | 185,161,844 | 173,973,927 | 192,758,869 |
| Detroit Edison Company | 296,761,357 | 276,549,713 | 303,425,025 |
| Pacific Gas & Electric Company | 638,039,237 | 634,253,084 | 673,724,413 |
| Southern California Edison Company, Ltd. | 343,044,455 | 325,193,494 | 332,597,011 |
| Total | $3,313,035,467 | $3,224,204,097 | $3,454,630,128 |

| | Earnings Available for Distribution to Capital | | |
|---|---|---|---|
| | 1937 | 1938 | 1939 |
| Boston Edison Company | $ 7,505,886 | $ 7,163,506 | $ 7,297,587 |
| Commonwealth Edison Company | 39,294,881 | 39,006,579 | 41,254,094 |
| Consolidated Edison Co. of New York, Inc. | 52,797,146 | 53,893,205 | 55,643,286 |
| Consolidated Gas, Electric Light & Power Co. of Baltimore | 9,162,762 | 8,316,215 | 9,240,571 |
| Detroit Edison Company | 15,898,965 | 13,841,099 | 15,685,727 |
| Pacific Gas & Electric Company | 37,322,975 | 35,976,977 | 38,214,304 |
| Southern California Edison Company, Ltd. | 19,146,425 | 19,019,797 | 19,480,429 |
| Total | $ 181,129,040 | $ 177,217,378 | $ 186,815,998 |
| Investors' Appraisal of Risks of Capital | 5.47%* | 5.50%* | 5.41%* |

Note: (*) Obtained by dividing "Earnings Available for Distribution to Capital" by "Indicated Market Value of Capital."

## 3. Analysis of Data On Electric Utility Operating Companies

All utility operating companies upon which Standard Statistics Company, Inc. currently publishes data in Standard Earnings Bulletin were first listed. These were the

more important utility operating companies in which there was substantial investment interest. From this list there were excluded all companies whose operations were not predominantly in the electric field. The resulting list included the following companies:

Boston Edison Company
Commonwealth Edison Company
Consolidated Edison Co. of New York, Inc.
Consolidated Gas, Electric Light & Power Co. of Baltimore
Detroit Edison Company
Pacific Gas & Electric Company
Southern California Edison Company, Ltd.

For each of these companies and for the group of companies, for each of the years 1937, 1938 and 1939, the investors' appraisal of the risks of capital as a percentage was obtained by application of the method fully described in Section 2 above.

The actual results of these determinations to the group of electric utility operating companies are presented in the following table:

**Determination of the Investors' Appraisal of the Risks of Capital for Electric Utility Operating Companies**

| | 1937 | 1938 | 1939 |
|---|---|---|---|
| Total Indicated Market Value of Capital | $3,313,035,467 | $3,224,204,097 | $3,454,630,128 |
| Total Earnings Available for Indicated Capital | 181,129,040 | 177,217,378 | 186,815,998 |
| Investors' Appraisal of Risks of Capital | 5.47% | 5.50% | 5.41% |

In other words, this analysis indicated that investors appraised the risk of capital invested in electric operating utility companies as a group in 1937, 1938 and 1939, respectively, at 5.47 per cent, 5.50 per cent and 5.41 per cent, or an average for the three years of 5.46 per cent.

Supporting data on each of the companies mentioned and for each of the years studied, as well as total figures

for the group, are presented in Statement A at page 21 of this exhibit.

—11—

**4. Analysis of Data on Water Companies**

A list of all operating companies engaged solely in the water business was first prepared from Standard Corporation Records. From this list companies were eliminated for the following reasons:

1. Companies whose common stocks were held by one of the larger holding companies, such as American Water Works & Electric Company, Inc., the Federal Water Service Corporation and the Community Water Service Company, and whose stocks had no obtainable market evaluation.
2. Companies whose stocks were closely held by relatively few individuals and had no available market evaluation.
3. Companies whose 1939 gross operating revenues were less than $500,000. This latter class was not deemed of sufficient importance to be included in the study.

The result of these eliminations in the over-all list was the following group of companies:

Bridgeport Hydraulic Company
Elizabethtown Water Co. Consolidated
Hackensack Water Company
Middlesex Water Company
New Haven Water Company
Plainfield-Union Water Company
Stamford Water Company

The method of determining the investors' appraisal of the risks of capital in this division of the utility industry was the same as that previously described in Section 2 above.

The actual results of these determinations for the group of water companies are presented in the following table:

**Determination of Investors' Appraisal of Risks of Capital for Water Company Securities**

| | 1937 | 1938 | 1939 |
|---|---|---|---|
| Total Indicated Market Value of Capital | $79,947,987 | $76,395,996 | $79,414,304 |
| Total Earnings Available for Indicated Capital | 4,410,457 | 4,114,122 | 4,495,678 |
| Investors' Appraisal of Risks of Capital | 5.52% | 5.39% | 5.66% |

—12—

In other words, this analysis indicated that investors appraised the risk of capital invested in water companies as a group in 1937, 1938 and 1939, respectively, at 5.52 per cent, 5.39 per cent and 5.66 per cent, or an average for the three years of 5.52 per cent.

Supporting data on each of the companies mentioned and for each of the years studied, as well as total figures for the group are presented in Statement B at page 22.

—13—

**5. Analysis of Data on Manufactured and Mixed Gas Companies**

A list was prepared of all operating companies distributing manufactured or mixed gas and listed in Standard Corporation Records. From this list companies were elimininated for the following reasons:

1. Companies which did not have stocks outstanding in the hands of the public and for which there was no market evaluation.
2. Companies whose gross revenue was predominantly obtained from services other than the distribution of manufactured and/or mixed gas.
3. Companies which were in receivership at the end of 1939. Figures of such companies would not be comparable or representative.
4. Companies with gross revenues in 1939 of less than $1,000,000, because these were too small to have any important bearing on the final results.

After giving effect to these eliminations, the following companies remained in the list:

Bridgeport Gas Light Company
Brooklyn Union Gas Company
Elizabethtown Consolidated Gas Company
Hartford Gas Company
Laclede Gas Light Company
Peoples Gas Light & Coke Company
Providence Gas Company
Seattle Gas Company
Springfield (Mass.) Gas Light Company
Washington Gas Light Company

The method of determining the investors' appraisal of the risks of capital in this division of the utility industry was that previously described in Section 2 above.

The actual results of these determinations for the group of manufactured and mixed gas companies are presented in the following table:

—14—

**Determination of the Investors' Appraisal of the Risks of Capital for Manufactured and Mixed Gas Companies**

| | 1937 | 1938 | 1939 |
|---|---|---|---|
| Total Indicated Market Value of Capital | $279,745,945 | $245,431,786 | $262,282,318 |
| Total Earnings Available for Indicated Capital | 17,266,576 | 16,235,071 | 17,342,623 |
| Investors' Appraisal of Risks of Capital | 6.17% | 6.61% | 6.61% |

In other words, this analysis indicated that investors appraised the risk of capital invested in manufactured and mixed gas companies in 1937, 1938 and 1939, respectively, at 6.17 per cent, 6.61 per cent and 6.61 per cent, or an average for the three years of 6.46 per cent.

Supporting data on each of the companies mentioned and for each of the years studied, as well as total figures for the group, are presented in Statement C at page 23.

## 6. Analysis of Data on Natural Gas Companies

A list was prepared of all operating and holding companies engaged in any phase of the natural gas business. From this there were eliminated:

1. Companies which had no stocks outstanding in hands of the public and no obtainable market evaluation of their stocks.
2. Companies which were not exclusively engaged in the natural gas business.
3. Companies in receivership at the end of 1939.

After giving effect to these eliminations, the following companies remained:

Duquesne Natural Gas Company
El Paso Natural Gas Company
Houston Natural Gas Corporation
Interstate Natural Gas Company, Inc.
Lone Star Gas Corporation
Memphis Natural Gas Company
Mountain Fuel Supply Company
National Fuel Gas Company
Northern Oklahoma Gas Company
Northern Utilities Company
Oklahoma Natural Gas Company
Pacific Lighting Corporation
Southern Natural Gas Company

The procedure followed in determining the investors' appraisal of the risks of capital in this division of the utility industry was that previously described in Section 2 above.

The actual results of these determinations for the group of natural gas companies are presented in the following table:

**Determination of the Investors' Appraisal of the Risks of Capital for Natural Gas Companies**

| | 1937 | 1938 | 1939 |
|---|---|---|---|
| Total Indicated Market Value of Capital | $461,156,640 | $420,658,527 | $446,994,750 |
| Total Earnings Available for Indicated Capital | 36,488,033 | 32,757,549 | 33,658,297 |
| Investors' Appraisal of Risks of Capital | 7.91% | 7.79% | 7.53% |

—16—

In other words, this analysis indicated that investors appraised the risk of capital invested in natural gas companies in 1937, 1938 and 1939, respectively, at 7.91 per cent, 7.79 per cent and 7.53 per cent, or an average for the three years of 7.74 per cent.

Included in the above group of natural gas companies is Pacific Lighting Corporation. This company, through subsidiaries, distributes natural gas to 272 cities and towns in Southern California, including Los Angeles. Its subsidiaries serve about half the population of the state. Market prices of the securities of these operating companies are not available. In the absence of these, this holding company was treated as a single operating company in the above group. As a result, its indicated market value is nearly 40 per cent of that of the entire group of natural gas companies.

This gives entirely too much weight in the above table to a purely distributing company. Pacific Lighting Corporation owns no gas producing facilities. It does not run any of the risks of a producing and transporting company as does the Hope Natural Gas Company. It purchases its gas from independent oil and gas producers operating in the immediate territory served by it, where the actual and potential reserves are the greatest in its history.

For these reasons, the risks of capital employed in this company more nearly approximate those of strictly distributing companies serving manufactured or mixed gas. Comparison of the investors' evaluation of the risks of this

company as compared with the risks in the manufactured and mixed gas companies set forth above is as follows:

—17—

**Comparison of Investors' Appraisal of Risks of Capital in Pacific Lighting Corporation as Compared with the Manufactured and Mixed Gas Companies Group**

| | 1937 | 1938 | 1939 | Three Year Average |
|---|---|---|---|---|
| Pacific Lighting Corporation | 7.20% | 7.35% | 6.26% | 6.94% |
| Manufactured and Mixed Gas Companies Group | 6.17% | 6.61% | 6.61% | 6.46% |

As a test, in the following table all figures for the Pacific Lighting Corporation are eliminated, and with this elimination the figures for the 12 natural gas companies remaining in the group are as follows:

**Determination of the Investors' Appraisal of the Risks of Capital for Natural Gas Companies (Excluding Pacific Lighting Corporation)**

| | 1937 | 1938 | 1939 |
|---|---|---|---|
| Total Indicated Market Value of Capital | $294,414,969 | $263,667,801 | $275,217,638 |
| Total Earnings Available for Indicated Capital | 24,488,305 | 21,213,539 | 22,902,944 |
| Investors' Appraisal of Risks of Capital | 8.32% | 8.05% | 8.32% |

In other words, when figures for the Pacific Lighting Corporation are eliminated from the group of natural gas companies, investors appraised the risk of capital invested in the remaining natural gas companies in 1937, 1938 and 1939, respectively, at 8.32 per cent, 8.05 per cent, and 8.32 per cent, or an average for the three years of 8.23 per cent.

Any inference from the summary figures given above for all natural gas companies that the investors' appraisal of the risk is decreasing is caused solely by the Pacific Lighting Corporation figures, which dropped from 7.20 per cent and 7.35 per cent in the years 1937 and 1938, respec-

—18—

tively, to 6.26 per cent in 1939. The above figures for the rest of the natural gas industry show no decline in the in-

vestors' appraisal of the risk which remained constantly above 8 per cent.

For the reasons set forth, it is concluded that the last table of figures presented above more nearly approximates the investors' appraisal of the risks of capital in the natural gas industry as a whole than does the preceding table which includes Pacific Lighting Corporation.

Supporting data on each of the natural gas companies mentioned and for each of the years studied, as well as total figures for the group, are presented in Statement D at page 24.

Although plausible reasons might be given for the elimination of several of the smaller companies included in the final table of natural gas companies, if this were done no substantial change in the results would be made. This is clearly indicated by Statement D-1 at page 25.

## 7. Summary of Analyses

The foregoing analyses indicate most clearly that the percentages representing the investors' appraisal of the risks of capital invested in the various divisions of the utility industry analyzed, increased as the risks of the particular utility division increased. In order that this may be seen clearly, the summary figures are presented as follows:

—19—

**Investors' Appraisal of Capital Risk in Various Divisions of the Utility Business**

| | 1937 | 1938 | 1939 | Three Year Average |
|---|---|---|---|---|
| Electric Utility Operating Companies | 5.47% | 5.50% | 5.41% | 5.46% |
| Water Companies | 5.52 | 5.39 | 5.66 | 5.52 |
| Manufactured and Mixed Gas Companies | 6.17 | 6.61 | 6.61 | 6.46 |
| All Natural Gas Companies | 7.91 | 7.79 | 7.58 | 7.74 |
| All Natural Gas Companies Excluding Pacific Lighting Corporation | 8.32 | 8.05 | 8.32 | 8.23 |

The above table clearly shows that in 1937, 1938 and 1939, investors appraised the risk of manufactured and mixed gas companies as a group at approximately 1 per cent higher, and the risk of natural gas companies as a group at 2 per cent to 2½ per cent higher, than the risk of electric operating companies and water companies.

SIGNED at New York, New York, this May 22, 1940.

PAUL B. COFFMAN.

## 18. COMPANY WITNESS COFFMAN'S EXHIBIT NO. 27-A ENTITLED: "Investors' Appraisal of Comparative Risks of Capital in the Natural Gas Business, 1940 (Supplement to Exhibit No. 27)"

# WRITTEN STATEMENT OF PAUL B. COFFMAN

## 1. Purpose of this Exhibit

The purpose of this exhibit is to bring up-to-date, through the inclusion of data for 1940, a previous exhibit dated May 22, 1940, entitled "Investors' Appraisal of Comparative Risks of Capital in the Natural Gas Business, 1937-1939" which was prepared for the Hope Natural Gas Company.

## 2. Summary of Analyses

A summary of the findings covering the year 1940 and the average for the four years 1937-1940, both inclusive, as compared with data presented previously covering each of the years 1937, 1938 and 1939, and the three year average 1937-1939, both inclusive, is presented in the following table. The method of computing the data for 1940 was exactly the same as for previous years.

**Investors' Appraisal of Capital Risk in Various Divisions of the Utility Business**

| | 1937 | 1938 | 1939 | Three Year Average 1937-1939 | 1940 | Four Year Average 1937-1940 |
|---|---|---|---|---|---|---|
| ric Utility Operating npanies | 5.47% | 5.50% | 5.41% | 5.46% | 5.43% | 5.45% |
| r Companies | 5.52 | 5.39 | 5.66 | 5.52 | 5.23 | 5.45 |
| ufactured and Mixed Gas npanies | 6.17 | 6.61 | 6.61 | 6.46 | 6.88 | 6.57 |
| atural Gas Companies | 7.91 | 7.79 | 7.53 | 7.74 | 7.97 | 7.80 |
| atural Gas Companies luding Pacific Lighting poration | 8.32 | 8.05 | 8.32 | 8.23 | 9.34 | 8.51 |

—2—

The above table shows conclusively that, for 1940, investors continued to appraise the risk of natural gas companies as a group at a rate considerably higher than for the other divisions of the utility industry studied, namely, manufactured and mixed gas companies, water companies and electric utility operating companies.

On the basis of averages for the four years 1937-1940, both inclusive, the risk of natural gas companies, as demonstrated by the investors' appraisal of all outstanding capital obligations, averaged approximately 2 per cent higher than for manufactured and mixed gas companies, and approximately 3 per cent higher than for electric operating companies and water companies.

SIGNED at New York, New York this July 3, 1941.

PAUL B. COFFMAN.

## 19. TESTIMONY OF COMPANY WITNESS PERCY W. BROWN AS TO PRESENT AND HISTORICAL RATE OF RETURN, WEDNESDAY, JULY 9, 1941, RECORD PAGES 5200 TO 5229

—5200—

Mr. Cockley: Mr. Brown, will you take the stand?

Whereupon, PERCY W. BROWN, called as a witness on behalf of the Hope Natural Gas Company, having been previously sworn, was examined and testified as follows:

Trial Examiner: The stipulation with respect to the correction of the record for the last preceding series of sessions is approved by the Trial Examiner, and will be incorporated into the record of these proceedings.

(The stipulation of corrections will be found at the end of today's transcript.)

Trial Examiner: You may proceed with the examination of the witness.

DIRECT EXAMINATION by Mr. Cockley.

Q. Mr. Brown, you testified previously in this case as to the present day rate of return for the Hope Company, did you not? A. Yes, in June, 1940, in Clarksburg, West Virginia.

Q. And am I correct that your testimony at that time was directed to your opinion as to the fair rate of return to be applied to the present fair value of the property of the Hope Company? A. You are correct.

—5201—

Q. Now since you testified before, the Commission has introduced, through Mr. Knapp, a 3-volume exhibit which is marked Exhibit 82, 82-A and 82-B in this case. I should like to inquire whether, in view of the voluminous information contained in those volumes, you want in any re-

spect to modify or change the testimony that you gave in June of 1940? A. No, I do not. The statistical information in Mr. Knapp's exhibits with reference to bond prices, preferred stock prices and common stock prices, and ratios, is extremely interesting and bears out the figures which I have. As a matter of fact, all that information was available to me and was given due consideration. I think the exhibit is an extremely capable and far-reaching one, but at the same time I wouldn't want to be understood as agreeing to all the information in it as being necessary. Some of it is a little superfluous, such as Federal re-discount rates, prime commercial paper rates, and so forth.

Q. Now aside from this exhibit, Mr. Brown, have any other matters come to your attention between the time you testified before, that would either confirm or cause you to modify the opinion you expressed at that time as to the fair rate of return to the Hope Company for the present and the near future time? A. Yes, there has been one very significant event that has taken place this summer, the almost complete refinancing of a major natural gas enterprise, the Southern Natural Gas Company.

—5202—

Q. Will you tell us about that? A. The two prospectuses are dated June 6, 1941, one covering $13,000,000 first 3½ percent bonds due 1956, which were sold to the public at 103, and netted the company 101¼. $4,500,000—2½ percent serial notes, sold presumably to the banks at par, and 234,868 shares of common stock offered to stockholders at $12.50 a share, with no underwriting other than the commitment of the parent company, the Federal Water Service Corporation, which agreed to purchase any stock not subscribed for by the stockholders, thus netting the company $12.50 per share.

The stockholders of record June 13, 1941, were given the right to subscribe for new shares in the ratio of one-fifth of one share for each share held, and the warrants

will expire September 15, 1941. The notes were sold to four banks, presumably at par.

Thus, all classes of securities are being issued to the public at the present time, that is, June, 1941, and up to September 15, 1941.

The depreciated book value of the properties was estimated as of December 31, 1940, at $30,979,000, which makes the mortgage in effect about 41.9 per cent. The bonds carry a Moody rating of A, and the interest on these bonds is being earned over 7 times.

—5203—

Thus, $13,000,000 of bonds at 101¼ makes $13,162,500; $4,500,000 of notes at par makes $4,500,000; 1,409,212 shares of common stock, the full amount outstanding, at $12.50 per share, makes $17,615,150; or a grand total of $35,277,650.

The net income or the past 4¼ years, after taxes and depreciation, is as follows:

1937—$2,478,652.
1938—$2,329,074.
1939—$2,799,244.
1940—$3,071,786.

And for the 12 months ending March 31, 1941—$3,087,638.

Most of the money was used for refunding purposes, but there are some $7,000,000 of new money, namely, $4,800,000 from the sale of this block of stock going on at the present time, plus a block of stock which was put out last January and February in 1941, of 482,374 shares, and I have given no weight to the earning power of this new money, of approximately $7,000,000.

But taking the picture as it stands today, $35,277,000 cost of the money and $3,087,000 of earnings, gives an earnings price ratio of 8.75 percent.

I might say that the prices at which these securities were sold were approved by the Securities and Exchange Commission.

And I think that is a very significant piece of financial

—5204—

history, as it is the most complete refinancing of a natural gas property in my recollection.

Q. Well, would that cause you in any respect to change the opinion you expressed before as to the fair rate of return for the Hope Company? A. No, it would not.

Q. Mr. Brown, since you testified in the former case, I have asked you to make such investigation as was necessary in order to form an opinion as to the rate of return which the Hope Company could reasonably expect to receive in the past at the various times at which it constructed or purchased property in its present plant. And I would like to inquire whether you have made such an investigation, and whether you are prepared to testify on that subject? A. I have and I am.

Q. Now will you state whether you have determined what you consider an appropriate rate of return for money invested by Hope in its plant for each year since the beginning, or have made some division of the entire period? A. Well, my investigation led me to make four divisions. It seems that the history of the Hope Company falls into four natural divisions—

Mr. Springer: (Interposing) I object to this line of inquiry. I don't see the relevancy of it. I would like to have a statement of the purpose of this type of testimony,

—5205—

the rate of return being a current problem.

Mr. Cockley: I would be very glad at this point, Mr. Examiner, because there are no secrets about this and no mystery, and I would be very glad to advise both the Examiner and counsel the purpose of it.

We put in evidence of reproduction cost new of this property, and depreciated, as bearing upon the present fair value of the property. As we all know, there have been a lot of changes upward in price levels since this property began to be constructed in 1898, and that is one way of reflecting the increased value of property that has occurred by reason of those changes in price levels when that property was constructed particularly prior to World War No. 1, as much of the Hope property was.

And we also, through Mr. Brown, introduced testimony as to what the present fair rate of return on that property was.

Now the Power Commission's staff has come in with what they say is an original cost, a depreciated original cost. I shall not argue at the present time that what they claim to be original cost isn't any such thing, but it is what they claim to be original cost; that is, they want to put in the rate base the pipe lines that were constructed prior to World War No. 1, at the low costs that were prevailing at that time.

Now I propose to have Mr. Brown testify as to what the rate of return that a company such as the Hope Com-

—5206—

pany fairly was entitled to receive under all conditions prevailing at that time, and had a right to expect to receive on that property at the time it was constructed.

In other words, if we are going to go back to the original cost of this property, and the dollars that the Hope Company put in plant back in pre-World War periods, if that is to be given any consideration there must also be given consideration to the rate of return that the builders of that property had a right to expect when they put those dollars in property and thus permanently devoted them to public service.

To be more specific, if the rate of return in the development stage of this property, in its early history, under

all the conditions that prevailed at that time, the owners of property of this kind, engaged in that kind of a new enterprise, were entitled to a return of 20 percent upon it, at that time; and you are now going to take, you are now not going to reflect any increased value which we know has occurred in that property, then the proper rate of return to a company, that is the rate of return that they reasonably had a right to expect at the time they invested their dollars.

In other words, it is the rate of return that must accompany any notions as to original cost, as a rate base, and I am putting it in and I am offering Mr. Brown's testimony upon that point for that purpose, and I submit that it is entirely relevant and entirely proper testimony, and

—5207—

it is testimony that necessarily must accompany this notion that they have that the original cost can be used as a rate base.

Trial Examiner: Have you qualified this witness to testify with respect to that?

Mr. Cockley: Well, I think so. This witness, as I recall his qualifications, has testified that he has been in this business since 1908 or 1909. He has devoted his whole life to it.

Trial Examiner: That being the case, he is qualified to testify as to what rate of return this company was entitled to receive.

Mr. Cockley: He is qualified to express an opinion as to the rate of return that investors in a natural gas property such as this was, under all the conditions prevailing at various times over the past, the rate of return that they fairly were entitled to receive on money invested in plant account at those various times.

Mr. Springer: Do you mean that he has made a study for each of the 40 years in the past, of the prevailing current rate of return for each of those years?

Mr. Cockley: Well, he has grouped it by periods, as he has just stated.

Mr. Springer: And in 1909 he was a bookkeeper in the Boston office of Hornblower & Weeks?

Mr. Cockley: Well, if there is any question about

—5208—

qualification, I shall ask him additional questions.

Mr. Slaff: The objection goes much deeper than that, Mr. Examiner, before we get to the problem of qualification of this witness. I think the objection goes to the heart of this testimony, its relevancy and its materiality in this case. The relevancy of any testimony as to what an investor expected by way of return in 1898 or 1900 or 1915, or any other date, the relevancy of such testimony on the problem of fixing rate of return in the year 1941 for that time, and the reasonably immediate future, and it is to that that the objection is in the first instance directed.

Mr. Springer: And furthermore, it is history now, what rate of return Hope Natural Gas Company realized.

Mr. Cockley: So is original cost history.

Trial Examiner: Yes, the studies that the Commission's staff submitted aren't confined to the present.

Mr. Springer: It is reasonable return because the rate of return determination is controlled by current economic conditions.

Trial Examiner: Well, it occurs to me that the question might arise as to the reasonableness of the return received by the Company over the period of its history in connection with some of the problems here.

Mr. Slaff: Well, I don't understand that that is the purpose for which this testimony is offered, Mr. Examiner.

—5209—

Mr. Cockley: No, that isn't the purpose for which it is offered.

Let me put it this way: As I conceive original cost, if we are going to original cost in any respect as a rate base,

then we have got to, at the same time, take its Siamese twin along with it, and that Siamese twin is the rate of return that the owners of property reasonably had a right to expect when they built or purchased the property at the original cost, if you are going to take it as a rate base. In other words, this isn't offered as a part of my case at all. This is offered in answer to the claim that these rates that we have are too high because on an operating experience we made so many dollars over a certain period of time, and that is claimed on the other side as being too much.

I am going to show that if you take original cost as a rate base, and accompany it with this Siamese twin, namely, the rate of return that the owners of the property reasonably had a right to expect when they invested their dollars in this original cost, in this plant at the original cost, you will find that the amount of money that they are earning is not too much, because that rate of return will be substantially higher than the rate of return fixed on today.

In other words, in a word my claim is this, and I leave it with that,—if you are going to take an up-to-date, present value of the property, that pays very substantial attention

—5210—

to reproduction cost and present day cost, then the right rate of return for it is the present, up-to-date rate of return reflecting modern money conditions, and under the tests that have been laid down by the Court.

If you are going back to a rate base that is an accumulated history over a long period of years, then the right rate of return to go with that is the historical rate of return that should accompany original cost, and you can't both deprive the owners of this property of the increased value of the property and at the same time deprive them of the rate of return that they reasonably had a right to expect at the time they invested their dollars in that property.

Mr. Springer: I can't follow Mr. Cockley. There could be no deprivation of property here on the present de-

termination of rate base and what a fair rate of return is. Past profits in this case, which were great—there don't have to be any past losses. Neither can be a dominant factor in the determination of rates for the future. That is pretty well established.

Mr. Cockley: I have said nothing about either profits or losses, and the Company had both.

Mr. Reeder: Mr. Examiner, may I ask that counsel for the Company state whether he proposes to show the actual cost of the money invested at the time the investment was made, or whether he intends to offer, through this wit-

—5211—

ness, some speculation as to what the cost of money should have been?

Mr. Cockley: Well, that is an interesting question, but I don't understand it.

Trial Examiner: Well, there is a very serious question in my mind as to the relevance of the evidence. I appreciate the right of the respondent to make up his record here for the purpose of arguing the questions. I think more serious harm could be done by its exclusion than by its inclusion. The objection is overruled.

Mr. Cockley: Read the last question and answer, please?

(The record was read by the reporter as follows:

"Q. Now will you state whether you have determined what you consider an appropriate rate of return for money invested by Hope in its plant for each year since the beginning, or have made some division of the entire period? A. Well, my investigation led me to make four divisions. It seems that the history of the Hope Company falls into four natural divisions—").

By Mr. Cockley:

Q. Before you pursue that further, Mr. Brown, let me ask you one or two more questions that go to the matter of your qualifications.

As I recall it, your testimony was that you entered the brokerage business in about 1909, was it, or 1908? A. January, 1909.

—5212—

Q. And your first position was with Hornblower & Weeks, was it? A. Yes.

Q. The firm of which you are now a partner? A. Yes.

Q. And that was in the Boston office, as I recall it? A. Yes.

Q. When were you made chief statistician? A. I was assistant statistician from the middle of 1910 until the fall of 1916, when I was made chief statistician.

Q. Now will you tell us what the duties of a statistician are, or what your duties as statistician and as assistant statistician were, just generally? A. Well, the analyzing and reporting to the firm and to individuals on hundreds of corporations, railroads, public utilities and industrials.

Collaterally I gave lectures to college bodies on current financial conditions. That wasn't exactly a part of my duties, but they covered the whole range of securities held by the public, advising individuals and the firm.

As chief statistician I was the chief investigator for a number of years of corporations looking for financing by our firm.

Q. State the fact as to whether or not your duties, both as statistician and assistant statistician, required you

—5213—

to keep yourself informed, currently at least, as to the conditions of the money market, the financial conditions generally, and other factors that enter into a consideration of rate of return? A. They did, and I might add that down through the years I made a considerable study of past conditions, going back to perhaps 1890.

Q. And when was that done? A. When I was chief statistician.

Q. What did you study during the period from 1890, at that time? A. General financial conditions of the country.

Q. Markets? A. Markets for all kinds of securities.

Q. Prevailing prices at various times? A. General prices, not specific prices particularly, as many of the stocks that we have today date only back to 1899 and later years.

Q. Do you consider yourself fairly well informed and familiar with the period from 1898 down to date as to general financial conditions, prices of securities, and other factors that would enter into a determination of a rate of return?

Mr. Slaff: That is an objectionable question, Mr. Examiner. The facts must speak as to whether the witness is qualified, and not whether the witness himself considers

—5214—

himself qualified. That is thoroughly irrelevant.

Mr. Cockley: I beg your pardon, but it is a perfectly usual question to put to an expert witness, whether he himself feels that he is qualified to express an opinion upon the subject on which he is asked to express an opinion. I have heard it asked many, many times in all kinds of courts.

Trial Examiner: If he didn't think so, he wouldn't be here.

Mr. Cockley: Well, that is probably so, but the question has been raised whether he can go back to this period.

The Witness: Perhaps I can answer that by a simple statement, that I have trained many bond salesmen and have lectured to them on the year-by-year changes in current conditions from the early 90's on. I don't know whether that qualifies me or not.

By Mr. Cockley:

Q. Now, Mr. Brown, you said you found that this rate of return investigation fell naturally into four periods.

Will you tell us what the first period is, and why you have selected that as a period? A. The first period seems to be from 1898, when the Company was formed, down to and including 1907.

During that period a very substantial part, the bulk of the sales of gas were known as field sales to gas and oil companies in West Virginia during that boom period in

—5215—

West Virginia.

By 1908, this proportion had dropped until about three-quarters of the gas sales were to commercial and domestic consumers.

Secondly, in May 1908, the Company issued a block of stock to refinance, in permanent form, the advances made by the parent company.

Thirdly, in May 1908, the Company paid its first cash dividend.

So that the period from 1898 to 1907 represents what I might call the early development period of the Company's history.

Q. And what, in your opinion, was the fair rate of return that the owners had a right to expect on money invested in plant account during this early development period?

Mr. Reeder: I object, and may the record show an objection to this question upon the ground that it calls for a conclusion which is proper only for the Federal Power Commission and not for this witness. It calls for no fact and no matter which this witness is especially qualified to testify upon as an expert.

It may well be that if counsel intended to show the actual cost of money to this Company at the time the investment was made, that would be a proper analogue to the original cost, but as I understand it, what he is now

—5216—

calling for is to have a series of rate cases over 40 years

and have this witness express a conclusion for the Commission only upon each one of those four or five periods into which he has divided that vast period of time.

I submit that that kind of inquiry is entirely and wholly irrelevant, immaterial and incompetent.

Trial Examiner: That was my thought exactly with respect to the qualifications of this witness to answer such a question as that. It doesn't seem to me that he is qualified as an expert for the purpose of determining what a reasonable rate of return might have been to that Company back in that period.

Now if you want to show what the cost of money was during that period, that is a different thing.

Mr. Cockley: Well, Mr. Examiner, it seems to me that perhaps we are confused by words a little bit. Can there be any doubt that a man of Mr. Brown's broad business experience and investment experience is perfectly qualified to say, during a development period of a new enterprise, as this was, as to the earnings that would have been demanded by investors to put money into that enterprise? That is the question I have asked him.

Trial Examiner: If you want to ask him that question, go ahead.

Mr. Cockley: Well, that is the question that I under-

—5217—

stood I did ask him. Perhaps I used "fair rate of return" in place of it. Let me rephrase the question.

By Mr. Cockley:

Q. In your opinion, what prospective earnings on their money would investors in that period have demanded in order to put money into the plant of such a property as the Hope Company?

Mr. Reeder: I want to object to that question upon the ground that it is an incomplete question and wholly unintelligible, standing alone. If counsel wants to go into

the question of what return the investor would demand upon his money for some specific period of time, which came down to and included the present, that might be material, but if he is going into the question of what return the investor demanded in 1902, that, I submit, is entirely irrelevant and immaterial to this inquiry.

Why should this Commission go into an historical study of that kind and into evidence that might have been relevant to a rate case in 1902?

Now I am objecting to this question as it stands, as irrelevant and immaterial to this inquiry.

Trial Examiner: Well, I think we have gotten right back to the original question.

Mr. Reeder: No, Your Honor, I am objecting now upon the ground that this question doesn't include any period of time. He says, "What rate of return would they demand"—

—5218—

Trial Examiner: (Interposing) In the period beginning 1898 to 1907, as I understand, or 1908.

Mr. Cockley: That is right.

Mr. Reeder: Does he mean for their investment for that period only, or for their investment from that period down to 1941, because that is the period of time that we are interested in.

Trial Examiner: I realize that, of course, and as I said before, there is a very serious question in my mind as to the relevancy of this evidence, but I have already in effect ruled on that.

The objection is overruled.

Mr. Slaff: It is understood, Mr. Examiner, that our objection extends to this entire line of inquiry, so that we need not repeat it specifically?

Trial Examiner: Yes, that will be understood.

Mr. Reeder: And may we have an exception?

Trial Examiner: You may have an exception.

Mr. Reeder: And may it be understood that our objection and exception runs to all this line of inquiry?

Trial Examiner: That will be understood, yes.

Proceed.

The Witness: May I have the question read, please?

(The question was read by the reporter.)

The Witness: Not less than 15 to 20 percent.

—5219—

By Mr. Cockley:

Q. Will you state the factors that you took into consideration in arriving at that opinion? A. In the first place, this was a relatively new industry, it was a brand new enterprise in a young industry. There was substantially no growth in the natural gas industry until the late 80's, and the 90's showed a recession, largely due to the depression.

The history of the industry through the 80's and the 90's showed exploitation of local fields very largely, which were promoted by, in a few cases, municipalities, or a few public spirited citizens, or an occasional pioneer operator.

Those fields, in most instances, gave out. The only fields that continued were in Western Pennsylvania and in West Virginia, and a portion of Indiana.

As recently as December, 1903, the Ohio State geologists wrote an annual report which was very discouraging on the future of the natural gas industry.

Secondly, there had to be new markets developed. As I stated before, the first few years showed sales very largely in the field.

Thirdly, with the local fields only being exploited, a high rate of return was necessary to attract capital.

Fourthly, there was practically no transmission of gas beyond the local fields. The transmission of gas was in its

—5220—

infancy, at least.

Fifthly, the Standard Oil Company, in its history, showed a net return on its net assets of about 25 percent during that period, and I can't conceive of a Board of Directors investing in a new mining enterprise for less than 15 to 20 percent, when it was already showing a 25 percent return on its own assets.

Q. Now what is your next period, Mr. Brown, that you have taken, and why have you taken that period? Give us the reasons why you have taken that as the second period? A. The second period I call from 1908 to 1926, both inclusive.

The Hope Company had passed from its early development stage to what might be called a certain stage of maturity and permanency. There were several issues of bonds put out during this period, notably in 1917, the Southern California Gas Company, and many issues since. I quote that company because for many years it has been regarded as the highest grade natural gas company in the United States, and the only company which has ever issued a Aaa Moody rating bond.

Secondly, I end the period in 1926 because at about that time, through improved electric welding and other processes, there were long distance pipe lines from the western and southwestern fields to the large markets, St. Louis, Chicago, Minneapolis, Detroit, and so forth.

Q. And on what terms could new capital be attracted,

—5221—

in your opinion, to invest in a natural gas business such as Hope's, during that period? A. In my judgment, you could not attract capital into an enterprise like Hope, which remained essentially a mining enterprise, very much on all-fours with a mining company of the better grade like Anaconda and Kennecott and Phelps-Dodge, or like the oil-producing companies—for less than 12 percent during that period, and some more than 12 percent in certain of those years.

Q. Now will you state the considerations that lead you to that opinion? A. During a large part of that period the average return or the average earnings price ratio of mining and smelting companies was 13 percent, and the average earnings price ratio of oil-producing and refining companies was 14 percent. The period started out with a panic and a depression in 1907-1908; good business in 1909; then a period from 1910 to 1913 which was below normal, with the exception of a few months in 1912. 1914 was a very bad year, with business at a low ebb; it was impossible to float any securities of any kind except the very highest grade. The Stock Exchange was shut down for 4 or 5 months in the latter part of the year.

Then came the World War boom, which started in the spring of 1915, and virtually continued to the middle of 1920, but it was essentially a common stock period, although

—5222—

there were a few bonds issued, but practically no preferred stocks, and the earnings price ratio on those common stocks was quite high.

Then came the so-called inventory panic of the fall of 1920, with the depression lasting through 1921, with great difficulty in financing anything.

In 1921, the Southern California Gas Company put out two issues at better than a 7 percent yield basis, but only bonds of high grade could have been floated in 1921.

Mr. Knapp's Chart No. 1 in Exhibit 82-A, shows Moody Aaa bonds above 6 percent as compared with less than 3 percent today, and Moody's Baa bonds, yielding above 8 percent, as compared with approximately 4½ percent today.

Then the period 1922 to 1926 was more normal, with a slight variation in 1923 and 1924, and good business in 1925 and 1926; but the rate of return was much higher during that period than it is today.

Q. During which period? A. From 1922 to 1926; in fact, during the whole period from 1908 to 1926.

Thirdly, the leading handbook on bonds, as recently as 1927, cautioned the investor with respect to bonds of natural gas properties, due to the prospective exhaustion of their supply.

So I rank the reasonable over-all return which an in-

—5223—

vestor would expect during the whole period, averaging it together, as not less than 12 percent, and in some of those years higher than that.

Q. Mr. Brown, will you state the fact as to whether or not the financing of natural gas companies during that period was a matter of private investment or accomplished through the public flotation of securities? A. There was occasionally a bond issue of relatively small amount sold in local markets, but not in national markets, dating back to 1900, on natural gas properties. I don't know of any preferred or common stock on a natural gas company that was floated by underwriters to the public until the end of this period.

There was a market for several issues which had been put out to the stockholders through early mergers—the National Fuel Gas, for instance. The earliest market I can find on Southern California Gas was 1923.

Q. Now are you talking about preferred or common? A. Preferred. The common was all owned by Pacific Lighting, which in turn had a common stock that was outstanding, but it also included electric properties.

So that my answer to your question would be that in this period, Hope might have been able to float an issue of bonds during several of these years, but could not have floated any bonds during other years in this period. It

—5224—

might have put out a common stock during a portion of that period, particularly in 1916, 1917, 1918 and 1919. It could

not have floated any common stock in 1920 or 1921. It might have been able to in 1922; it is very doubtful if it could in 1923 or 1924. It might have floated some common stock in 1925 and 1926. I doubt if it could have floated any preferred stock during any of those years.

Q. You have referred several times to the fact that it could put out an issue of bonds or could have sold some common stock. I ask you if there was any time during that period that it could have substantially recapitalized the corporation with new capital by the flotation of various classes of securities, such as is common today? A. No, sir, it could not. That is one reason why I ended the period at 1926, and when I come to my third period I will explain that.

Q. Now is there anything further you want to say concerning this period from 1908, your second period, to 1926? A. No, sir.

Mr. Slaff: Before you leave that, will you be good enough to state the name of the leading handbook to which you referred as cautioning investors about natural gas securities because of the possible exhaustion of the fields?

The Witness: The Principles of Bond Investment, by Lawrence Chamberlain, 1927 edition.

—5225—

By Mr. Cockley:

Q. Mr. Brown, will you tell us what your third period is, and why you have selected that? A. My third period is 1927 to 1934, both inclusive.

This period witnessed a widespread extension of market areas due to the long distance pipe lines. That aroused the interest of the investment banker and the investing public.

Prior to this period, there had been only occasional issues of bonds on natural gas properties. After the period started there were many issues of securities, with increased interest on the part of the public, and an in-

creased or rising quality rating of natural gas properties in the minds of the public.

The period includes the boom years of 1927, 1928 and 1929; the deep depression following the panic in the fall of 1929, and only a partial recovery in 1934. The reason I stopped at 1934 was because that was substantially the end of the normal money market, or the market for normal money rates.

Q. Well, in your opinion, on what terms could the capital requirements of the Hope Company during this period have been financed? A. The Hope Company still remained essentially a mining enterprise, and in my judgment could not have raised capital on an over-all basis of less than 10 to 11 percent, and it could not have refinanced itself in total during some of those years.

—5226—

Q. And will you tell us any other considerations that lead you to this opinion, other than you have mentioned? A. While the years 1927, 1928 and 1929 were boom years, and it was essentially an era of common stocks, it might have been possible to have issued some bonds on the Hope property. At no time during the period would it have been as sound to have put out bonds as it would to have had an all common stock capital structure, and at no time during the period could it have sold stock for less than an 8 percent yield to the public, with a 2 percent addition, carried to surplus, and much of the time it couldn't have sold common stock at any price.

Q. Well, is it your testimony that the most favorable terms it could have obtained during that period were the basis you have just described? A. It is.

Q. What is the fact during the few years when you say it might have sold a small issue of bonds—and, I suppose, or a small issue of preferred stock— A. (Interposing) That is correct.

Q. Was there any time during that period that it could have sold both with economy? A. No, there was no time during the period, in my judgment, where it could have put out three classes of securities.

—5227—

Q. And would there have been any economy in the cost of money to the Company for refinancing its needs, of putting out a small issue of bonds or preferred stock, with the balance common? A. Of course, bond money costs less than stock money, but in my judgment the saving by putting out a relatively modest amount of bonds would be more than offset by the higher cost of the common stock which necessarily carries a higher yield when it has senior securities ahead of it. So I see no net saving by financing during this period with bonds and common stock.

Q. Am I correct that your testimony, then, is that during this period this was a straight common stock risk? A. In my judgment, yes.

Q. Now what is your final period, and why have you selected that? A. My final period is from 1935 to date. The chief characteristic of this period has been the constantly declining money rates. That is very clearly shown in Mr. Knapp's exhibit. At the same time, there is a second factor there which I brought out a year ago in my direct testimony. There has been an improvement in the rating of senior securities of natural gas bonds during the past 3 or 3½ years.

Before this period, nearly all natural gas bonds ranked below, in rating, those of artificial gas bonds. The spread

—5228—

between those issues has now narrowed, and the first mortgage bonds of the higher grade natural gas companies now have a high investment rating. There are several issues carrying Moody's rating of Aa.

Q. And on what terms, during this period, is it your opinion that the financial requirements of the Hope Com-

pany could be met? A. In my testimony a year ago, I said not less than 8 percent, and I still stand by that.

Q. For the whole period? A. For the whole period.

Q. And are the reasons— A. (Interposing) The reasons are set forth in my prior testimony.

Now since January 1941, there has been a dip and a partial recovery in the price of bonds. There has been an improvement in the price of preferred stocks. There has been a very substantial dip in the price of common stocks of all utilities. So that the net cost of financing a utility today by bonds, preferred and common stock, in my judgment is slightly higher than it was on January 1. It certainly is not any lower, because the higher yields on common stocks today more than offset the improvement in preferred stock prices, with resultant lower yields, and the substantially no change in bond yields.

Q. How does the earnings price ratio of common stocks

today compare with what it was, say, a year ago, or when you testified in June of 1940? A. The earnings price ratio of utility common stocks today is higher than it was a year ago.

Q. That is, you mean the price is lower? A. The price is lower and the yield is higher.

Q. The yield is higher? A. Yes.

Q. Than it was at the time you testified in the summer of 1940? A. That is correct.

## WRITTEN STATEMENT OF GEORGE I. RHODES

### 1. Scope Of This Exhibit

This exhibit sets forth and explains an engineering determination of the necessary annual allowances or rates for depreciation required to reimburse Hope Natural Gas Company for the annual depreciation suffered by its:

A. Production system structures
B. Production system pipe lines and appurtenances
C. Transmission system structures
D. Transmission system pipe lines and appurtenances
E. Compressor station equipment
F. General structures
G. Office furniture and equipment
H. Warehouse, shop and laboratory equipment
I. Telephone and telegraph system

This determination is based on the actual depreciation experience of the Company from the beginning of business through 1938.

The property has been classified as above shown to meet the limitations of the Company's records of early depreciation experience. The appurtenances to pipe lines referred to above include rights of way and measuring and regulating equipment.

Allowances for drilling and cleaning equipment and for automobiles and trucks have not been determined in this exhibit because the depreciation on such equipment is now reflected in operating expenses through clearing accounts or their equivalent. Allowances for depreciation of wells, leaseholds and natural gas rights have not been determined in this exhibit, the necessary annual allowances for depletion of these properties being set forth in a separate Company exhibit containing the rate statement.

—3—

## 2. Total Depreciation Suffered By The Company's Properties—Unrealized and Realized

Depreciation inevitably begins to take place when construction of a new natural gas property is complete. Corrosion begins in its pipe lines. Other kinds of property begin to wear out or deteriorate in various ways. For a considerable time the resulting depreciation causes no replacements of any kind. It accumulates or accrues in the property. It can be determined only by an inspection and study of the property. This accrued or accumulated depreciation is later herein referred to as "unrealized depreciation" since it has not as yet caused retirement losses.

As a natural gas property becomes older some of its parts such as short sections of pipe lines located in the most corrosive soils depreciate to such an extent that they must be renewed or replaced. Equipment is moved from place for various causes in the upkeep of the property. Whatever may be the cause of replacements or movements from place to place, the Company incurs a loss which is realized through the retirement of property. Generally the loss is the difference between the cost of the property retired and its salvage value. This loss is referred to as "realized depreciation."

If a natural gas property is inspected and studied before any property whatever has been retired or renewed the unrealized depreciation disclosed by inspection is the total depreciation suffered by the Company. After retirements have been made, however, an inspection and study disclose only that part of the total depreciation suffered which has not been eliminated by renewals.

—4—

The total depreciation suffered by the Company's properties is thus the amount of the unrealized depreciation found by inspection and study to have accumulated in

the property, plus the amount of realized depreciation previously experienced as ascertained from the Company's records.

### 3. Basic Method Used In This Exhibit

The basic method used in this exhibit is to determine first the total amount of depreciation that has occurred in the Company's properties from the beginning to December 31, 1938, both unrealized and realized. If this total were divided by the total years the property was in service it would give the average annual amount of depreciation. Dividing this average annual amount by the average annual cost of the property exposed to depreciation would give the average annual rate as a percentage. This percentage, had it been applied to the undepreciated cost of the property from the beginning of its history to December 31, 1938, would have provided sufficient money to provide for all retirement losses experienced and would leave in the depreciation reserve on December 31, 1938 a sum equivalent to the accrued depreciation found to exist on that date.

Mathematically, of course, precisely the same percentage will be found by taking the total amount of depreciation, both unrealized and realized, for the entire period and dividing this by the sum of the costs of the property exposed to depreciation at the beginning of each of the years of exposure. This sum is sometimes referred to by accountants and others and later herein as the "dollar-years exposure to depreciation." This simpler computation is used in this exhibit.

—5—

This basic method coordinates the Company's experience in the past both as to losses realized on the retirement of the property up to December 31, 1938, and the unrealized depreciation accumulated in the property as of that date, as set forth in a separate Company exhibit. It

produces a complete correlation of annual and accrued depreciation.

While the basic method is easily understood, the application of it for various reasons needs some further explanation. Accrued or unrealized depreciation existing on December 31, 1938, has been determined and set forth in a separate Company exhibit in terms of reproduction cost. The realized depreciation on the other hand has of necessity been determined on the basis of the Company's book retirement losses. Likewise the only available measure of the cost of the property at the beginning of each year from 1898 through 1938 is the cost heretofore capitalized on the Company's books, called "book cost" in this exhibit. In order, therefore, that the true percentage of depreciation may be determined these book costs have been converted into terms of reproduction cost.

In view of the Company's practices in recording current depreciation and particularly the requirements of the new system of accounts it is necessary to make certain adjustments to the book figures appearing in the Company's records which are explained in subsequent paragraphs.

### 4. Adjustments of the Company's Book Figures Related to Depreciation

The Company's past depreciation records were analyzed in detail from the commencement of business in 1898 to the end of 1938, including original vouchers and

entries relating to retirements and retirement losses. Care was exercised to eliminate the effect of transfers from one account to another, to eliminate charges resulting from restoration of materials to the warehouse at less than book cost, and to eliminate errors in the charges. The results of this detailed analysis are summarized on Tables G to N at pages 25 to 32 of this exhibit. These tables show

for each year for the several classes of property as grouped in this study the Company's retirements and retirement losses per books. They also show the cost of these properties as heretofore capitalized on the Company's books at January 1 of each year. These book figures constitute the basic data on which realized depreciation has been determined and adjusted in this exhibit.

The Company's past book depreciation figures differ from current requirements or otherwise require adjustment in four particulars:

(a) There have been some items of property retired from service whose retirement on the books has been deferred. These are called "deferred retirements" in this exhibit.

(b) A full determination of depreciation experience requires consideration of the depreciation on purchased property before the date of purchase.

(c) In pipe line accounts labor has usually been retired and charged as depreciation only in the case of lines lifted and not replaced. Present practice requires charging to depreciation the labor of installing all materials retired.

(d) For many years the cost of abandoning property has been charged to operating expense. Present practice requires charging to depreciation the cost of abandoning all property retired.

—7—

The basic methods of adjusting the book figures for these matters and correlating them with the accrued depreciation found to exist in the property at the end of 1938 are described in the succeeding subsections.

*(a). Adjustments for deferred retirements*

* * * * *

—8—

*(b). Adjustments for purchased property*

* * * * *

—9—

*(c). Adjustment to reflect full retirement of labor costs*

* * * * *

—11—

*(d). Adjustment for cost of abandoning property*

* * * * *

**5. The Company's Book Depreciation Figures Expressed In Terms of Reproduction Cost**

As heretofore noted, the figures as to the Company's past depreciation experience must be expressed in terms of the reproduction cost before they can be correlated with the accrued depreciation found to exist in the property at December 31, 1938. This is accomplished by the simple

—12—

operation of multiplying the appropriate depreciation figures in terms of book cost by the ratio of the reproduction cost of the property as of December 31, 1938 to the book cost of the property at that date. These adjusting factors are determined on Table F on page 24.

**6. Determination of the Company's Retirements and Realized Depreciation**

The data as to the Company's total book retirements and the adjustments to these book figures are shown by Table C at page 21.

* * * * *

The amount of realized depreciation (retirements less salvage) suffered by the Company over the years has been determined from its records and from the adjusted retirements shown in Table C. This determination is shown by Table B on page 20.

* * * * *

—13—

**7. Determination of Unrealized Depreciation**

The unrealized depreciation existing in the Company's properties at December 31, 1938 in terms of reproduction cost is stated for the various classes of property on Table D. In this table column (1) lists the several classes of property. Column (2) shows the reproduction cost at December 31, 1938 as taken from the Company's reproduction cost exhibit. Column (5) shows the accrued or unrealized depreciation existing in the several classes of property at December 31, 1938 as found by inspection, observation and study of the properties as set forth in a separate Company exhibit. Column (4) expresses this existing accrued or unrealized depreciation in percentages of the cost new.

—14—

**8. Determination of Dollar-Years Exposure to Depreciation**

The determination of the dollar-years exposure to depreciation for the several classes of the Company's property is shown by Table E.

* * * * *

**9. Determination of Necessary Annual Depreciation Rates**

All of the elements entering into a determination of the necessary annual allowances or rates for depreciation

—15—

are described above together with the adjustments applied to book figures to make them applicable to the methods currently required to be followed in handling depreciation. The determinations of the necessary annual allowances for depreciation are all made on Table A.

Column (1) shows the class of property for which the annual allowances or rates of depreciation are determined. As explained above, these classes of property were defined by the limitations of the early retirement records.

Column (2) shows the total realized depreciation suffered by the property taken from column (8) of Table B.

Column (3) shows the amount of unrealized depreciation accumulated in the property taken from column (5) of Table D.

Column (4) shows the total depreciation suffered by the Company to December 31, 1938. It is the sum of the realized depreciation, column (2), and the unrealized depreciation, column (3), for each class of property.

Column (5) shows the dollar-years exposure of the property to depreciation taken from column (9) of Table E.

Column (6) shows the final determination of the necessary annual allowances or rates for depreciation expressed as a percentage applicable to cost new. It is the result obtained by dividing the total dollar amount of all depreciation suffered to December 31, 1938 shown by column (4) by the total dollar-years exposure to depreciation up to that date as shown by column (5).

Column (7) shows the corresponding rates applicable to the depreciated cost of the property determined by dividing the rates in column (6) by the per cent condition of the property as shown in column (3) of Table D.

—16—

The annual rate of depreciation of telephone and telegraph system property could not be determined by the above method because the Company has recorded no realized depreciation of this kind of property. A study of pole replacements and the condition of the property as inspected indicates that 4.0 per cent per year is a fair allowance for depreciation applicable to reproduction cost new and 5.9 per cent per year applicable to reproduction cost new less depreciation.

In summary of Table A the necessary annual allowances or rates of depreciation applicable to costs new and less depreciation of the several classes of the Company's property are as follows:

| Class of Property | Annual Rate of Depreciation Applicable To Reproduction Cost | |
|---|---|---|
| | New | Depreciated |
| A. Production system structures | 4.52% | 8.04% |
| B. Production system pipe lines and appurtenances | 2.04 | 2.71 |
| C. Transmission system structures | 2.64 | 3.67 |
| D. Transmission system pipe lines and appurtenances | 1.28 | 1.61 |
| E. Compressor station equipment | 1.76 | 2.17 |
| F. General structures | 2.59 | 3.55 |
| G. Office furniture and equipment | 3.41 | 4.87 |
| H. Warehouse, shop and laboratory equipment | 3.29 | 4.37 |
| I. Telephone and telegraph system | 4.00 | 5.88 |
| Average | 1.80% | 2.32% |

—17—

These annual rates of depreciation as heretofore stated are determined from the Company's actual depreciation experience over the entire history of its properties and correlate annual depreciation with the accrued depreciation deducted in the Company's exhibits from reproduction cost new. They constitute minimum necessary rates in that they provide for no contingencies except such as have occurred in the past.

Signed at Clarksburg, West Virginia, this May 20, 1940.

George L. Rhodes.

Table A

## HOPE NATURAL GAS COMPANY

### Determination of Necessary Annual Depreciation Rates

### Based on Realized Depreciation Up To December 31, 1938, Unrealized Depreciation Accrued at December 31, 1938 and Dollar-Years Property Has Been Exposed to Depreciation

| Classes of Property | Realized Depreciation to December 31, 1938 (From Table B) | Unrealized Depreciation at December 31, 1938 (From Table D) | Total Depreciation Suffered to December 31, 1938 | Dollar-Years Exposure to Depreciation (From Table E) | Necessary Annual Depreciation Rates Applicable To Reproduction Cost | |
|---|---|---|---|---|---|---|
| | | | | | New | Depreciated |
| (1) | (2) | (3) | (4) = (2) + (3) | (5) | (6) = (4) ÷ (5) | (7) |
| **Production System Property** | | | | | | |
| (1) Structures | $ 190,016 | $ 217,115 | $ 407,131 | $ 8,997,669 | 4.52% | 8.04% |
| (2) Pipe Lines and Appurtenances | 4,938,471 | 5,082,534 | 10,021,005 | 491,976,896 | 2.04 | 2.71 |
| **Transmission System Property** | | | | | | |

Notes: ( ) Parentheses denote red figures.

* The Company's figures appearing on this statement do not reflect any increase in rate base due to capital additions or increase in valuation subsequent to December 31, 1938. Also the Company expenses for the individual years 1937, 1938, 1939 and 1940 do not include the increase in taxes or payrolls which will be incurred in the future as shown by the testimony presented at the hearings commencing July 7, 1941, these increased expenses being reflected only in the 3 year and 4 year average figures.

(A) Including the nominal acquisition cost of leaseholds, gas rights and royalties and working capital, but excluding property used to transport coke oven gas and going concern costs or value.

## 22. TESTIMONY OF COMPANY WITNESS EUGENE P. SULLIVAN AS TO EXHIBIT NO. 126 SHOWING AVERAGE RETURN FROM THE COMPANY'S EXPORT BUSINESS, WEDNESDAY, JULY 16, 1941, RECORD PAGES 6198-6208, 6210-6212, 6215-6216, 6218, 6227.

—6198—

Mr. Milde: May I have marked as Exhibit No. 126 a statement entitled "Average Return from the Company's Export Business, 1937-1940, Based on the Company's Claims as to Rate Base as of December 31, 1938 and Operating Expenses"?

Trial Examiner: It may be so marked.

(The statement referred to was marked as Exhibit No. 126 for identification.)

DIRECT EXAMINATION by Mr. Milde (Continued).

Q. Mr. Sullivan, I hand you Exhibit No. 126 for identification, entitled as I have just stated, and ask you if you prepared the statement contained in this exhibit? A. I did.

Mr. Milde: Mr. Examiner, before I interrogate Mr. Sullivan about this statement, I would like to say just one thing: Our view of the case is that the normal average experience of the company is fully reflected by the company's operating experience during the years 1937, 1938 and 1939, and we have not heretofore put in figures for 1940 for that reason.

However, the Commission's staff has included figures for 1940, and in order that our figures could be compared to theirs, we have in this exhibit also set out the 1940 results

—6199—

of operation as we see them, and the average of the years 1937-1940, as well as the average for the three years I previously mentioned.

I just wanted to make that statement to make it perfectly clear that we do not intend, by offering this exhibit and some of the other subsequent exhibits, which set out our figures for 1940, to deviate in any way from our claim, which we think will be supported by the evidence, that the normal average operating experience of the company, on the basis of which future rates should be set, is fully and adequately revealed by the operating conditions and results of the three-year period, 1937-1939, inclusive.

Trial Examiner: These figures shown under 1940, then, in this exhibit, are not the same as the figures shown by Commission counsel's exhibit?

Mr. Milde: No, these are our figures for 1940, and we put them in, in order that they could be compared with the Commission staff's exhibit.

By Mr. Milde:

Q. Mr. Sullivan, will you explain very briefly what the statement in Exhibit 126 shows? A. This statement shows the average return from the company's export business during the period 1937 to 1940, based on the company's claims as to rate base as of December 31, 1938, and operating expenses.

—6200—

In arriving at net return from the export business, the revenue from the local sale of gas in West Virginia less specific distribution costs has been credited to production, transmission and general expenses.

Q. Is that the same method that the company used in its original rate statement, Exhibit No. 37 and— A. (Interposing) Yes, the figures appearing under the column headed "Average of Years 1937-1939" correspond with those presented in Company Exhibit 37.

Q. Let me ask you also, Mr. Sullivan, whether that method of handling West Virginia revenues as a credit against the cost of export gas, was not also used by Mr.

Dunn of the Commission's staff in Exhibit No. 90? A. It was. Mr. Dunn did set forth the results on the basis of the Commission examiners' rate base and expenses, in Exhibit No. 90.

Q. And that method assumes that the full contribution of the West Virginia business by way of revenues over and above specific expenses, should be applied in reduction of the cost of export gas? A. It does.

Q. Will you proceed with the explanation? A. Referring to the column headed "Average of Years 1937-1939," which is the same as that appearing in Exhibit No. 37, except as to the items of amortization of property re-

—6201—

classification expense and FPC rate investigation expense—

Q. (Interposing) What are the numbers of those? A. Those are items Nos. 15 and 16.

Q. And what is the difference? A. In this exhibit these costs are based on amortizing the total cost of these items over a 10-year period, and providing 8 percent interest on the unamortized balance.

Q. Well, you use there the figures that you show in Exhibit No. 125? A. That is correct.

Q. And in the company's original rate statement, you used, or Mr. Rhodes used, the 5-year amortization period? A. The 5-year amortization period applied to a preliminary estimate of this expense of $1,250,000.

Q. For the two expenses? A. Yes.

Q. Will you proceed? A. On line 25 is set forth the Federal income taxes at the rate of 24 percent, plus probably 6 percent surtax. The figures in this exhibit are based on those tax rates, while in Exhibit 37 they were based on the 18 percent tax rate which was in effect at the time Exhibit 37 was prepared.

Q. Well, in line 24, don't you show for the individual years the income taxes at the rates actually in effect? A.

—6202—

Yes, the figures for the individual years appearing on this statement are based on the tax rates and labor rates in effect, and in the three and four year average columns are included the taxes on the basis of the present tax rates, and the operating expenses have been adjusted to include the increase in pay rolls not reflected in these years' operating expenses.

Q. That was shown in one of Mr. Chisler's exhibits? A. Yes, that was taken from Exhibit No. 107 as to the increase in pay rolls, and Exhibit No. 109 for the increase in West Virginia tax in 1941 due to the increase in West Virginia assessment.

Trial Examiner: What exhibit was that last one?

The Witness: 109.

By Mr. Milde:

Q. Well, then, let me ask you if this isn't the substance of how these statements are set up.

For the individual years you show the operating results under the pay roll and tax rates that were actually in effect? A. That is correct.

Q. But when you average that expense to get some idea as to the future, you include present Federal income tax rates and the present West Virginia property tax payment, or the additional tax payment, and the present pay roll, rather than the pay roll in the past; is that the substance of what this is? A. That is correct.

—6203—

There are also some minor adjustments in the figures appearing in Exhibit No. 37.

—6204—

Q. Now, you have explained generally that your 1937, 1938, 1939 figures are the same as Exhibit 37, subject to these changes you have mentioned? A. That is correct.

Q. What are these 1940 figures? A. The 1940 figures were determined from the company's books, and all adjustments were made to conform with the adjusted expenses as previously presented in Exhibit 37.

Also, for the year 1940, the expenses have been adjusted to include the cost of the deep-test well chargeable to non-productive well drilling expense for 1940, as shown in the exhibit presented by Mr. Chisler, Exhibit 110.

Q. And except for any modifications you have made in your testimony just now, these 1940 figures are set up in the same general form as the company's figures for 1937 to 1939? A. They are.

On the last line of this statement, line 31, is shown the average return earned during the average of the years 1937 to 1939, on the reproduction cost new less depreciation of the company's production, transmission and general properties, in the amount of 2.25 percent.

Q. And what do you show for the year 1940? A. The year 1940 by itself shows a return of 6.98 percent, and the

—6205—

average return during the four years, 1937 to 1940, amounts to 3.27 percent.

Q. And are the notes on page 2 of this exhibit to be read as part of your statement? A. They are.

Mr. Milde: I offer in evidence Exhibit No. 126.

Mr. Reeder: May our objection be noted on the same grounds as to the previous exhibit?

Mr. Springer: May we have ruling reserved until cross examination is completed?

Trial Examiner: All right, go ahead.

Cross Examination by Mr. Springer.

Q. Mr. Sullivan, referring to Exhibit 126, on line 24, Federal income taxes on basis of tax rates in effect,—take the first column, for example, $324,758 for 1937? A. Yes.

Q. Is that the actual amount of taxes paid by the Hope Natural Gas Company in that year? A. No, the taxes paid have been adjusted to reflect the company's adjustments to operating expenses which would affect the Federal income tax. This computation is shown in a work sheet which will be presented as an exhibit.

Q. Do you conclude from your exhibit that the Hope Company would have paid more Federal income tax than it

—6206—

actually paid? A. This expense is based on the income tax the company would have paid if they received the additional revenues from gasoline royalties, and their operating expenses were reduced, due to reducing the price of coke-oven gas purchased from the Domestic Coke Corporation.

Q. Do you know whether or not the Hope Natural Gas Company plans to pay a deficiency assessment on its past taxes for 1937, 1938, 1939 and 1940, that you have indicated here? A. No, I do not, but I do think that if we consider for these years that they have additional revenue, that in order to be clear we must compute the additional taxes that would be payable on that additional revenue.

Q. Although you don't think the company will file an amended return and pay the additional taxes on the years you have set out in this exhibit? A. I don't know as to that.

Q. Now, the next line, line 25, Federal income tax at rate of 24 percent plus probable 6 percent surtax,—you show there in the column "Average of Years 1937-1939" the amount of $301,044, and in the column captioned "Average of Years 1937-1940" you show $507,580.

Has the company ever paid that probable 6 percent

—6207—

surtax? A. No, that probable 6 percent surtax is not yet in effect.

Q. Yet, you included in an average for the past years? A. But if the average for the past years is to be used in

testing the reasonableness of the rates in the future, the past years' expenses must be adjusted for known increases in taxes and pay rolls.

* * * * *

—6208—

Q. Did you hear the testimony of Mr. Tonkin that there is an unusual increase in the Hope Natural Gas Company's sales? A. I didn't hear Mr. Tonkin's testimony, but I do know of the increase in the sales. But I also have been informed that all that the present property could be expected to do was the experience that was achieved in the average of the years 1937 to 1939.

Q. Assuming that Hope Natural Gas Company's rates are reduced $1,000,000 on an annual basis, what kind of a test would your average figure give in that case? A. If the rates were reduced $1,000,000, I believe that the income taxes should be reduced 30 percent of that, or $300,000, which would leave an income tax of $1,044. Likewise, if they were increased $1,000,000, that tax should be increased to $600,000.

* * * * *

—6210—

Q. You didn't make any adjustments for known increases in revenues, did you? A. No, there is no adjustment to be made for known increases in revenues from the property as it existed at that period. By "existed," I mean the extent of the properties in this period.

Q. Well, you take for your exhibit future increases in expenses, but you ignore future increases in revenues? A. No, they haven't been ignored because it is the company's view that all that could be expected out of the property that existed on December 31, 1938 are sales that were apt to be experienced in that period.

Q. Of course, you know that the year 1940 showed a favorable operating result picture, about $5,000,000 on your

exhibit, in line 7, over the average of 1937 to 1939? A. Yes, I know that the sales for the year 1940 were substantially in excess of the average for the period 1937 to 1939,

—6211—

but this rate could only be maintained for a short period without substantial additions to the property.

Q. How do you know that? A. Well, I have been around these properties for about 10 years, and that is my impression, and while I am not testifying to it, it comes from discussions and what I believe to be so.

* * * * * *

—6212—

Q. Well, in your own exhibit, for the very next column, 1940, you show an increase in revenues, yet for your column average years of 1937 to 1939, you studiously include all known future expenses, but seem to leave out known increased revenues for 1940? A. Well, that is for the reason that it is our view that sales that were achieved during the years 1937 to 1939 would be all that the present property would be able to do; except for a short period of time, you would get a spurt in there, but you would have to make it up very shortly.

Q. Mr. Sullivan, in your column headed "Average of Years 1937-1939," and the figures appearing opposite line 25 and line 26 and line 28, which we have discussed as being expenses which will be incurred in the future, with an increase over the past years, they all affect your total in line 31, percent rate of return of 2.25 percent, do they not? A. Yes.

* * * * * *

—6215—

Q. Now do you think that you can set up an equitable standard for an average of any number of past years by taking into consideration only the known increase in operating expenses for the future, without taking into considera-

tion the known increases in revenues for the future? A. Well, the known increases in operating expenses and revenues, as applicable to the property as it existed at December 31, 1938, are reflected in this exhibit. There are going to be increases in expenses, but according to the testimony there will be no increase in revenues from the present properties, that is, those increases in revenues will only come through substantial additions to the present property.

Q. Do you know that there is an exhibit in this case comparing the first three months of 1941 with 1940 revenues, which shows a substantial increase in 1941 over 1940? A. I know that there is such an exhibit, yes.

Mr. Milde: For the first three months.

The Witness: Yes.

By Mr. Springer:

Q. You still didn't consider that in your Exhibit 126? A. Yes, it was given consideration at the time that this exhibit was made up.

—6216—

Q. Where does that appear in Exhibit 126? A. It is reflected by considering that, from the property as it existed in 1938, there could only be supplied from that property the average sales for the period 1937 to 1939, and any additional sales, except for a short period, would have to be supplied through substantial additions to the plant.

Q. Do you know whether or not there was any substantial addition to the Hope Company property in 1940 as compared with 1939, where your exhibit shows, in line 7, an increase in revenues of $5,000,000? A. I am not familiar with those figures, but I do know that if the sales continue at that rate, there will very shortly have to be substantial additions.

—6218—

Q. Now, Mr. Sullivan, did you deduct the accrued depletion from the rate base for your exhibit? A. No, the rate base used in this exhibit is the reproduction cost new less depreciation of the company's production, transmission and general properties as of December 31, 1938, and does not reflect any capital additions or increases in valuation due to increase in prices subsequent to that date, nor any additional accrued depreciation that has taken place in the company's properties since that date.

Q. And it reflects no retirements? A. No retirements and no additions.

* * * * *

—6227—

RE-DIRECT EXAMINATION by Mr. Milde.

Q. Mr. Sullivan, referring to your average columns for '37 to '39 and '37 to '40, as shown on page 1 of Exhibit 126, did I understand you to state that these increases in payrolls and this increase in Federal income tax rate, and increase in the unemployment tax, and the increase in the West Virginia property tax assessment are known increases in cost which have no reference to the amount of gas that the company might handle? A. That is correct.

Q. In other words, your view is that whether the company sells 50 billion, or 60 billion, or 40 billion, those expenses will be incurred irrespective—those increased expenses will be incurred irrespective of the volume of gas handled? A. Yes, I believe they will.

Mr. Milde: That is all.

* * * * *

## 23. COMMISSION WITNESS DUNN'S EXHIBIT NO. 90 ENTITLED: "Rate of Return Earned on Original Cost Base Years 1937 to 1940, Inclusive."

### Table of Contents

| | | Page |
|---|---|---|
| WRITTEN STATEMENT | | 1 |
| SCHEDULES: | | |
| No. | Description | |
| 1. | Rate of Return Earned on Original Cost Base, Years 1937 to 1940, inclusive | 6 |
| 1A. | Comparative Income Statement for the Years 1937 to 1940, inclusive, as Adjusted, Showing an Average Year for the Period [Not Printed] | 7 |
| 2. | Rate of Return Earned on Original Cost Base, Exclusive of Distribution Plant, Using Company Method | 8 |
| 2A. | Summary of Special Distribution Costs [Not Printed] | 9 |
| 2B. | Summary of Gas Service Revenues [Not Printed] | 10 |

## WRITTEN STATEMENT

The attached schedules have been prepared to summarize the plant costs, reserves and operating expenses for the four year period 1937 to 1940, inclusive, to show the profit earned and the rate of return on the original cost base. There are set forth certain rate adjustments proposed by the examiners which have not been made in the underlying exhibits, but are included here for the purpose of summarizing all costs expected to increase or decrease income in the future.

**Return Earned on Original Cost Base:**

Schedule No. 1 shows the average original cost base in the amount of $31,281,373. This amount includes production, transmission, distribution and general plant with the related reserves for depreciation and depletion deducted and the allowance for working capital added.

Net Operating Revenues are shown in the amount of $4,125,399 as the annual average for the four year period. The determination of net operating revenues, as adjusted, is shown by the income statements summarized on Schedule No. 1A. The expenses of the four year period are expected to serve as a guide for future operating costs; therefore, certain non-recurring expenses are not included in Schedule No. 1.

—2—

**Exploration and Development Costs:**

The actual costs and losses as set forth in accounts 510, 511 and 512 have been included as a deduction from net operating revenues for the four year period. Due to cancellations of unoperated acreage, delay rental cost is expected to be reduced in the future. However, the company is starting a program of exploratory deep drilling, and there is a known loss on the first of these deep wells of

approximately $200,000.00 due to a well completed dry in 1941. For this reason it is believed proper to include the full amount of exploration and development costs as shown.

**Interest on Unoperated Acreage:**

Interest on unoperated acreage has been included as a deduction from net operating revenues. The investment has been classified as Gas Plant Held for Future Use which is not included in Gas Plant in Service. The examiners propose the allowance in operating expenses of interest as a carrying cost of the investment. A rate of 6% has been used pending the decision by the Commission as to a fair rate of interest.

The minor adjustment on Gas Plant Held for Future Use relates to adjusting entries 338 and 342, Exhibit No. 57A. Certain wells and field lines not used in prior years were placed in service in 1940.

It is proposed to amortize property reclassification and rate case expenditures over a period of ten years, being a period of six years in the future.

—3—

**Adjustment of Income Taxes:**

The income taxes actually paid were included in the taxes account. This adjustment removes the Federal Income Taxes pending the determination of a fair return by the Commission and the computation of the indicated taxes on income at the latest tax rate.

For Federal Income Tax purposes certain deductions and allowances are made which are not recorded on the books or set forth in the examiners' income statements. To illustrate a method for the Commission to use in estimating an allowance for future income taxes, giving effect to whatever reduction in revenues may be ordered by the Commission, the following tabulation is submitted:

| | 1937 | 1938 | 1939 | 1940 | Average |
|---|---|---|---|---|---|
| Income Taxes Paid | $ 282,315 | $ 17,515 | $ 191,524 | $ 912,313 | $ 350,916 |
| Income Tax Rate | 14.9386% | 16.5% | 16.5% | 24% | — |
| Net Taxable Income | $1,889,830 | $106,150 | $1,160,733 | $3,801,304 | $1,739,504 |
| Assumed Reduction (for illustration only) | | | | | 1,000,000 |
| Revised Net Taxable Income | | | | | 739,504 |
| Tax Rate in Effect | | | | | .24 |
| Allowance for Income Tax (illustrative only) | | | | | $ 177,481 |

Schedule No. 1 shows the annual average return earned in the amount of $3,809,201 and the average rate of return earned on the original cost base as 12.18%.

—4—

**Return Earned on Original Cost Base, Exclusive of Distribution Plant, using Company Method.**

The company's method of determining return applicable to interstate sales avoids an allocation of costs to West Virginia domestic and industrial consumers. The rates to these consumers are subject to West Virginia regulation, and such sales amount to less than 20% of the total.

Company Exhibit No. 37 sets forth certain reasons why the method of crediting the revenue received from the local distribution of gas in West Virginia in excess of specific distribution costs to the production, transmission and general costs, should be adopted.

> "The return is worked out on the premise that the Company's local West Virginia business is unavoidable in carrying out its major business of exporting gas from West Virginia; and that these local sales being subject to West Virginia regulation, the remainder of the gross revenues therefrom after deducting specific distribution costs, is the full contribution of the West Virginia consumers towards the costs incurred jointly on account of all gas sold. The cost of the gas exported from the state is thus the Company's total production, transmission and general expenses after crediting this remainder of the revenue from

local distribution of gas after deducting specific distribution costs.'"

Schedule No. 2 sets forth the plant costs, revenues and operating costs which are taken from the other accounting exhibits. Schedule No. 2A shows the gas service revenues other than interstate sales and the specific costs which have

been deducted. Return is computed at an assumed 6% on net original cost of distribution plant, including an allowance for working capital.

Schedule No. 1 shows the annual average rate of return earned at 12.18% on the total base as compared with 12.53% on the interstate base, shown by Schedule No. 2. The difference in return earned and the rate is $104,535, representing the return on distribution plant included in Schedule No. 2.

Washington, D. C.
June 2, 1941.

## 24. TESTIMONY OF COMPANY WITNESS LORING L. TONKIN AS TO ABILITY OF THE COMPANY TO MEET WAR DEMANDS, SATURDAY, JULY 12, 1941, RECORD PAGES 5764 TO 5771.

—5764—

By Mr. Cockley:

Q. Mr. Tonkin, have you in mind any other capital expenditures made by the Hope Company during these years other than those set forth in these, as related directly to your present production, transmission, and general property as set forth in this exhibit? A. Yes, we have. These would be our normal expenditures, but we have in mind, as I told you, on this year's budget, I had another $100,000 that I haven't had approved, but I have already authorized the expenditure.

We are finding ourself in a rather peculiar situation. Our normal sales of gas of the Hope system go around

—5765—

52,000,000,000 feet of gas a year. I think around 51,500,000,000. The average for the last 10 years has been slightly under 50,000,000,000 feet, and that has been running along for years.

You take the 20 year average. We have settled in our own mind that a normal year for the Hope Company is right around 52,000,000,000 feet sales.

Now, we come to the point where our sales in 1940, due largely to increase in industrial sales due to the emergency for the preparedness program, have jumped very rapidly, far beyond what we could have anticipated for gas reserves and gas supplies.

In other words, in 1940 we sold approximately 65,000,000,000 feet compared to a normal year of less than 52,000,000,000.

Q. Now, you are not including in any of these figures the sales by the old Reserve Company? A. Anything I am talking about today does not include anything in the Reserve Gas Company property.

Q. All right. A. As I say, in 1940 we actually sold almost 65,000,000,000 feet. Just slightly under 65,000,000,000, and in 1941 it looks like we are going to sell in excess of 70,000,000,000 feet.

Now, when you jump from 52,000,000,000 to 70,000,-

—5766—

000,000, within a year and a half, or two years, you might say, you are drawing on your reserves more than we could have foreseen several years ago and, therefore, we have to do something else to replace that if we are going to take care of our customers.

Q. Is it possible for you to replace that gas in West Virginia? A. It is not.

Q. What is going to be your situation as to supply in West Virginia, assuming that that demand that you have spoken of is maintained? A. Well, the supply in West Virginia is at its peak right now as far as any gas the Hope Company can get its hands on.

The Oriskany field in Kanawha county, rock pressure is dropping off.

This summer we have not been able to get accurate figures on it, but I would say the rock pressure was dropping off from a pound and a half to two pounds a day in the Oriskany field in Kanawha county.

Everybody is drawing on it. We are drawing very heavily on it, United Fuel and other people.

—5767—

Q. What do you estimate you will get out of the Oriskany Field this coming winter? A. We expect to get probably 72, maybe 75 million feet of gas a day out of that Oriskany Field in Kanawaha County.

Q. You mean a peak delivery of approximately that? A. No. We are taking better than 80 million right today out of it.

Q. This coming winter you expect that to drop to 72 million? A. That will drop to 72, and we hope it will hold up to 75.

Q. And how much can you count on for the following winter? A. The following winter, the best we can judge—we have had our superintendents out watching the decline all around—and we will not get out of that field, in my estimation, over 30 or 35 million feet a day the year after this winter we are coming to.

Q. Now, Mr. Tonkin, what is your solution of this problem? A. Well, the solution of the problem—and we have already started on it—and that is where my hundred thousand dollars comes in—we have started a survey from Cornwell Station down through that part of West Virginia,

—5768—

southern West Virginia, through the entire state of Kentucky, the entire state of Tennessee, the entire state of Mississippi, the corner of Arkansas, in northern Louisiana, with a survey. We have eleven crews on the job now and have been on the job since early in May.

The survey is either half or a little over half completed. Right of way crews are right with the surveyors, and we are for a prospective line to Louisiana, making that survey and later drawing on the fields—that is, northern Louisiana; I am speaking of Monroe, Louisiana, field—and later drawing on the gas from East Texas and the Gulf Coast of Louisiana, where there are enormous resources of gas in that region.

Q. Well, how far, at present, are you contemplating building that line? A. The line will be approximately 826 miles long, 20 inches in diameter and built for high pressure.

Q. Built for high pressure? A. Yes.

Q. And what do you estimate that line will cost? A. Approximately 25 million dollars, if we stop at Monroe, Louisiana, field.

Q. And that includes, I presume, the compressor stations and the other appliances that are necessary to put

—5769—

the line into effect. A. That includes the compressor stations, the five relay stations, and one field station on that line, a total of six at the present time.

Q. Will you tell me what the fact is as to whether or not you are building that line in order to serve markets other than those that you are now serving, your company and your affiliated companies? A. No. We are building that line to serve the markets of our customers. The fact of the matter is we have been thinking of this line for some time, but we did not think we would have to build it for another five years, but this severe demand upon us, that we have struck in the last year and a half, you might say, and apparently is continuing on through '41, due to the emergency of the preparedness program, has drawn down on our reserves for peak loads, I might say—that we find that we have got to jump ahead of ourselves if we are going to supply our customers.

In other words, we have been through this period once before. After the last world war, during the world war and shortly after, we had enormous demands upon the Hope Company for a supply of gas, due chiefly to industrial war demands, you might say.

We depleted our reserves very rapidly in those days and from 1919 to 1925 we had to spend, on account of this depletion, or the lessening of our ability to deliver—as

—5770—

maybe you better word it—we had to spend between 7½ to 8 million dollars over and above our normal capital expenditures, to go to southern West Virginia, to replenish our gas supply.

Now, that was caused by depleting our supplies, due to the war period.

Now we are facing identically the same thing today. If this emergency keeps up we are going to have to do something but the supplies are not available in West Virginia. Therefore we have investigated Kentucky.

There is a lot of shale gas down there and we have had our geologists down there.

Mr. Tollefson has been down there, and we have had other men down there, and there is not enough gas available in Kentucky at a reasonable price.

In other words, we figure it will cost us more to get it up from Kentucky than it will from Louisiana, so Mr. Tollefson has been many weeks in Louisiana investigating it with other geologists, and we have decided that, if this emergency keeps up the only thing to do is to go on through to Louisiana with the idea of later drawing on East Texas and Southern Louisiana for gas.

Q. At the present time the reserves in Louisiana are ample for— A. (Interposing) At the present time,

around in the Monroe field, they are ample for a few years, but eventually we would have to receive gas from East Texas and southern Louisiana, where the reserves are—well, they are as big as the ocean, I guess.

## COMPLAINT OF CITY OF CLEVELAND AGAINST HOPE NATURAL GAS COMPANY

Filed July 6, 1938—F. P. C. Docket No. G–100

1 The City of Cleveland brings this its complaint against Hope Natural Gas Company and for its cause of action avers:

First: Complainant, the City of Cleveland (hereinafter for convenience termed "Cleveland"), is a municipal corporation duly organized and existing under the laws and Constitution of the State of Ohio, and is a municipality within the meaning of the Natural Gas Act.

Second: Defendant, Hope Natural Gas Company (hereinafter for convenience designated as "Hope"), is a corporation duly organized and existing under the laws of the State of West Virginia, has its principal place of business in the City of Pittsburgh in the State of Pennsylvania, and is a natural gas company engaged in the transportation of natural gas in interstate commerce and the sale in interstate commerce of such gas for resale and is a public utility within the meaning of the Natural Gas Act.

2 Third: The only company distributing natural gas in Cleveland is The East Ohio Gas Company (hereinafter for convenience termed "East Ohio"), a wholly owned subsidiary of the Standard Oil Company (New Jersey), which purchases approximately 70 percent of the gas which it merchandises in Ohio from the defendant Hope, likewise a wholly owned subsidiary of the Standard Oil Company (New Jersey), said gas being produced in the State of West Virginia and delivered to East Ohio at the Ohio River.

Fourth: The price charged by defendant Hope to East Ohio for resale to consumers in Cleveland and elsewhere for all gas including domestic, commercial and regular industrial gas, and except only certain gas sold for resale to large industrial consumers under special contract, is 38½ cents per M. c. f. A copy of the Hope-East Ohio contract is filed herewith and made a part hereof as fully as though physically incorporated herein. Under said Hope-East Ohio contract, East Ohio pays to Hope annually a total of approximately $13,000,000.

Fifth: The price charged by defendant Hope to East Ohio for natural gas for resale to domestic, commercial and small indus-

trial consumers in Cleveland and elsewhere is excessive, unjust, unreasonable, greatly in excess of the price charged by Hope to nonaffiliated companies at wholesale for resale to domestic, commercial, and small industrial consumers, and greatly in excess of the price charged by Hope to East Ohio for resale to certain favored industrial consumers in Ohio, and therefore is further unduly discriminatory between customers and between classes of service.

Sixth: On May 20, 1937, the City of Cleveland passed a rate ordinance No. 106556, regulating and fixing the prices and terms upon which East Ohio shall furnish natural gas for and during the period from June 30, 1937 until July 1, 1939. East Ohio has appealed from said ordinance to The Public Utilities Commission of Ohio, and has suspended the ordinance rates by the filing of a bond to refund to its customers in Cleveland the excess collected in the interim over and above the ordinance rate or any other rate found to be fair by The Public Utilities Commission of Ohio. In this proceeding, now pending before The Public Utilities Commission of Ohio and known as Case No. 10202 on its docket, East Ohio seeks to include in operating expenses said price of 38½ cents per M. c. f. paid by it to its affiliate, the defendant Hope, at the rate fixed in said intercorporate contract between Hope and East Ohio for natural gas delivered at the Ohio River for transportation to and resale in Cleveland and elsewhere, commonly known as the River Rate.

A determination by this Honorable Commission of the fair, just, and reasonable rate for gas sold by Hope to East Ohio at the Ohio River should be of assistance in the cases of Cleveland and other Ohio municipalities now pending before The Public Utilities Commission of Ohio and is essential to the determination of a fair, just, and reasonable rate for natural gas in Cleveland after the expiration of the present ordinance approximately one year hence.

Seventh: The filing of this petition has been authorized and directed by resolution of the Council of the City of Cleveland adopted July 1, 1938.

Wherefore, Complainant prays for an investigation by the Federal Power Commission, a finding that said River Rate is excessive, unreasonable, and unjustly discriminatory, and for the fixing of a just, fair and reasonable rate.

## ANSWER OF HOPE NATURAL GAS COMPANY TO COMPLAINT OF THE CITY OF CLEVELAND

Filed August 18, 1938—F. P. C. Docket No. G-100

1 Hope Natural Gas Company, hereinafter called "Hope," for its answer to the petition herein filed—.

1. Admits the allegations contained in paragraph First of the petition.

2. Admits the allegations contained in paragraph Second of the petition.

3. Admits the allegations contained in paragraph Third of the petition.

4. Admits that the copies of its contracts with The East Ohio Gas Company, hereinafter called "East Ohio," filed with the petition, are true copies and begs leave to refer thereto for an exact statement of the price and the other terms and conditions of these contracts. Admits that under said contracts East Ohio paid to Hope for natural gas delivered thereunder during the year 1937 the sum of $12,757,670 for 35,074,416 M. c. f. of natural gas or an average price of 36.37¢ per M. c. f.

5. (a) Denies the allegations of paragraph Fifth of the petition in their entirety.

(b) As to the charge that the contract price between Hope and East Ohio for natural gas for resale to domestic, commercial and small industrial consumers is excessive and unreasonable, Hope avers that said price does and not has not in any recent
2 years been sufficient to yield more than a fair return on the fair value of its property devoted to that service; that this price since 1921 has been repeatedly investigated by the cities of Cleveland and Akron, Ohio, and by The Public Utilities Commission of Ohio, all of whom have made valuations of Hope's property, audited its operating expenses and otherwise investigated its property and operations, and that said price was recently approved by said Commission for the years 1933 to 1937 *In re East Ohio Gas Company*, 17 P. U. R. (N. S.) 433, and is now being reexamined by said Commission in the present controversy between East Ohio and the City of Cleveland arising out of the ordinance of May 20, 1937, referred to in the petition.

(c) As to the charge that this contract price to East Ohio is "greatly in excess of the price charged by Hope to nonaffiliated companies" and others and is therefore discriminatory, Hope avers that the differences in prices provided by its contracts with

East Ohio and with nonaffiliated companies arise solely out of differences in the terms and conditions of service; that Hope's contracts with nonaffiliated companies are expressly subordinated to the rights of the domestic consumers of East Ohio, among others, in the event of a shortage; that these contracts with nonaffiliated companies specify yearly, monthly and daily deliveries with limited variations therefrom and provide for deliveries principally at points in Hope's producing fields at low pressures, any further work of compression and transmission in West Virginia being performed by the purchasers. In the case of Hope's contract with East Ohio the requirements of the domestic consumers of that company are given preference over the consumers of all nonaffiliated purchasers; Hope's obligation is to deliver to East Ohio the requirements of the latter's domestic consumers in Ohio, whatever these requirements may be, and to deliver gas at the Ohio River at pressures sufficient to carry the gas to consumers' burner tips throughout the territory served by East Ohio. The latter company is not required to and does not maintain compressing stations for the transmission and distribution of this gas in Ohio. These substantial differences and others in the terms and conditions of service under Hope's contracts with East Ohio and with nonaffiliated companies are the basis for the differences in prices specified therein.

(d) As to the charge that this contract price is "greatly in excess of the price charged by Hope to East Ohio for resale to certain favored industrial consumers in Ohio" and is therefore unduly discriminatory, Hope avers that said industrial gas is not sold by East Ohio to favored consumers but under con-
3 tracts and schedules duly filed with and approved by The Public Utilities Commission of Ohio, such schedules being applicable to all consumers using the specified quantities and willing to accept service under the terms offered; that such gas is sold subject to interruption when necessary to furnish a full supply to other consumers and under a high load factor; that East Ohio receives for this gas as much as it can be sold for in competition with other fuels; that the sale of such gas by East Ohio and Hope at the prices received enables both companies to sell regular gas at lower prices than would otherwise be possible; that the discount thereon provided in said Hope-East Ohio contract is based on the special terms and conditions of service applicable to such gas, and is not unduly discriminatory.

6. (a) As to paragraph Sixth of the petition, Hope admits that on May 20, 1937, the City of Cleveland passed an ordinance as stated in the petition; admits that East Ohio has appealed from said ordinance to The Public Utilities Commission of Ohio; avers that the average rate previously in effect for domestic consumers in the City of Cleveland was substantially 57¢ per M. c. f., whereas the ordinance of May 20, 1937 fixes a rate that would average approximately 55½¢ per M. c. f.; avers that upon appealing to said Public Utilities Commission in accordance with the provisions of the Public Utilities Act of Ohio, East Ohio filed a bond to refund to consumers in Cleveland such part, if any, of the 1½¢ difference between said two rates as the Commission might subsequently find to be excessive; admits that in said proceeding now pending before The Public Utilities Commission of Ohio, East Ohio has included in operating expenses the sums paid by it to Hope for gas at the Ohio River at the present rate fixed in said contracts heretofore referred to.

(b) Hope denies that a determination by this Honorable Commission of the fair rate for gas sold by Hope to East Ohio at the Ohio River will be of any assistance in the case of the City of Cleveland now pending before The Public Utilities Commission of Ohio, averring that said Commission is required to determine the fairness of said contract price as of June 30, 1937, the effective date of said ordinance; that said Commission has had submitted to it and is checking and investigating complete inventories, valuations, operating expenses and other pertinent information relating to Hope; that such evidence has been submitted not only by East Ohio but much of it by the representatives of the City of Cleveland; and that both the representatives of the City of Cleveland and of The Public Utilities Com-
4 mission of Ohio have had access at all times to the books, records and property of Hope in so far as said Commission deemed pertinent. Hope respectfully suggests that while this Honorable Commission is given the power to determine interstate rates prospectively, it is not given the power to determine whether the rate in effect on June 30, 1937 was or was not unreasonable or unlawful.

(c) Hope denies that a determination of a fair contract price between East Ohio and Hope by this Honorable Commission is essential to the determination of a fair and reasonable rate for natural gas in Cleveland either now or after the expiration of the present ordinance in June, 1939. It averds that in repeated rate

controversies between the Cities of Cleveland and Akron and East Ohio since 1921 the Ohio courts or Public Utilities Commission hearing such controversy has in each instance imposed upon East Ohio the burden of proving that the prices at the time paid to Hope and reflected in its operating expenses were fair and reasonable prices; that in connection with the trial of said cases the engineers, accountants and attorneys of the respective cities have had access to the properties, books and records of Hope in so far as these were essential in determining Hope's costs; that the City of Cleveland had reports of its own engineers and accountants on Hope's properties and operations as of 1921, again as of 1928, again as of 1931 and again as of 1937, and additionally that the City of Akron had similar reports as of 1932. Because of the common ownership of the stock of Hope and East Ohio The Public Utilities Commission of Ohio, the City of Cleveland and East Ohio have all assented to the position in the present controversy pending before said Commission that the contract price between the two affiliated companies at the river is not even prima facie evidence of its fairness and both parties introduced evidence as to, and the Commission itself is investigating, the value of the properties of Hope, its operations and its operating expenses in as complete detail as for East Ohio. Moreover, the Commission in former cases involving East Ohio rates has allowed as an operating expense to East Ohio the sums paid to Hope on account of gas delivered at the Ohio River only to the extent that it found them to be fair and reasonable. In the present Cleveland case the matter is being submitted to the Commission by all parties on the assumption that the Commission will again decide and allow in East Ohio's operating expenses whatever it finds to be the fair and reasonable river rate as of June 30, 1937, not exceeding, however, the price actually paid. In view of the facts hereinabove stated Hope
5 avers that the properties, records, and operations of East Ohio and Hope, and their relations, have been under almost continuous investigation by the Cities of Cleveland and Akron for the past ten years and by The Public Utilities Commission of Ohio for the past seven years and denies that the exercise by this Commission of its jurisdiction as sought in the petition is necessary to enable either the City of Cleveland or said Commission to fix a fair rate for natural gas service in Cleveland or elsewhere.

7. Admits the allegations contained in paragraph Seventh of the petition.

## COMPLAINT OF THE CITY OF AKRON AGAINST HOPE NATURAL GAS COMPANY

Filed July 25, 1938—F. P. C. Docket No. G-101

1 The city of Akron, Ohio, brings this its complaint against Hope Natural Gas Company and for its cause of action avers:

First: Complainant, the City of Akron (hereafter for convenience termed "Akron"), is a municipal corporation duly organized and existing under the laws and Constitution of the State of Ohio, and is a municipality within the meaning of the Natural Gas Act.

Second: Defendant, Hope Natural Gas Company (hereinafter for convenience designated as "Hope"), is a corporation duly organized and existing under the laws of the State of West Virginia, has its principal place of business in the City of Pittsburgh in the State of Pennsylvania, and is a natural gas company engaged in the transportation of natural gas in interstate commerce and the sale in interstate commerce of such gas for resale and is a public utility within the meaning of the Natural Gas Act.

Third: The only company distributing natural gas in Akron is The East Ohio Gas Company (hereinafter for convenience termed "East Ohio"), a wholly owned subsidiary of the Standard Oil Company (New Jersey), which purchases approximately 70 per cent of the gas which it merchandises in Ohio from the
2 defendant Hope, likewise a wholly owned subsidiary of the Standard Oil Company (New Jersey), said gas being produced in the State of West Virginia and delivered to East Ohio at the Ohio River.

Fourth: The price charged by defendant Hope to East Ohio for resale to consumers in Akron and elsewhere for all gas including domestic, commercial and regular industrial gas, and except only certain gas sold for resale to large industrial consumers under special contract, is 38½ cents per M. c. f. A copy of the Hope-East Ohio contract is filed herewith and made a part hereof as fully as though physically incorporated herein. Under said Hope-East Ohio contract, East Ohio pays to Hope annually a total of approximately $13,000,000.

Fifth: The price charged by defendant Hope to East Ohio for natural gas for resale to domestic, commercial and small industrial consumers in Akron and elsewhere is excessive, un-

just, unreasonable, greatly in excess of the price charged by Hope to nonaffiliated companies at wholesale for resale to domestic, commercial, and small industrial consumers, and greatly in excess of the price charged by Hope to East Ohio for resale to certain favored industrial consumers in Ohio, and therefore is further unduly discriminatory between customers and between classes of service.

Sixth: On May 11, 1937, the City of Akron passed a rate ordinance, No. 136–1937, regulating and fixing the prices and terms upon which East Ohio shall furnish natural gas for
3 and during the period from June 10, 1937 until July 10, 1941.

East Ohio has appealed from said ordinance to The Public Utilities Commission of Ohio, and has suspended the ordinance rates by the filing of a bond to refund to its customers in Akron the excess collected in the interim over and above the ordinance rate or any other rate found to be fair by The Public Utilities Commission of Ohio. In this proceeding, now pending before The Public Utilities Commission of Ohio and known as Case No. 10162 on its docket, East Ohio seeks to include in operating expenses said price of 38½ cents per M. c. f. paid by it to its affiliate, the defendant Hope, at the rate fixed in said intercorporate contract between Hope and East Ohio for natural gas delivered at the Ohio River for transportation to and resale in Akron and elsewhere, commonly known as the River Rate.

A determination by this Honorable Commission of the fair, just, and reasonable rate for gas sold by Hope to East Ohio at the Ohio River should be of assistance in the cases of Akron and other Ohio municipalities now pending before The Public Utilities Commission of Ohio and is essential to the determination of a fair, just, and reasonable rate for natural gas in Akron after the expiration of the present ordinance.

Seventh: The filing of this petition has been authorized and directed by resolution of the Council of the City of Akron adopted July 5, 1938.

Wherefore, Complainant prays for an investigation by
4 the Federal Power Commission, a finding that said River Rate is excessive, unreasonable, and unjustly discriminatory, and for the fixing of a just, fair, and reasonable rate.

## ANSWER OF HOPE NATURAL GAS COMPANY TO COMPLAINT OF THE CITY OF AKRON

Filed August 26, 1938—F. P. C. Docket No. G-101

1 Hope Natural Gas Company, hereinafter called "Hope," for its answer to the petition herein filed—

1. Admits the allegations contained in paragraph First of the petition.

2. Admits the allegations contained in paragraph Second of the petition.

3. Admits the allegations contained in paragraph Third of the petition.

4. Admits that the copies of its contracts with The East Ohio Gas Company, hereinafter called "East Ohio," filed with the petition, are true copies and begs leave to refer thereto for an exact statement of the price and the other terms and conditions of these contracts. Admits that under said contracts East Ohio paid to Hope for natural gas delivered thereunder during the year 1937 the sum of $12,757,670 for 35,074,416 M. c. f. of natural gas or an average price of 36.37¢ per M. c. f.

5. (a) Denies the allegations of paragraph Fifth of the petition in their entirety.

(b) As to the charge that the contract price between Hope and East Ohio for natural gas for resale to domestic, commercial, and small industrial consumers is excessive and unreasonable, Hope avers that said price does not and has not in any recent years

2 been sufficient to yield more than a fair return on the fair value of its property devoted to that service; that this price since 1921 has been repeatedly investigated by the cities of Cleveland and Akron, Ohio, and by The Public Utilities Commission of Ohio, all of whom have made valuations of Hope's property, audited its operating expenses and otherwise investigated its property and operations, and that said price was recently approved by said Commission as more particularly set forth in paragraph 6 (a) hereof, and is now being reexamined by said Commission in the present controversy between East Ohio and the City of Akron arising out of the ordinance of May 11, 1937, referred to in the petition and upon East Ohio's appeal to said Commission from an ordinance of the City of Cleveland passed May 20, 1937, prescribing East Ohio's rates in Cleveland for a period of two years from June 30, 1937. Said Cleveland ordinance and said

proceeding thereon before said Commission are fully described in the petition and answer of the parties in *City of Cleveland* vs. *Hope Natural Gas Company*, No. G-100 before this Honorable Commission. Hope begs leave to refer to said petition and answer for a more complete statement of said Cleveland ordinance and said proceeding.

(c) As to the charge that this contract price to East Ohio is "greatly in excess of the price charged by Hope to nonaffiliated companies" and others and is therefore discriminatory, Hope avers that the differences in prices provided by its contracts with East Ohio and with nonaffiliated companies arise solely out of differences in the terms and conditions of service; that Hope's contracts with nonaffiliated companies are expressly subordinated to the rights of the domestic consumers of East Ohio, among others, in the event of a shortage; that these contracts with nonaffiliated companies specify yearly, monthly, and daily deliveries with limited variations therefrom and provide for deliveries principally at points in Hope's producing fields at low pressures, any further work of compression and transmission in West Virginia being performed by the purchasers. In the case of Hope's contract with East Ohio the requirements of the domestic consumers of that company are given preference over the consumers of all nonaffiliated purchasers; Hope's obligation is to deliver to East Ohio the requirements of the latter's domestic consumers in Ohio, whatever these requirements may be, and to deliver gas at the Ohio River at pressures sufficient to carry the gas to consumers' burner tips throughout the territory served by East Ohio. The latter
3 company is not required to and does not maintain compressing stations for the transmission and distribution of this gas in Ohio. These substantial differences and others in the terms and conditions of service under Hope's contracts with East Ohio and with nonaffiliated companies are the basis for the differences in prices specified therein.

(d) As to the charge that this contract price is "greatly in excess of the price charged by Hope to East Ohio for resale to certain favored industrial consumers in Ohio" and is therefore unduly discriminatory, Hope avers that said industrial gas is not sold by East Ohio to favored consumers but under contracts and schedules duly filed with and approved by The Public Utilities Commission of Ohio, such schedules being applicable to all consumers using the specified quantities and willing to accept service under the terms offered; that such gas is sold subject to interruption when neces-

sary to furnish a full supply to other consumers and under a high load factor; that East Ohio receives for this gas as much as it can be sold for in competition with other fuels; that the sale of such gas by East Ohio and Hope at the prices received enables both companies to sell regular gas at lower prices than would otherwise be possible; that the discount thereon provided in said Hope-East Ohio contract is based on the special terms and conditions of service applicable to such gas, and is not unduly discriminatory.

6. (a) As to paragraph Sixth of the petition Hope avers that prior to May 19, 1932, East Ohio was collecting in the City of Akron, pursuant to an ordinance contract between East Ohio and Akron, a domestic rate averaging a little more than 64¢ per M. c. f. Effective May 19, 1933, the electors of the City of Akron enacted an initiated ordinance for a four-year period ending May 19, 1937, which provided a domestic rate averaging about 50¢ per M. c. f.

East Ohio appealed to The Public Utilities Commission of Ohio from this latter ordinance and in accordance with the statutes of Ohio elected to collect under bond the rate theretofore in effect. The City of Akron employed the same engineers, accountants and geologists who had theretofore and have since represented the City of Cleveland in rate controversies with East Ohio and presented to the Commission, as did East Ohio, complete testimony as to the value of Hope's property, its operating expenses and its operations. For this purpose they were given access to Hope's properties, books, and records insofar as these bore on Hope's costs of gas.

4 On February 1, 1937, said Commission made its findings and order and thereby found the rate fixed by said ordinance effective May 19, 1933, to be unjust and unreasonable and fixed a rate to be substituted therefor averaging 62.35¢ per M.c.f.

In its findings said Commission valued the property of Hope and determined its operating expenses in precisely the same detail as it did for East Ohio. It further found that he contract price of 38½¢ paid by East Ohio to Hope and here under attack, was a fair and reasonable price and allowed the same in the amount paid by East Ohio as a part of its operating expenses. The findings and order of said Commission are published in *Re East Ohio Gas Company*, 17 P. U. R. (N. S.) 433, and Hope begs leave to refer to the extensive and detailed findings there made insofar as here material.

Both East Ohio and the City of Akron prosecuted error from said findings and final order of the Commission to the Supreme Court of Ohio which affirmed said order of the Commission setting aside said 1933 ordinance rate as unreasonable and unlawful, but reversed said order and finding fixing a new rate and directed said Commission to modify the same in certain minor respects, the effect of which Hope avers will be to increase the rate to be finally fixed by said Commission. For a more complete statement Hope begs leave to refer to the report of said case, *East Ohio Gas* . v. *Public Utilities Commission*, 133 O. S. 212.

Notwithstanding that said Public Utilities Commission had theretofore held said 1933 Akron ordinance rate to be grossly unreasonable, the City of Akron proceeded, as alleged in its petition, on May 11, 1937, to pass a new ordinance effective for another four-year period, fixing precisely the same rate as that stricken down. East Ohio has likewise appealed from said last ordinance, elected to continue the former rate under bond and said appeal is now pending before the Public Utilities Commission of Ohio. Hope admits that East Ohio will include in operating expense and ask the Commission to allow the sums paid to Hope for the purchase of gas at the Ohio River under the Hope-East Ohio contract.

(b) Hope denies that a determination by this Honorable Commission of the fair rate for gas sold by Hope to East Ohio at the Ohio River will be of any assistance in the case of the City of Akron now pending before The Public Utilities Commission of Ohio, averring that said Commission is required to determine the fairness of said contract price as of approximately June 10, 1937, the effective date of said ordinance. Hope respectfully suggests that while this Honorable Commission is given the power to determine interstate rates prospectively, it is not given the power to determine whether the rate in effect on or about June 10, 1937 was or was not unreasonable or unlawful.

(c) Hope denies that a determination of a fair contract price between East Ohio and Hope by this Honorable Commission is essential to the determination of a fair and reasonable rate for natural gas in Akron either now or after the expiration of the present ordinance in June 1941. It avers that in repeated rate controversies between the Cities of Cleveland and Akron and East Ohio since 1921 the Ohio court or Public Utilities Commission hearing such controversy has in each instance imposed upon East Ohio the burden of proving that the prices at the time

paid to Hope and reflected in its operating expenses were fair and reasonable prices; that in connection with the trial of said cases the engineers, accountants and attorneys of the respective cities have had access to the properties, books, and records of Hope inofar as these were esential in determining Hope' costs; that the City of Cleveland had reports of its own engineers and accountants on Hope's properties and operations as of 1921, again as of 1928, again as of 1931, and again as of 1937, and that the City of Akron had access to the Cleveland reports and additionally had similar reports as of 1932. Because of the common ownership of the stock of Hope and East Ohio, The Public Utilities Commission of Ohio, the Cities of Cleveland and Akron and East Ohio have all assented to the position in rate controversies that the contract price between the two affiliated companies at the river is not even prima facie evidence of its fairness. All parties have introduced evidence as to, and the Commission itself has investigated, the value of the properties of Hope, its operations and its operating expenses in as complete detail as for East Ohio. Moreover, the Commission in former cases involving East Ohio rates has allowed as an operating expense to East Ohio the sums paid to Hope on account of gas delivered at the Ohio River only to the extent that it found them to be fair and reasonable. In view of the facts hereinabove stated Hope avers that the properties, records, and operations of East Ohio and Hope, and their relations, have been under almost continuous investigation by the Cities of Cleveland and Akron for the past ten years and by
6 The Public Utilities Commission of Ohio for the past seven years and denies that the exercise by this Commission of its jurisdiction as sought in the petition is necessary to enable either the City of Akron or said Commission to fix a fair rate for natural gas service in Akron or elsewhere.

7. Admits the allegations contained in paragraph Seventh of the petition.

## AMENDMENT TO COMPLAINT OF THE CITY OF CLEVELAND AGAINST HOPE NATURAL GAS COMPANY

Filed January 6, 1939—F. P. C. Docket No. G–100

1 The City of Cleveland, with leave of the Federal Power Commission first obtained, amends its petition and complaint herein by the addition of the following allegations, averments, and prayer:

First: Pursuant to the Natural Gas Act, Public No. 688, 75th Congress, Chapter 556, Third Session, approved June 21, 1938, and effective June 21, 1938, your Honorable Commission has authority to investigate any facts, conditions, practices, or matters which it may find necessary or proper in order to determine whether any person has violated or is about to violate any provision of said Natural Gas Act. (Sec. 14 (a).)

Second: Pursuant to said Natural Gas Act, your Honorable Commission has authority to make available to state commissions and municipalities, information concerning any such matter. (Sec. 14 (a).)

Third: Pursuant to said Natural Gas Act, all rates and charges, made, demanded or received by any natural gas company for or in connection with the transportation or sale of natural gas subject to the jurisdiction of the Commission must be just and reasonable and nondiscriminatory and any such rate or
2 charge that is not just and reasonable and nondiscriminatory is unlawful, and has been unlawful ever since the effective date of said Natural Gas Act on June 21, 1938. (Sec. 4 (a) and (b).)

Fourth: Pursuant to said Natural Gas Act, your Honorable Commission has authority to investigate and determine whether the charges made by Hope Natural Gas Company and payments received from The East Ohio Gas Company were unjust, unreasonable, unduly discriminatory and preferential and therefore contrary to Federal law, as of June 21, 1938, the effective date of the Natural Gas Act, and at all times subsequent thereto. (Natural Gas Act, Sec. 14 (a), (b).) (Sec. 4 (a).)

Fifth: Pursuant to said Natural Gas Act, your Honorable Commission upon its own motion, or upon the request of any state commission, whenever it can do so without prejudice to the efficient and proper conduct of its affairs, may investigate and determine the cost of the production and transportation of natural gas by a natural gas company in cases where the Commission has

no authority to establish a rate governing the transportation or sale of such natural gas. (Natural Gas Act, Sec. 5 (b).)

Sixth: The price charged by defendant Hope to East Ohio for natural gas was on June 21, 1938, and has been at all times since excessive, unjust, unreasonable, and discriminatory, at least in so far as said price has exceeded an average of 30 cents per M. c. f., and therefore was as of June 21, 1938, and has been at all times since, unlawful and contrary to the laws of the United States.

Seventh: A determination by your Honorable Commission in accordance with the prayer of this amendment should be of assistance in the cases of Cleveland and other Ohio municipalities now pending before The Public Utilities Commission of Ohio, in that the reasonableness of the ordinance rate in Cleveland for the two year period ending on or about June 30, 1939, is ultimately dependent upon the lawfulness of the charge made by Hope Natural Gas Company to The East Ohio Gas Company at the Ohio River; and the only body which can determine whether the price charged by Hope to East Ohio and received by Hope from East Ohio has been unlawful and contrary to the laws of the United States is your Honorable Commission (Natural
3 Gas Act, Sec. 1 (b)); and in the case of The East Ohio Gas Company v. Cleveland, now pending before The Public Utilities Commission of Ohio and known as Case No. 10202 on the docket of said commission, no allowance can be made in the operating expenses of The East Ohio Gas Company which is unlawful either for the buyer to pay, or for the seller to charge or receive.

Wherefore, the City of Cleveland prays that the order of investigation of the Federal Power Commission dated October 14, 1938, and docketed as No. G–113, be modified to include an investigation whether Hope Natural Gas Company has violated the Natural Gas Act by charging to and receiving from The East Ohio Gas Company an unreasonable, unjust, and discriminatory rate for natural gas delivered at the Ohio River on and since June 21, 1938, at least in so far as the average charge made by Hope Natural Gas Company and payment received from The East Ohio Gas Company has exceeded 30 cents per M. c. f.; further prays for a determination that the Natural Gas Act has been so violated by defendant Hope ever since June 21, 1938; and further prays that the information concerning such matter be made available to The Public Utilities Commission of Ohio and to the City of Cleveland.

## ANSWER OF HOPE NATURAL GAS COMPANY TO AMENDMENT TO COMPLAINT OF THE CITY OF CLEVELAND

Filed February 6, 1939—F. P. C. Docket No. G-100

1 Hope Natural Gas Company, hereinafter called "Hope," for its answer to the "Amendment to Petition and Complaint" filed herein by the City of Cleveland—

1. Admits that the Natural Gas Act was approved and became effective as set forth in paragraph First of said amendment and that said Act contains Sections 1 (b), 4 (a) and (b), 5 (b) and 14 (a) and (b) as set forth in paragraphs First, Second, Third, Fourth, Fifth and Seventh of said amendment, but denies that the statements of the terms and provisions of said Act and said sections thereof as set forth in said paragraphs are either accurate, correct or complete and refers to said Act and said sections thereof for an accurate, correct and complete statement of the law attempted to be summarized in said amendment.

2. (a) Denies the allegations of paragraph Sixth of said amendment in their entirety.

(b) As to the claim that the contract price charged for natural gas by Hope to The East Ohio Gas Company, hereinafter called "East Ohio," was on June 21, 1938 and at all times thereafter excessive, unjust, unreasonable and discriminatory, Hope avers that said price at said times did not and has not in any
2 recent years been sufficient to yield more than a fair return on the fair value of its properties devoted to that service; that since 1921 the price between Hope and East Ohio has repeatedly been investigated by the cities of Cleveland and Akron, Ohio, and by The Public Utilities Commission of Ohio, all of whom have made valuations of Hope's properties, audited its operating expenses and otherwise investigated its properties and operations; that said price was recently approved by said Commission for the years 1933 to 1937 *In re East Ohio Gas Company*, 17 P. U. R. (N. S.) 433; and that after further exhaustive hearings and a comprehensive investigation, including determinations of the value of Hope's properties as of June 30, 1937 and June 30, 1938, analyses of its operations, the ascertainment of its reasonable operating expenses and the fixing of a fair rate of return, said Commission on January 10, 1939 in the case of East Ohio's appeal from the City of Cleveland ordinance referred to in paragraph Seventh of said amendment, known as Cause No. 10,202 on the

docket of said Commission, found that said Hope-East Ohio price, as existing on June 21, 1938 and at all times since, was fair and reasonable and should properly be allowed in the operating expenses of East Ohio for the two-year period of said City of Cleveland ordinance ending June 30, 1939. The conclusion of said Commission hereon is set forth in its order of January 10, 1939 in said Cause No. 10,202, based on its findings and opinion of such date, as follow:

"That the fair and reasonable price to be paid by the East Ohio Ohio Gas Company to The Hope Natural Gas Company for gas supplied and furnished for distribution in the said City of Cleveland, Ohio, is the price of 38.5¢ per one thousand cubic feet, provided by the contract now existing by and between the said Companies, adjusted as provided in said contract for special industrial sales to average 36.15¢ and 36.82¢ per one thousand cubic feet for the years ended June 30, 1937, and June 30, 1938, respectively;".

3. (a) Denies the allegations of paragraph Seventh of said amendment in their entirety.

(b) As to the claim that a determination by this Honorable Commission in accordance with the prayer of said amendment will be of assistance in the case of the City of Cleveland pending before said Public Utilities Commission of Ohio, Hope avers that since the filing of said amendment said Commission on January 10, 1939 rendered its final decision and order in said case,

3 Cause No. 10,202, referred to in paragraph Seventh of said amendment and in the preceding paragraph 2 (b) of this answer. The inquiry and determination requested by the prayer of said amendment will be of no assistance to either the City of Cleveland or said Public Utilities Commission of Ohio in connection with said Cause No. 10,202.

## COMPLAINT OF PENNSYLVANIA PUBLIC UTILITY COMMISSION AGAINST HOPE NATURAL GAS COMPANY

Filed March 23, 1939—F. P. C. Docket No. G-127

1 Pennsylvania Public Utility Commission, complaining of the Hope Natural Gas Company, respectfully alleges for a first ground of complaint:

1. Pennsylvania Public Utility Commission, the Complainant here, is the regulatory body having jurisdiction to regulate rates and charges for the sale of natural gas to consumers within the Commonwealth of Pennsylvania, by virtue of Act No. 43, Pennsylvania Laws, 1937, and Act No. 286, Pennsylvania Laws, 1937 (as amended by Act No. 19, Extraordinary Session, Pennsylvania Laws, 1938), and is a "State Commission", within the meaning of Section II (8) of the Natural Gas Act.

2 2. The Defendant, Hope Natural Gas Company, is a corporation duly organized and existing under the laws of the State of West Virginia. Its principal office is located at 545 William Penn Way, Pittsburgh, in the Commonwealth of Pennsylvania, and it is a wholly owned subsidiary of the Standard Oil Company (New Jersey). Hope Natural Gas Company is engaged in the business of transporting and selling natural gas in interstate commerce, for resale, and is a "natural gas company" within the meaning of Section II (6) of the Natural Gas Act.

3. The Peoples Natural Gas Company is a corporation organized and existing under the laws of the Commonwealth of Pennsylvania, with its principal office at 545 William Penn Way, Pittsburgh, Pa. The Peoples Natural Gas Company is also a wholly owned subsidiary of the Standard Oil Company (New Jersey), and supplies gas at retail to approximately 124,000 consumers, in 12 counties in the Commonwealth of Pennsylvania.

4. Your Complainant, under its Complaint Docket No. 11380, Sub. No. 20, is conducting an inquiry and investigation for the purpose of determining the fairness and reasonableness of the rates and charges of The Peoples Natural Gas Company. According to its annual report for the year 1937 (the last available), The Peoples Natural Gas Company, under a contract effective May 8, 1937, purchased from Hope Natural Gas Company,

3 for resale to consumers in Pennsylvania, 3,506,013,000 cubic feet of natural gas, at a cost of $1,349,815.05. The price charged by Defendant, Hope Natural Gas Company, to The

Peoples Natural Gas Company was, and is at the present time, 38½c per thousand cubic feet, delivered to the Pennsylvania-West Virginia state line.

5. The sum paid by The Peoples Natural Gas Company to Defendant, Hope Natural Gas Company, in the year 1937, constituted approximately 17% of the total operating expenses of The Peoples Natural Gas Company for that year. The price charged by Defendant, Hope Natural Gas Company, to The Peoples Natural Gas Company for natural gas resold to consumers in Pennsylvania therefore directly affects the resale price to such consumers. In the proceeding instituted by the Pennsylvania Public Utility Commission against The Peoples Natural Gas Company, at Complaint Docket No. 11380, Sub. No. 20, referred to above, The Peoples Natural Gas Company seeks to include in its operating expenses the cost of natural gas purchased from the Defendant, Hope Natural Gas Company, at the price of 38½¢ per thousand cubic feet. A determination of the fair and reasonable rate at which gas should be sold by Hope Natural Gas Company to The Peoples Natural Gas Company is essential to a determination of the reasonableness of the rates charged by The Peoples Natural Gas Company to consumers in Pennsylvania.

6. On information and belief, it is alleged that the price of 38½¢ per thousand cubic feet charged by the Defendant, Hope Natural Gas Company is unlawful, excessive, unreasonable
4 and discriminatory in that:

(a) The sum charged The Peoples Natural Gas Company exceeds the reasonable cost of producing and transporting the gas, as described above, plus a reasonable and lawful return on the property invested for purposes of such production, transportation and sale;

(b) The sum charged The Peoples Natural Gas Company exceeds the price charged by Defendant to other companies operating in Pennsylvania, in territories similar to that of The Peoples Natural Gas Company, and under similar conditions of use and service, where such other operating companies are not affiliated with the Defendant or the Standard Oil Company (New Jersey).

7. All the natural gas sold by Defendant, Hope Natural Gas Company, to The Peoples Natural Gas Company is produced in West Virginia or states other than Pennsylvania, and transported directly in interstate commerce to the facilities of The Peoples

Natural Gas Company at the Pennsylvania-West Virginia state line. Your Honorable Commission is the only body which can determine whether the price charged by Hope Natural Gas Company to The Peoples Natural Gas Company for the natural gas so transported is just and reasonable, and whether the charge thus made was and is unlawful and contrary to the laws of the United States, as set forth in the Natural Gas Act, Section IV (a).

5 8. The Pennsylvania Public Utility Commission, Complainant, has available records relating to the production, transportation and sale of natural gas in Pennsylvania, and has also available a staff of accountants, engineers and other experts, all of which the Complainant hereby tenders and offers to the Federal Power Commission, for use in accordance with Section 17 (b) of the Natural Gas Act.

9. The filing of this petition has been authorized by a resolution adopted at the Executive Session of the Commission on January 16, 1939.

Wherefore, your Complainant prays that your Honorable Commission:

(a) Investigate the price charged by Defendant, Hope Natural Gas Company, to The Peoples Natural Gas Company for natural gas sold by the latter to the former, at the Pennsylvania-West Virginia state line, and fix the just, fair, and reasonable rate for the same.

(b) Make a determination that the Hope Natural Gas Company has, since June 21, 1938, violated the Natural Gas Act, Section IV (a).

(c) Make available to the Complainant, the Pennsylvania Public Utility Commission, the facts, records, and other relevant matters which your Honorable Commission may acquire in this proceeding.

6 Pennsylvania Public Utility Commission, complaining of the Hope Natural Gas Company, respectfully alleges for a second ground of complaint:

1. The allegations contained in paragraphs 1, 2, 8, and 9 of the first ground of complaint are hereby made a part of the second ground of complaint as fully as though the same were repeated.

2. Fayette County Gas Company is a corporation organized and existing under the laws of the Commonwealth of Pennsylvania, with its principal office at 800 Union Trust Building, Pittsburgh, Pennsylvania. The Fayette County Gas Company supplies gas at

retail to approximately 16,000 consumers in Fayette and Westmoreland Counties in the Commonwealth of Pennsylvania.

3. Your Complainant, under its Complaint Docket No. 11380, Sub. No. 97, is conducting an inquiry and investigation for the purpose of determining the fairness and reasonableness of the rates and charges of Fayette County Gas Company. According to its annual report for the year 1937 (the last available) Fayette County Gas Company purchased from Hope Natural Gas Company for resale to consumers in Pennsylvania, 849,305,000 cubic feet of natural gas at a cost of $267,536.10. The price charged by Defendant, Hope Natural Gas Company, to Fayette County Gas Company, was and is at the present time 31½¢ per thousand cubic feet, delivered at the Pennsylvania-West Virginia state line.

4. The sum paid by Fayette County Gas Company to Defendant, Hope Natural Gas Company, in the year 1937, constituted approximately 35% of the total operating expenses of Fayette County Gas Company for that year. The price charged by Defendant, Hope Natural Gas Company, to Fayette County Gas Company, for natural gas resold to consumers in Pennsylvania, therefore, directly affects the resale price to such consumers. In the proceeding instituted by the Pennsylvania Public Utility Commission against Fayette County Gas Company at Complaint Docket No. 11380, Sub. No. 97, referred to above, the Fayette County Gas Company seeks to include in its operating expenses the cost of natural gas purchased from the Defendant, Hope Natural Gas Company, at the price of 31½¢ per thousand cubic feet. A determination of the fair and reasonable rate at which gas should be sold by Hope Natural Gas Company to Fayette County Gas Company is essential to a determination of the reasonableness of the rates charged by Fayette County Gas Company, to consumers in Pennsylvania.

5. On information and belief it is alleged that the price of 31½¢ per thousand cubic feet charged by the Defendant, Hope Natural Gas Company is unlawful, excessive, and unreasonable, in that the sum charged the Fayette County Gas Company exceeds the reasonable cost of producing and transporting the gas, as described above, plus a reasonable and lawful return on the property invested for purposes of such production, transportation and sale.

6. All the natural gas sold by Defendant, Hope Natural Gas Company, to Fayette County Gas Company is produced in West

Virginia or states other than Pennsylvania, and transported directly in interstate commerce to the facilities of Fayette
8 County Gas Company at the Pennsylvania-West Virginia state line. Your Honorable Commission is the only body which can determine whether the price charged by Hope Natural Gas Company to Fayette County Gas Company for the natural gas so transported is just and reasonable, and whether the charge thus made was and is unlawful and contrary to the laws of the United States, as set forth in the Natural Gas Act, Section IV (a).

Wherefore, your Complainant prays that your Honorable Commission:

(a) Investigate the price charged by Defendant, Hope Natural Gas Company, to Fayette County Gas Company for natural gas sold by the latter to the former, at the Pennsylvania-West Virginia state line, and fix the just, fair, and reasonable rate for the same.

(b) Make a determination that the Hope Natural Gas Company has, since June 21, 1938, violated the Natural Gas Act, Section IV (a).

(c) Make available to the Complainant, the Pennsylvania Public Utility Commission, the facts, records, and other relevant matters which your Honorable Commission may acquire in this proceeding.

9 Pennsylvania Public Utility Commission, complaining of the Hope Natural Gas Company, respectfully alleges for a third ground of complaint:

1. The allegations contained in paragraphs 1, 2, 8, and 9 of the first ground of complaint are hereby made a part of the third ground of complaint as fully as though the same were repeated.

2. The Manufacturers Light and Heat Company is a corporation, organized and existing under the laws of the Commonwealth of Pennsylvania, with its principal office at 800 Union Trust Building, Pittsburgh, Pennsylvania, and supplies gas at retail to approximately 113,000 consumers in the Commonwealth of Pennsylvania.

3. Your Complainant, under its Complaint Docket No. 11380, Sub. No. 18, is conducting an inquiry and investigation for the purpose of determining the fairness and reasonableness of the rates and charges of The Manufacturers Light and Heat Company. According to its annual report for the year 1937 (the last available) The Manufacturers Light and Heat Company purchased from Hope Natural Gas Company for resale to consumers in Pennsylvania 7,444,905,000 cubic feet of natural gas at a cost of $2,345,-

145.11. The price charged by Defendant, Hope Natural Gas Company, to The Manufacturers Light and Heat Company was, and is at the present time 31½¢ per thousand cubic feet, delivered at the Pennsylvania-West Virginia state line.

10 4. The sum paid by The Manufacturers Light and Heat Company to Defendant, Hope Natural Gas Company, in the year 1937, constituted approximately 23½% of the total operating expenses of The Manufacturers Light and Heat Company for that year. The price charged by Defendant, Hope Natural Gas Company, to The Manufacturers Light and Heat Company for natural gas resold to consumers in Pennsylvania, therefore, directly affects the resale price to such consumers. In the proceeding instituted by the Pennsylvania Public Utility Commission against The Manufacturers Light and Heat Company, at Complaint Docket No. 11380, Sub. No. 18, referred to above, The Manufacturers Light and Heat Company seeks to include in its operating expenses the cost of natural gas purchased from the Defendant, Hope Natural Gas Company, at the price of 33½¢ per thousand cubic feet. A determination of the fair and reasonable rate at which gas should be sold by Hope Natural Gas Company to The Manufacturers Light and Heat Company, is essential to a determination of the reasonableness of the rates charged by The Manufacturers Light and Heat Company to consumers in Pennsylvania.

5. On information and belief it is alleged that the price of 31½¢ per thousand cubic feet charged by the Defendant, Hope Natural Gas Company is unlawful, excessive, and unreasonable, in that the sum charged The Manufacturers Light and Heat Company exceeds the reasonable cost of producing and transporting the gas, as described above, plus a reasonable and lawful return on the property invested for purposes of such production, transportation, and sale.

11 6. All natural gas sold by Defendant, Hope Natural Gas Company, to The Manufacturers Light and Heat Company, is produced in West Virginia or states other than Pennsylvania, and transported directly in interstate commerce to the facilities of The Manufacturers Light and Heat Company at the Pennsylvania-West Virginia state line. Your Honorable Commission is the only body which can determine whether the price charged by Hope Natural Gas Company to The Manufacturers Light and Heat Company for the natural gas so transported is just and reasonable, and whether the charge thus made was and is unlawful

and contrary to the laws of the United States, as set forth in the Natural Gas Act, Section IV (a).

Wherefore, your Complainant prays that your Honorable Commission:

(a) Investigate the price charged by Defendant, Hope Natural Gas Co...pany, to The Manufacturers Light and Heat Company for natural gas sold by the latter to the former, at the Pennsylvania-West Virginia state line, and fix the just, fair, and reasonable rate for the same.

(b) Make a determination that the Hope Natural Gas Company has, since June 21, 1938, violated the Natural Gas Act, Section IV (a).

(c) Make available to the Complainant, the Pennsylvania Public Utility Commission, the facts, records, and other relevant matters which your Honorable Commission may acquire in this proceeding.

## ANSWER OF HOPE NATURAL GAS COMPANY TO COMPLAINT OF THE PENNSYLVANIA PUBLIC UTILITY COMMISSION

Filed April 25, 1939—F. P. C. Docket No. G–127

1 Defendant, Hope Natural Gas Company, for its answer to the several grounds of complaint set forth in the petition says:

As To The First Ground of Complaint

1. The defendant admits the allegations contained in paragraphs 1 and 2 thereof except the allegation that it is engaged in the business of transporting natural gas in interstate commerce, which it denies.

2. The defendant admits the allegations contained in paragraphs 3 and 4 thereof except it avers that the price of 38½¢ per thousand cubic feet for natural gas specified in the contract between the defendant and The Peoples Natural Gas Company contemplates that the defendant shall deliver gas sold to the Peoples Company at sufficient pressure to carry the gas to consumers' meters of the Peoples Company in its principal marketing area and provides that during the time that it is unable to do this and the Peoples Company finds it necessary to maintain a compressor station at or near the points of delivery, the Peoples Company shall be allowed the sum of 3¢ per thousand cubic feet in reduction of the purchase price. The defendant avers
2 that for some years past The Peoples Natural Gas Company has so maintained a compressor station, and that in settlements between it and the defendant for the gas sold the Peoples Company has been credited with 3¢ per thousand cubic feet against said purchase price of 38½¢.

3. As to paragraph 5 the defendant is without accurate knowledge of the matters therein alleged and for want thereof denies the same.

4. The defendant denies each and several the allegations contained in paragraph 6.

5. The defendant admits the allegations contained in paragraph 7 except the allegations that the natural gas sold by defendant to The Peoples Natural Gas Company is "transported directly in interstate commerce" and that the price charged by defendant to The Peoples Natural Gas Company is for the transportation of natural gas, which it denies.

6. As to paragraphs 8 and 9 the defendant is without knowledge of the matters therein alleged and for want thereof denies the same.

As To The Second Ground of Complaint.

1. The defendant, for its answer to paragraph 1, refers to the admissions and denials contained in the foregoing answer in response to paragraphs 1, 2, 8, and 9 of the First Ground of Complaint and begs leave to incorporate herein as though repeated the answers thereto heretofore made.

2. As to paragraph 2 the defendant is without accurate knowledge of the matters therein alleged and for want thereof denies the same and states that defendant's understanding is that Fayette County Gas Company is a corporation organized and existing under the laws of the State of West Virginia.

3. The defendant admits that the price charged by it to Fayette County Gas Company is and for some time past has been 31½¢ per thousand cubic feet for natural gas delivered at the West Virginia-Pennsylvania state line and that during the year 1937 it sold to Fayette County Gas Company 849,305,000 cubic feet of natural gas for a consideration of $267,531.10, and for want of information denies each and several the other allegations contained in paragraph 3.

3 4. For want of information the defendant denies each and several the allegations contained in paragraph 4.

5. The defendant denies each and several the allegations contained in paragraph 5.

6. The defendant admits the allegations contained in paragraph 6 except the allegations that all the natural gas sold by defendant to Fayette County Gas Company is "transported directly in interstate commerce" and that the price charged by defendant to Fayette County Gas Company is for the transportation of natural gas, which it denies.

As To The Third Ground of Complaint

1. The defendant, for its answer to paragraph 1, refers to the admissions and denials contained in the foregoing answer in response to paragraphs 1, 2, 8 and 9 of the First Ground of Complaint and begs leave to incorporate herein as though repeated the answers thereto heretofore made.

2. As to paragraph 2 the defendant is without accurate knowledge of the matters therein alleged and for want thereof denies the same.

3. The defendant admits that the price charged by it to The Manufacturers Light and Heat Company is and for some time past has been 31½¢ per thousand cubic feet and that during the year 1937 it sold to The Manufacturers Light and Heat Company 7,444,905,000 cubic feet of natural gas for a consideration of $2,345,145.11, denies that said price is for natural gas delivered at the Pennsylvania-West Virginia state line and avers that said deliveries are at Bates Measuring Station near Sedalia, Doddridge County, West Virginia. For want of information the defendant denies each and several the other allegations contained in paragraph 3.

4. For want of information the defendant denies each and several the allegations contained in paragraph 4.

5. The defendant denies each and several the allegations contained in paragraph 5.

6. The defendant admits the allegations contained in paragraph 6 except the allegations that all the natural gas sold by
4 defendant to The Manufacturers Light and Heat Company is "transported directly in interstate commerce" and that the price charged by defendant to The Manufacturers Light and Heat Company is for the transportation of natural gas, which it denies.

October 14, 1938.

In re Hope Natural Gas Company

Docket No. G-113.

## ORDER INSTITUTING INVESTIGATION

It appearing to the Commission that:

(a) The Hope Natural Gas Company, a corporation organized and existing under the laws of the State of West Virginia, owns and operates gas wells, field and gathering lines, and distribution facilities, located in the State of West Virginia, and transmission pipe lines extending from points in the State of West Virginia to the West Virginia-Ohio state line and to the West-Virginia-Pennsylvania state line;

(b) The Hope Natural Gas Company is engaged in the transportation of natural gas in interstate commerce and the sale of interstate commerce of naural gas for resale for ulimate public consumption for domestic, commercial, industrial, or other use, and is a natural-gas company within the meaning of the Natural Gas Act;

(c) Pursuant to Section 4 (c) of the Natural Gas Act and the Commission's Order No. 53, the Hope Natural Gas Company, on September 3, 1938, filed with the Commission its contracts and agreements covering the sale of natural gas to the East Ohio Gas Company, the Peoples Natural Gas Company, the Manufacturers Light and Heat Company, the Fayette County Gas Company, and the River Gas Company;

(d) In Docket No. G-100, on July 6, 1938, the City of Cleveland, Ohio, and in Docket No. G-101, on July 25, 1938, the City of Akron, Ohio, filed complaints with the Commission against the Hope Natural Gas Company, alleging that the price charged by the Hope Natural Gas Company to the East Ohio Gas Company, an affiliated company, for natural gas sold and delivered at the Ohio River for resale to domestic, commercial and small in-

dustrial consumers in the cities of Cleveland and Akron and elsewhere, is excessive, unjust, unreasonable, greatly in excess of the price charged by the Hope Natural Gas Company to nonaffiliated companies at wholesale for resale to domestic, commercial, and small industrial consumers, and greatly in excess of the price charged by Hope Natural Gas Company to the East Ohio Gas Company for resale to certain favored industrial consumers in Ohio and therefore unduly discriminatory between customers and between classes of service. Said complaints pray for an investigation by this Commission and a finding that the price charged the East Ohio Gas Company by the Hope Natural Gas Company for gas sold and delivered at the Ohio River is excessive, unreasonable, and unjustly discriminatory, and for the fixing of a just, fair and reasonable rate.

(e) The Hope Natural Gas Company, on August 18, 1938, and August 26, 1938, filed its answers to the complaints of the City of Cleveland and the City of Akron, respectively, in which it denies that the price charged by the Hope Natural Gas Company to the East Ohio Gas Company for natural gas for resale to domestic, commercial, and small industrial consumers is excessive, unreasonable or discriminatory;

(f) The Hope Natural Gas Company purchases substantial quantities of the natural gas which it transports, sells and delivers to the East Ohio Gas Company from the Clayco Gas Company, a corporation organized and existing under the laws of the State of West Virginia, and the South Penn Oil Company, a corporation organized and existing under the laws of the State of Pennsylvania, pursuant to the terms and conditions of contracts which were filed with the Commission by the Clayco Gas Company and the South Penn Oil Company on September 3, 1938, in compliance with Section 4 (c) of the Natural Gas Act and the Commission's Order No. 53;

Wherefore, the Commission finds that:

It is necessary and proper, in the public interest, and to aid in the enforcement of the provisions of the Natural Gas Act, that an investigation be instituted by the Commission, on its own motion, into and concerning all rates, charges, classifications, rules, regulations, practices or contracts of the Hope Natural Gas Company, and into and concerning the contracts, agreements and arrangements pursuant to which the Hope Natural Gas Company purchases natural gas;

The Commission, on its own motion, orders that:

(A) An investigation of the Hope Natural Gas Company be and is hereby instituted, for the purpose of enabling the Commission: (1) To determine with respect to said company, whether, in connection with any transportation or sale of natural gas subject to the jurisdiction of the Commission, any rate, charge, or classification demanded, observed, charged or collected or any rule, regulation, practice, or contract affecting such rate, charge, or classification, is unjust, unreasonable, unduly discriminatory, or preferential; and (2) if the Commission shall find that any such rate, charge, classification, rule, regulation, practice, or contract is unjust, unreasonable, unduly discriminatory, or preferential, to determine and fix by appropriate order or orders just, reasonable, and nondiscriminatory rates, charges, classifications, rules, regulations, practices, or contracts to be thereafter observed and in force;

(B) Said investigation shall include an inquiry into and the determination of the reasonableness and lawfulness of the purchase prices paid by the Hope Natural Gas Company for natural gas, including the prices paid to the Clayco Gas Company and the South Penn Oil Company.

By the Commission.

In the Matter of Hope Natural Gas Company

Docket No. G-113

## ORDER DISMISSING PETITION AND SUPPLEMENT THERETO REQUESTING MODIFICATION OF ORDER INSTITUTING INVESTIGATION

It appearing to the Commission that:

(a) On October 14, 1938, the Commission on its own motion, adopted an order instituting an investigation of the Hope Natural Gas Company for the purpose of enabling the Commission (1) to determine, with respect to said company, whether, in connection with any transportation or sale of natural gas subject to the jurisdiction of the Commission, any rate, charge, or classification demanded, observed, charged, or collected or any rule, regulation, practice, or contract affecting such rate, charge, or classification, is unjust, unreasonable, unduly discriminatory, or preferential; and (2) if the Commission shall find that any such rate, charge, classification, rule, regulation, practice, or contract is unjust, unreasonable, unduly discriminatory, or preferential, to determine and fix by appropriate order or orders just, reasonable and nondiscriminatory rates, charges, classifications, rules, regulations, practices, or contracts to be thereafter observed and in force;

(b) On January 9, 1939, the City of Cleveland, Ohio, filed with the Commission a petition praying that the Commission modify its order of October 14, 1938, to include an investigation whether Hope Natural Gas Company has violated the Natural Gas Act by charging to the receiving from The East Ohio Gas Company an unreasonable, unjust and discriminatory rate for natural gas delivered at the Ohio River on and since June 21, 1938, the effective date of the Natural Gas Act, at least insofar as the average charge made by Hope Natural Gas Company and payment re-

ceived from The East Ohio Gas Company has exceeded 30 cents per m. c. f.; said petition prays for a determination by the Commission that the Natural Gas Act has been so violated by Hope Natural Gas Company ever since June 21, 1938, and prays that the information concerning such matter be made available to The Public Utilities Commission of Ohio and to the City of Cleveland;

(c) On February 6, 1939, the Hope Natural Gas Company filed with the Commission its answer to said petition of the City of Cleveland, denying that the contract price charged for natural gas to The East Ohio Gas Company was on June 21, 1938, and at all times thereafter excessive, unjust, unreasonable, and discriminatory, and calling attention to proceedings before The
2 Public Utilities Commission of Ohio approving said contract price; said answer avers that the inquiry and determination requested in the petition filed by the City of Cleveland will be of no assistance either to the City of Cleveland or to The Public Utilities Commission of Ohio;

(d) On March 10, 1939, the City of Cleveland filed a supplement to its petition for a modification of the order of the Commission of October 14, 1938, reciting in said supplement that The Public Utilities Commission of Ohio has entered an order in the proceeding pending before it, that the decision of The Public Utilities Commission has been appealed to the Supreme Court of Ohio, and averring that an investigation and determination as prayed for in the petition should be of assistance to the City of Cleveland in the Supreme Court of Ohio and to the City of Cleveland and The Public Utilities Commission of Ohio on remand of the orders of said Public Utilities Commission of Ohio;

(e) On April 8, 1939, the Hope Natural Gas Company filed with the Commission its answer to said supplement to the petition of the City of Cleveland, alleging that the investigation and determination prayed for in the petition of the City of Cleveland will not be of any assistance to the City of Cleveland in the Supreme Court of Ohio;

It further appearing to the Commission that:

(f) The investigation of the Hope Natural Gas Company now in progress in this proceeding will include the compilation of information and data which will be relevant to the determination of just, reasonable, and nondiscriminatory rates and charges since the effective date of the Natural Gas Act, and

The Commission, having considered the said petition and supplement thereto of the City of Cleveland and the answers thereto of the Hope Natural Gas Company, finds that:

It will not be necessary to a full exercise of the power and authority of this Commission that said order of investigation, adopted herein on October 14, 1938, be amended or modified as requested by the City of Cleveland;

The Commission orders that:

The petition of the City of Cleveland, filed on January 9, 1939, praying for a modification of the order of the Commission of October 14, 1938, and the supplement to said petition, filed on March 10, 1939, be and they are hereby dismissed.

By the Commission.

## ORDER FIXING DATE OF HEARING

It appearing to the Commission that:

(a) In Docket No. G–100, on July 6, 1938, the City of Cleveland, Ohio; and in Docket No. G–101, on July 25, 1938, the City of Akron, Ohio, filed complaints with the Commission against the Hope Natural Gas Company, alleging that the price charged by the Hope Natural Gas Company to The East Ohio Gas Company, an affiliated company, for natural gas sold and delivered at the Ohio River for resale to domestic, commercial, and small industrial consumers in the cities of Cleveland and Akron and elsewhere, is excessive, unjust, unreasonable, greatly in excess of the price

charged by the Hope Natural Gas Company to nonaffiliated companies at wholesale for resale to domestic, commercial, and small industrial consumers, and greatly in excess of the price charged by Hope Natural Gas Company to The East Ohio Gas Company for resale to certain favored industrial consumers in Ohio and therefore unduly discriminatory between customers and between classes of service. Said complaints prayed for an investigation by this Commission and a finding that the price charged The Eat Ohio Gas Company by the Hope Natural Gas Company for gas sold and delivered at the Ohio River is excessive, unreasonable, and unjustly discriminatory, and for the fixing of a just, fair, and reasonable rate;

(b) On August 18, 1938, and August 26, 1938, the Hope Natural Gas Company filed its answers to the complaints of the City of Cleveland and the City of Akron in Docket No. G-100 and Docket No. G-101, respectively, in which it denied that the price charged by the Hope Natural Gas Company to The East Ohio Gas Company for natural gas for resale to domestic, commercial, and small industrial consumers is excessive, unreasonable, or discriminatory;

(c) In Docket No. G-113, on October 14, 1938, the Commission, on its own motion, adopted an order instituting an investigation of the Hope Natural Gas Company for the purpose of enabling the Commission (1) to determine, with respect to said company, whether, in connection with any transportation or sale of natural gas subject to the jurisdiction of the Commission, any rate, charge, or classification demanded, observed, charged, or collected or any rule, regulation, practice or contract affecting such rate, charge, or classification, is unjust, unreasonable, unduly discriminatory, or preferential; and (2) if the Commission shall find that any such rate, charge, classification, rule, regulation, practice, or contract is unjust, unreasonable, unduly discriminatory, or preferential, to determine and fix by appropriate order or orders just, reasonable and nondiscriminatory rates, charges, classifications, rules, regulations, practices, or contracts to be thereafter observed and in force;

(d) Said order instituting an investigation was duly served upon the Hope Natural Gas Company and was received by said company on October 15, 1938;

(e) In Docket No. G-127, on March 23, 1939, the Pennsylvania Public Utility Commission filed a complaint with the Commission against the Hope Natural Gas Company, alleging that the prices charged by the Hope Natural Gas Company to The Peoples

Natural Gas Company, the Fayette County Gas Company, and The Manufacturers Light and Heat Company, for natural gas sold and delivered at points on the Pennsylvania-West Virginia state line for resale in the State of Pennsylvania, are unlawful, excessive, unreasonable, and discriminatory, and said complaint prays for an investigation by this Commission of said prices and for the fixing of just, fair, and reasonable rates;

(f) On April 25, 1939, the Hope Natural Gas Company filed its answer to the complaint of the Pennsylvania Public Utility Commission in Docket No. G–127, in which it denied that the prices charged by the Hope Natural Gas Company to The Peoples Natural Gas Company, the Fayette County Gas Company, and The Manufacturers Light and Heat Company are unlawful, excessive, unreasonable, and discriminatory;

(g) Hope Natural Gas Company has in course of preparation a restatement of the cost of its property and plant and representatives of the Commission have been informed that such restatement studies are substantially completed and will be entirely completed within a comparatively short time;

The Commission *orders* that:

(A) A public hearing in these proceedings be held commencing on December 4, 1939, at ten o'clock a. m., in the Hearing Room of the Federal Power Commission, Hurley-Wright Building, 1800 Pennsylvania Avenue, N. W., Washington, D. C., and at said public hearing, pursuant to the provisions of Sec. 50.63 of the Provisional Rules of Practice and Regulations Under the Natural Gas Act, the order of procedure will be for the Hope Natural Gas Company to open and close these proceedings with the presentation of its evidence relevant and material to the question whether, in connection with any transportation or sale of natural gas subject to the jurisdiction of the Commission, any rate, charge, or classification demanded, observed, charged, or collected by said Hope Natural Gas Company, or any rule, regulation, practice or contract affecting such rate, charge, or classification, is unjust, unreasonable, unduly discriminatory or preferential;

(B) Docket Nos. G–100, G–101, G–113, and G–127 be and they are hereby consolidated for purposes of hearing thereon;

(C) Hope Natural Gas Company is hereby requested to submit at said hearing the restatement of the cost of its property and plant mentioned in paragraph (g) of this order.

By the Commission.

LEON M. FUQUAY, *Secretary.*

## STATEMENT OF COMPANY COUNSEL ON ORDER OF PROOF

Transcript pages 26–28

* * *

26 Mr. COCKLEY. There is one preliminary matter, if the Examiner please, and that has to do with the question raised by the Commission's order of October 3, 1939, which consolidated all of these complaints with an investigation by the Commission on its own motion, and directed, in accordance with the Provisional Rules of the Commission under the Natural Gas Act, and I am quoting this:

"That the order of procedure will be for the Hope Natural Gas Company to open and close these proceedings with the presentation of its evidence."

The Natural Gas Act, of course, does not place the burden of proof in a technical sense upon the company unless the com-
27 pany is asking for an increase of rates or a change of rates, or is asking for some other relief. The Hope Company in this case has not as yet, at least, made any application for an increase of rates. It has not petitioned for any relief. Complaints have been filed against it by the cities of Cleveland and Akron, and by the Pennsylvania Commission, charging in the most general terms that their rates are unreasonable and discriminatory. Those complaints do not advise the Hope Company in any respect in which it is claimed that the rates are unreasonable and discriminatory—just a general charge.

Now, we are not disposed to quarrel with the order of the Commission designating that we go forward first, although it seems to us a little unusual to require the defendant company to come in and present evidence to refute charges that have not yet been substantiated or have not even been specified with sufficient definiteness that any one can tell what the charges are. We assume that the Commission in making that order is doing it pursuant to a discretion that it has to conduct its own investigation in any way that it sees fit, and if it wants to conduct its investigation by designating the order of proof, without changing the burden of proof in any respect, we see no objection and will be glad to cooperate with that method of procedure, but we do want to have it noted that the Hope Company itself is not thereby, by going forward
28 in the first instance, is not thereby assuming any burden of proof, because it does not lie upon the Hope Company under

the Act, but that it is reserving all of its rights under the Act and under the law as it has been interpreted by the courts many times that the burden of proof is always upon the man who makes the charge and not upon the man who is defending it. With that reservation, we are willing to proceed in accordance with the orders of the Commission.

## ORDER FIXING DATE FOR HEARING ON MOTION FOR AN IMMEDIATE ORDER REDUCING RATES

It appearing to the Commission that:

(a) On July 6, 1938, a complaint was filed by the City of Cleveland against the rate charged by defendant Hope Natural Gas Company to its affiliate, The East Ohio Gas Company, for gas produced in the State of West Virginia and delivered at the Ohio River for transportation to and resale in Cleveland, and it prayed for an investigation by the Federal Power Commission, a finding that said River Rate is excessive, unreasonable, and unjustly discriminatory, and for the fixing of a just, fair, and reasonable rate;

(b) On July 25, 1938, a complaint was filed by the City of Akron against Hope Natural Gas Company, alleging that the price charged by the Hope Natural Gas Company to The East

Ohio Gas Company, an affiliated company, for natural gas sold and delivered at the Ohio River for resale to domestic, commercial and industrial consumers in the City of Akron and elsewhere, is excessive, unjust, unreasonable, greatly in excess of the price charged by the Hope Natural Gas Company nonaffiliated companies at wholesale for resale to domestic, commercial and industrial consumers, and greatly in excess of the price charged by Hope Natural Gas Company to The East Ohio Gas Company for resale to certain favored industrial consumers in Ohio and therefore unduly discriminatory between customers and between classes of service;

(c) On August 18, 1938 and August 26, 1938, the Hope Natural Gas Company filed its answers to the complaints of the City of Cleveland and the City of Akron, respectively, in which it denied that the price charged by the Hope Natural Gas Company to The East Ohio Gas Company for natural gas for resale to domestic, commercial, and industrial consumers is excessive, unreasonable, or discriminatory;

(d) On October 14, 1938, this Commission, on its own motion, ordered an investigation of the Hope Natural Gas Company for the purpose of enabling the commission:

"(1) To determine with respect to said company, whether, in connection with any transportation or sale of natural gas subject to the jurisdiction of the Commission, any rate, charge, or classification demanded, observed, charged or collected or any rule, regulation, practice, or contract affecting such rate, charge, or classification, is unjust, unreasonable, unduly discriminatory, or preferential; and (2) if the Commission shall find that any such rate, charge classification, rule, regulation, practice, or contract is unjust, unreasonable, unduly discriminatory, or preferential, to determine and fix by appropriate order or orders just, reasonable, and nondiscriminatory rates, charges, classifications, rules, regulations, practices, or contracts to be thereafter observed and in force;

"Said investigation shall include an inquiry into and the determination of the reasonableness and lawfulness of the purchase prices paid by the Hope Natural Gas Company for natural gas, including the prices paid to the Clayco Gas Company and the South Penn Oil Company."

(e) On March 23, 1939, the Pennsylvania Public Utility Commission filed a complaint with the Commission against the Hope Natural Gas Company, alleging that the prices charged by the

Hope Natural Gas Company to The Peoples Natural Gas Company, Fayette County Gas Company, and the Manufacturers
3 Light and Heat Company, for natural gas sold and delivered at points on the Pennsylvania-West Virginia State line for resale in the State of Pennsylvania, are unlawful, excessive, unreasonable, and discriminatory, and prayed for an investigation by this Commission of said prices and for the fixing of just, fair, and reasonable rates, and that on April 25, 1939, the Hope Natural Gas Company filed its answer to the complaint of the Pennsylvania Public Utility Commission;

(f) On October 3, 1939, the Commission entered an order consolidating Docket Nos. G–100, G–101, G–113, and G–127 for hearing and fixed the date for the first hearing which was subsequently postponed to April 1, 1940, upon the request of Counsel for the Hope Natural Gas Company;

(g) Since April 1, 1940, hearings have been held from time to time in Clarksburg, West Virginia, and at those hearings the defendant-respondent company has appeared by counsel, has had full opportunity to be heard, has offered and presented both oral and documentary evidence, has been subjected to cross-examination, has engaged in redirect examination, and has presented all the evidence relating to the issues herein which it chose to present in opening the proceedings as directed by the Commission's order of October 3, 1939;

(h) On April 2, 1940, the Commission granted petitions to intervene filed by the Public Service Commission of West Virginia and the State of West Virginia;

(i) On September 23, 1940, Counsel for the Cities of Cleveland and Akron, Ohio, filed a "Motion for an Immediate Order Reducing Rates", which had a certificate attached showing service by mail upon all parties;

(j) In the motion it is moved "that the Commission enter an immediate order for a Hope-East Ohio rate reduction of approximately $662,000 per year, and that the Commission fix just and reasonable rates for gas sold by Hope Natural Gas Company to The East Ohio Gas Company for natural gas delivered at the Ohio River for resale to consumers in Cleveland, Akron, and elsewhere effecting said reduction upon the Hope company's own testimony herein, without prejudice to the power and authority of the Commission to find said reduced rates excessive upon the testimony of the Commission's staff to be hereafter offered in evidence, and without prejudice to the power and authority

of the Commission to further reduce said River Rates upon its own motion or otherwise at any time hereafter, upon good cause shown; and that the Commission proceed immediately to fix by order dates for briefs and oral argument upon this motion.";

4. (k) The specific allegations or grounds for said motion are more fully set out therein and the same are hereby incorporated herein and made a part hereof;

The Commission, therefore, orders that:

(A) The "Motion for an Immediate Order Reducing Rates" be and it is hereby set down for hearing before the Commission, *en banc*, on November 20, 1940, at 10:00 a. m., in the hearing room of the Federal Power Commission, 1800 Pennsylvania Avenue, N. W., Washington, D. C., at which time counsel for the respective parties may present oral argument;

(B) Main briefs in support of or in opposition to said motion shall be filed on or before November 1, 1940; reply briefs shall be filed within ten days after November 1, 1940.

By the Commission.

## ORDER DENYING MOTION FOR AN IMMEDIATE ORDER REDUCING RATES

Upon consideration of the joint "Motion for an Immediate Order Reducing Rates" for natural gas sold at wholesale by Hope Natural Gas Company to the East Ohio Gas Company, filed by the Cities of Cleveland and Akron, Ohio, on September 23, 1940; the main and reply briefs in support of the joint Motion filed by the Cities; the main and reply briefs and exceptions to the Cities' proposed findings filed in opposition by Hope Natural

Gas Company; the exceptions, objections and joint motions of the State of West Virginia and the Public Service Commission of West Virginia filed on November 20, 1940, with respect to the Cities' Motion; the oral arguments on the Cities' Motion presented to the Commission sitting en banc on November 20, 1940, by counsel on behalf of the Cities, the Company, the State of West Virginia and the Public Service Commission of West Virginia and the entire evidence adduced of record in the above-entitled proceedings;

The Commission finds that:

There is insufficient evidence of record, at this time, to support the prayer for relief requested by the movants;

The Commission orders that:

(A) The joint motion of the Cities of Cleveland and Akron, Ohio, for an immediate order reducing rates for natural gas sold at wholesale by the Hope Natural Gas Company to the East Ohio Gas Company be and it is hereby denied without prejudice;

(B) This order is not to be construed as a determination of any of the issues in the pending principal proceedings involving the reasonableness of the interstate wholesale rates of the Hope Natural Gas Company, but is confined to the merits of the present joint motion filed by the Cities of Cleveland and Akron, Ohio.

By the Commission.

LEON M. FUQUAY, *Secretary.*

2180 **STATEMENT OF COMMISSION COUNSEL ON THE ISSUES**

Transcript pages 2180-2182

Mr. STRINGER. Mr. Examiner, I should like to make an opening statement at this time.

In order that there will be no doubt about the issues in this rate case, I should like to outline what will be shown by the facts, which the Commission's staff will present beginning today.

Considering the rate base first—we will present evidence which will show that the Hope Natural Gas Company's prudent investment or adjusted book cost, in other than distribution property and before allocation, as of December 31, 1938, is approximately $51,200,000. Hope Natural Gas Company's book reserve for depreciation and depletion, excluding specific distribution system reserves, totaling $39,320,000, appears to be excessive as a measure of the accrued depreciation and depletion in the Company's property, so we will present evidence, based upon the straight-line and production depreciation methods, to show that the depreciation and depletion reserve requirement relating to the above property is about $23,500,000, and that this is the best measure of the accrued depreciation and depletion in the property. It may be noted that the excess of the Company's book reserve over the reserve requirement is about $15,800,000, which might be considered capital contributions made by consumers in the past and the total book reserve might be deducted equitably in determining the rate base.

2181 We have exposed the fundamental defects in the Hope Natural Gas Company's trended original cost, its estimated reproduction cost new, and its claimed "observed-accrued" depreciation by cross-examination, but we may elect to present concise rebuttal evidence on these three subjects in addition.

The Company's misnamed, but claimed "original cost" contains about $17,000,000 which the Company did not choose to capitalize in the past by election of the management, but which it now attempts to capitalize retroactively. We disagree on principle with this attempt to place multiple charges on the consumers and we will recommend to the Commission that the rate base in this case be predicated upon the only reliable evidence which the record will contain, that is, the Company's prudent investment or adjusted book cost of approximately $51,200,000, in other than distribution property and before allocation, less the depreciation and depletion

reserve requirement of approximately $23,500,000, plus working capital of about $2,000,000, which produces a depreciated rate base of about $29,700,000 for the end of 1938. Of course, we will present evidence to bring all these figures up to date.

We will present the facts which will enable the Commission to determine: (1) Whether the Company's gas reserves are adequate;

(2) whether the Company pays a reasonable price for the
2182 great quantity of gas which it purchases; and (3) whether Hope Natural Gas Company receives a fair price for the gasoline extracted from its gas by its affiliate, Hope Construction and Refining Company. Until the Company presents more convincing proof of the portion of its investment in its 600,000 unoperated acres which is devoted to its gas service and is useful in the reasonably near future, we will recommend that the entire amount be excluded from the rate base and that the related delay rentals be excluded from the allowable operating expenses. We will also present appropriate evidence showing the revenues, expenses and resulting operating income of the Hope Natural Gas Company.

We will present facts relevant to the rate of return which is fair and reasonable for the Hope Natural Gas Company.

We intend to present evidence to show the segregation of the Company's revenues, operating expenses, depreciation, depletion and return as between its intrastate and interstate business.

Considering Hope's operating income and applying a reasonable rate of return to the recommended depreciated prudent investment rate base, there is indicated a substantial reduction in the interstate wholesale rates of the Hope Natural Gas Company.

## ORDER (1) DENYING APPLICATION FOR SERVICE OF TRIAL EXAMINER'S REPORT AND (2) GRANTING ORAL ARGUMENT

Upon application of Hope Natural Gas Company, filed September 30, 1941, requesting, as separate application, (1) that any trial examiner's report in this proceeding be served upon it, and (2) that it be granted oral argument before the Commission en banc;

It appearing to the Commission that:

(a) Section 19 (a) of the Natural Gas Act provides in part as follows:

Any person, State, municipality, or State commission aggrieved by an order issued by the Commission in a proceeding under
2 this Act to which such person, State, municipality, or State commission is a party may apply for a rehearing within thirty days after the issuance of such order. The application for rehearing shall set forth specifically th ground or grounds upon which such application is based. Upon such application the Commission shall have power to grant or deny rehearing or to abrogate or modify its order without further hearing * * *;

(b) Under this provision of the Act any aggrieved party, in its application for rehearing, may take exception to any or all findings of the Commission, its failure to make necessary findings, or any order or conclusions embodied in the opinion or order of the Commission;

(c) Such statutory procedure provides a direct and adequate means of excepting to any part of the Commission's order by which a party deems himself aggrieved and avoids the cumbersome and frequently futile procedure of taking exceptions to the merely advisory findings and conclusions of the examiner, many of which may not be accepted by the Commission or be incorporated in the Commission's order.

Wherefore, the Commission orders that:

(A) Applicant's request for service upon it of any trial examiner's report which may be made herein be and the same is hereby denied;

(B) Oral argument on the issues raised at the hearing herein be had before the Commission, en banc, on October 27, 1941, at 9:45 a. m., in the Hearing Room of the Commission, 1800 Pennsylvania Avenue NW., Washington, D. C.

By the Commission.

## ORDER DENYING APPLICATION FOR REHEARING

Upon consideration of the application filed on October 23, 1941, by Hope Natural Gas Company requesting reconsideration and rehearing with respect to the Commission's order of October 3, 1941, which denied the application for service of the Trial Examiner's Report, but granted oral argument;

The Commission finds that:

Hope Natural Gas Company has been fairly and fully advised of the legal and factual issues in these proceedings; it has had full opportunity to test, explain or refute the evidence of record and to meet the legal and factual issues involved, both by brief and oral argument before the entire Commission; and will have available,

to it the procedure recited in paragraphs (a), (b), and (c) of the Commission's order of October 3, 1941;

Wherefore, the Commission orders that:

Applicant's request for a rehearing with respect to the Commission's order of October 3, 1941, be and it is hereby denied.

By the Commission.

## ORDER DENYING PETITION FOR REHEARING AND STAY

Upon consideration of the petition of Hope Natural Gas Company filed June 24, 1942, for rehearing and stay with respect to the Commission's findings as to lawfulness of past rates and order reducing rates of that Company entered on May 26, 1942, and the Commission's Opinion No. 76; and upon further consideration of all previous orders in these proceedings, the evidence of record, the briefs and oral arguments, and adhering to its Opinion No. 76, findings as to lawfulness of past rates and order of May 26, 1942, reducing rates;

The Commission finds that:

No new facts have been presented or alleged in the petition for rehearing which would justify a reversal or revision of the Commission's Opinion No. 76, findings as to lawfulness of past rates and order reducing rates, entered May 26, 1942, and no principles

of law are stated in the petition for rehearing and stay which were not fully considered by the Commission before it rendered said opinion, findings and order;

The Commission, therefore, orders that:

The petition for rehearing and stay be and it is hereby denied.

By the Commission.

## TESTIMONY OF HOPE WITNESS RHODES ON ESTIMATED COST TO REPRODUCE HOPE'S PLANT

Transcript pages 529–761

* * *

529 Cross-examined by Mr. SPRINGER:

Q. Mr. Rhodes, you are a stockholder in Ford, Bacon & Davis, are you not?

530 A. That is correct.

Q. And you are also a stockholder in the Standard Oil Company (New Jersey)?

A. Yes.

Q. And the Ford, Bacon & Davis firm has a contract for valuation and other services, I understand, with the Standard Oil Company of New Jersey and its subsidiaries, has it not?

A. It has a contract with one of its subsidiaries, which performs services for various natural gas companies, namely, Gas Company, Incorporated.

Q. Do you know the annual income derived from that contract?

A. I do not recall what it is; no.

Q. It is substantial, is it not?

A. Oh, yes. The Standard Oil Company of New Jersey is one of our more important clients.

Q. Are you directly responsible for unit costs of all construction and overheads used in this reproduction cost new estimate?

A. I specified the principles to be followed in determining these unit costs, the methods of ascertaining labor rates that would have to be paid, the prices that would have to be paid for materials, and I sat in and consulted freely and continuously with the men

531 responsible for the detail work of the various classes of construction.

Q. Did you use costs observed or used on other projects which you listed on pages 6 and 7 of Exhibit 16, to arrive at the unit cost used in the reproduction cost new estimate here?

* * *

Q. That is on pages 6 and 7 of Exhibit 16-A.

A. The costs in some of these projects and also the more than 45 years of experience of Ford, Bacon & Davis were called upon, as well as my own personal experience, extending over 35 years—they represent a composite judgment which is based on all of that experience.

Q. Have you had personal experience in a particular construction project which is similar to the Hope System?

A. Yes.

Q. Will you describe that, please?

A. The construction of the Southern Natural Gas Corporation's system as a whole was handled under my immediate direction in the field, and simultaneously the pipe line construc-
532 tion of the Mississippi River Fuel Corporation.

Q. Can you give us the dollar amount of the construction, approximately?

A. About 35 million dollars in that particular sphere of operations that were under my direction, which was carried out in the period of about a year.

Q. Exactly what did you do in that construction project?

A. On the Southern Natural Gas Company's construction project, Ford, Bacon & Davis were the agents of the owners, the agents for the Company. The Company itself had previously decided to carry out the construction itself, got into difficulties, and called us in to help them and act as their agents. The company's own organization carried on relations largely with public authorities and matters of purely a corporate nature. They carried on the immediate relations with the bankers in getting the money, and I was responsible for everything else.

Q. You mean that you were the resident engineer?

A. I was more than that: I was the officer of Ford, Bacon & Davis acting and functioning as agents for the Southern Natural Gas Corporation in that entire operation.

Q. Did you supervise the acquiring of the right of way?

A. Not personally; no.

Q. How many days did you spend in the field on the
533 project?

A. The work of directing between these two jobs, some $35,000,000 in one year, is essentially an executive job. I spent probably a third of my time away from the office on various construction operations where there was some difficulty or something requiring special attention.

Q. Did you have prepared a reasonably accurate analysis and summary of the costs of construction of natural gas projects which you say you supervised?

A. The accounting on that project was all handled by men working under my direction. The men in charge of the accounting later continued with the company as the accounting department of the

company after curtailing, of course, the additional men required in the construction period.

I had no specific analysis of the cost of construction made in the form of the unit costs of all operations. I did purchase in our office, without other officers—we did purchase the pipe. I let most of the contracts for the construction and the portions of the construction that were built with our force account. I organized the personnel to build those portions of the property.

Q. Have you ever had responsible charge of construction of natural gas properties in West Virginia?

A. The only construction work with which I have been
534 connected in West Virginia was the construction of a 60-mile pipe line to carry liquid propane from the Kentucky state line to South Charleston, West Virginia.

Q. Is that construction comparable with the construction required in a natural gas pipe line system?

A. The methods of construction are the same; yes.

Q. Are the materials?

A. They are the same; yes.

Q. Exactly what did you do on that project?

A. Well, as the——

Q. (Interrupting.) You were the Chief Executive?

A. I was the principal executive in Ford, Bacon & Davis on construction matters. I personally negotiated and secured the contract for the building of the line. I approved the specifications, discussed the planning of the line with the owners, on account of the special features of the liquid to be carried, and otherwise spent comparatively little time on the line.

Q. Have you had responsible charge of the construction of natural gas properties in Pennsylvania?

A. Only in an executive capacity.

Q. And in Ohio?

A. In Ohio the same is true. Pipe line construction—it should be designated as that, because our only construction work
535 in Ohio along the lines of the natural gas business was a gasoline pipe line from Toledo to Detroit.

Q. Was that construction project comparable to a natural gas system construction?

A. The methods of construction and the materials used are identical.

Q. What other natural gas construction have you supervised in the Appalachian area?

A. There are no important projects other than those which have been named.

Q. And for all of these projects, you have not analyzed the costs of construction for purposes to be used in this reproduction cost new exhibit 16–A to I, inclusive?

A. On the construction work which we ourselves have carried out, namely this liquid propane line in West Virginia and on a gasoline pipe line in Pennsylvania, and this gasoline pipe line from Toledo to Detroit, together with a considerable number of other projects, we have analyzed the costs. The particular ones that were named were actually constructed by us, and of course, we have all of the cost records available.

Q. And did you use them in preparing the reproduction cost new estimate in this case?

A. We used them in guiding our judgment as to what was the proper performance of men and machines in West Virginia.

536 Q. Are those analyses available for the Federal Power Commission engineers?

A. The analyses which enable one to form his judgment and to reflect the considerable experience of an engineering organization such as ours, I have not considered as being appropriate material for working papers. They are not in convenient form to be understood by others. Analyses are, in general, in such work, not carried to the finished condition of the completion of working papers that are to be prepared for examination by others. Incidentally, in connection with those papers are costs and information with respect to the construction of other lines that were given to us in confidence and we cannot make them available to anybody.

Q. Do you mean that we must read your mind, that we cannot have access to the foundation of the reproduction cost new estimate?

A. We should be very glad to show a competent, experienced engineer, familiar with natural gas construction, the process which we went through in arriving at our final conclusion as to performance, but I should want to point out that those working papers are not complete and that there are some parts of it which were given us in confidence, that we could not show.

Q. Can you tell us now what weight you gave to those cost analyses in preparing this estimate of reproduction cost

537 of the Hope System?

A. Well, with respect to pipe lines, these cost analyses compared with experience and supervising the construction and estimating in advance the cost of some several thousand of miles

of pipe lines, that experience had to be used in analyzing the costs. The costs of lines are affected by more things than appear on the face of it. I have clearly in mind two construction jobs which we had cost records on, one of which was constructed in ordinary weather and the other of which was constructed in just about the wettest period that has ever existed in the territory involved. The lines were of the same size, the country was very similar, but the one built in wet weather cost fully twice as much as the one built in dry weather. I am talking now about the laying costs.

Now, in analyzing these various costs, it is necessary to know the facts, or you can be very badly misled, and incidentally this wet weather experience of ours was ignored, except to the extent of measuring the possible effects of the normal rainfall in country such as West Virginia.

Q. Then, in your assumed construction period of three years for your reproduction cost estimated of the Hope System, that was related to normal weather conditions of West Virginia?

A. That is correct; the normal amount of rainfall, and assumed no attempt to work at all in the worst two months of
538 the winter, generally January and February.

Q. Are the laying costs which you used in reproduction cost new comparable to the described costs of wet-weather construction experience that you have just named?

A. The reproduction costs or cost of laying pipe lines, which is what we are talking about, is based on weather conditions that are normally to be expected in ten months of the year in West Virginia.

Q. Is that lower or higher than the experience of the wet weather conditions which you described previously?

A. Much lower.

Q. Then you will make available the average cost analyses to our engineers?

A. I will be glad to have those analyses explained to an experienced pipe line engineer, but it is understood, however, as I explained before, they are nebulous, and some of it cannot be shown.

Q. Nebulous and hypothetical?

A. Not at all hypothetical. The costs are facts, and this valuation is based on facts.

Q. Nebulous facts?

A. No. I said the working papers are not complete to the extent that working papers need to be carried to be made available in the independent examinations of others. You do not

539 label things. They serve your purpose and then you are through with them.

Q. Do you have a uniform formula for analyzing costs of construction projects?

A. No.

Q. In preparing your reproduction cost new estimate, Exhibits 16-A to I, inclusive, what consideration did you give to the actual experience of the Hope Company in the construction of its property as recorded on its books?

A. The performance of men in handling pipe line construction by the company during the year 1925 was given careful consideration. The book records were available as to the performance of men, and this experience of the Hope Company during periods of heavy construction, was one of the guides to the final conclusion which we reached.

Q. Does the extent of your reliance on that information show in your working papers?

A. No. The engineers in reaching conclusions as to what is the fair and proper average cost or average performance do not specifically weight specific things. They take into account all of the facts that are at their command at the time, and they temper those facts with knowledge of the conditions under which the construction is carried out. They take into account their other

540 experiences on other projects, and reach a final conclusion, and the process of getting the final answer is not mathematical.

Q. You say that your experience has been mostly as an executive on pipe line construction. Do you mean that you have assistants who are experienced men and convey from their minds to yours these various elements that go to make up the costs?

* * *

The WITNESS. Well, as to the first part of the question, I have not worked in the ditch. My responsibility has extended from executive work where I was immediately responsible, and I spent quite a lot of time in the field on actual construction. A great deal of the work is far from executive when there is trouble. It has extended from that on some projects to, as I explained before, the complete executive charge of a large operation such as that of the Southern Natural Gas Company.

With respect to the second part of the question, I have assistants working for me, and who worked on this job, who themselves have actually been out in the field, men who have worked in the ditch in

West Virginia and know what can be gotten out of the men.

541 These results represent the combined opinion of these men, and they place before me the facts of their own respective kinds of experience, and I reached the final conclusions as to the basic performances to be used, based on their experience, extending, as I say, right down to the man in the ditch.

The TRIAL EXAMINER. Their experience was recorded, was it not?

The WITNESS. My experience, yes.

The TRIAL EXAMINER. No; their experience. That is, the experience of the man in the ditch and the man who stands on the side of the ditch is recorded as to the productivity of the men and the machines, from day to day from week to week and from month to month, is it not?

The WITNESS. Yes; but generally the cost accounting, during the construction of a pipe line, particularly that of contractors, is carried out in the manner to assist them in bidding on future jobs. No two pipe line constructors use the same method of cost accounting. The contractor changes his methods from job to job, and for that reason the records of construction of several contractors or several job foremen cannot be put down in a table and added up and divided to get the answer. It is necessary to find out what they mean.

The TRIAL EXAMINER. Do you and your assistants always use the same methods at the same time?

542 The WITNESS. My job was to bring these things so that they were talking the same language, and that the fellow that directed the job as an executive would talk the same language as the fellow that was the job foreman.

The TRIAL EXAMINER. What I am trying to find out is how you found out that you were talking the same language.

The WITNESS. Because, having known these men for many years, you learn their language.

The TRIAL EXAMINER. I judge then that they always used the same method, is that correct?

The WITNESS. They generally mean the same thing by the same words, and it is quite important in building up a composite result of their experience, to do that. Your field men, for instance, that is, the foreman out on the job, he is very prone to thing of performance as the time that he can boast about when he has been able to get a good day. The executive responsible for the job discounts that, and if he is responsible for putting in a bid, he has a tendency

to overdiscount it, the same way as the actual construction foreman has boasts in his ideas.

All of those things have to be ironed out, and they have been ironed out at the expense of a great deal of effort in this particular job.

The TRIAL EXAMINER. The effect of that is that the
543 estimate of costs which might be made on the basis of the field man's experience would be increased by the action you would take on that information; is that not true?

The WITNESS. In general that is so; yes. The field man——

The TRIAL EXAMINER (interrupting). Well, it is a fact, is it not, that your estimate of the costs of a proposed project is based on your actual experience in connection with the actual construction of similar projects?

The WITNESS. That is right.

The TRIAL EXAMINER. And that experience is recorded, is it not?

The WITNESS. It is recorded in the working papers, yes, sir.

The TRIAL EXAMINER. And in making your estimate of the cost of this proposed project, you referred, I presume, to those recorded costs, did you not?

The WITNESS. The starting point of the estimate—unit price estimates—in the working papers here, is the composite result of our experience. We do not start de novo on every valuation or every reproduction cost determination which we make, and build the costs all over again. Some of these unit costs, particularly in matters of building construction, of the type involved here,
544 have been used by us for so long, that we do not redetermine.

In connection with pipe line construction, we started with certain basic performances of men and machines, of sizes and kinds of pipe lines that control the type of equipment that you will use.

Now, in arriving at those basic performances, that is the job that we have to do in advance of preparing unit costs, and it is work that is done not only in connection with this particular piece of work, but with a lot of pieces of work that we have been and are doing.

As I say, there are working papers in our own private files that could be explained in rather considerable complexity to an examining engineer.

The TRIAL EXAMINER. You start then with the same basis in making your estimate with respect to every project?

The WITNESS. All of the work that we have done recently in pipe line construction, for instance, starts from this same experience

of ours, but it was only within the past two or three years that I have attempted to bring together in concrete form this diversified experience of our firm and this work here represents that experience after pretty careful and thorough study of our experience and experience of the men.

The TRIAL EXAMINER. You may proceed.

By Mr. SHRINGER:

545. Q. Mr. Rhodes, did I understand that a composite judgment of the analysis of construction costs is the basis for your unit cost development in this case?

A. That does not, I think, quite represent what I have in mind, but it is the joint opinion of our men experienced in pipe line construction work.

Q. When you speak of your men experienced in pipe line construction, are all of those men experienced in pipe line construction in West Virginia in the area covered by the Hope system?

A. No.

Q. Then you may have in your composite judgment, a man's idea of unit costs in the Panhandle region as compared with the Appalachian area?

A. Such costs were taken into account. The method of arriving at costs was not to say "Well, here is West Virginia and it costs so much in West Virginia." A hill is a hill, whether it is in West Virginia or Alabama, or where it may be, and the contour of the ground and the roughness of the ground is measurable by the steepness of the hill, and if a pipe line is to be built up a hill of a certain steepness, it does not make any difference what state it is in. The time required to lay that line both as to machines and as to men

546 is practically the same in West Virginia as elsewhere. It is more in West Virginia, for instance, than the same hill would be in Arizona, because it rains more in West Virginia, but basically, the costs are about the same.

If you get flat country, of which there is a little, but not much, in West Virginia, it does not make any difference whether you are laying pipe line in West Virginia or where you are laying it, in our experience in arriving at the unit costs of laying pipe lines here, analyzing the experience in every conceivable kind of country, from country where pipe lines cost less than half as much as they do in West Virginia, to places where pipe lines on the average cost twice as much as they do in West Virginia. We have taken into account all of the various kinds and classes of countries.

Q. Then did you give the West Virginia appraisal its relative weight in your composite judgment?

A. We made a very extensive field survey of the construction conditions in West Virginia. The 1,300 miles trunk line, for instance, were very thoroughly surveyed. They were seen at every place where they could be gotten at with reasonable facility, and then on the remainder an extensive portion was actually walked by our construction men to find out just what construction conditions would be encountered.

With respect to the smaller lines that were not the trunk lines, an extensive sampling of roughly ten percent was selected
547 covering the whole territory, and those lines were studied and their construction conditions determined.

The result of it is that we actually know the construction conditions in detail that would be encountered on something more than 2,000 miles of pipe line built by this company.

Q. Was the Hope Company's experience over those same pipe lines that your men walked available to you?

A. The Hope Company's experience on the lines, the major lines, built in 1925 when they were extended south into Boone County, the company's labor performance in connection with that line was studied, in conjunction with the actual construction conditions encountered or to be encountered in building the line today. Not as they were then. They used oxen when the built that line, they use tractors today.

Q. You say that you had assistants available who had dug pipe line ditches in West Virginia. Will you name those men for us?

A. I stated that I had one. His name is Evans.

Q. Did he tell you what his conception of labor performance was in West Virginia for pipe line construction?

A. He sat down with us and we discussed very thoroughly the performance of labor under the various kinds of conditions
548 and the different degrees of hilliness and so forth, and he accepted the figures, as we finally used them.

Q. You spoke of using modern equipment in the performance basis of your reproduction cost new estimate. I assume the cost would be less than was actually experienced then or twenty or forty years ago by the Hope system?

A. When Hope's main lines were built, they had some construction equipment, but they were largely hand jobs. We found on careful analysis that aside from equipping the various gangs with tractors, with side booms and winches to assist in handling the pipe

and snaking it or skidding it through the woods, we found that it did not pay to use machinery in West Virginia. There are places, many places, where machines could be used advantageously, if you could get the machines there, but it costs so much to move this heavy ditching machinery from place to place, from the good places to other good places, over ravines and across streams, that the cost of moving fully offset the advantage of these machines.

So, as it stands today, the laying of a pipe line in West Virginia, assuming the same rate of wages, would be somewhat lower, because there are better roads, and more things of that nature, but there would not be any very great difference.

549 Q. Do you know that a 92-mile transmission pipe line was built partially with machine ditching in the Hope system?

A. Yes, I do.

Q. And have you reproduced that section of the property with hand ditching?

A. The particular line in question was not specifically estimated. The unit costs were developed to fit the country encountered in each size of line, and the lines over—in one line, for instance, that is not the only line of that size.

For instance, we found the average construction conditions to be encountered by all 12-inch lines, the unit cost for all 12-inch lines were built up to meet those average conditions.

The constractor on the line in question which you have, it was well known, lost money.

Q. How do you know that?

A. Because I have a letter from that contractor telling me what it cost him to build the line and how much he received for it.

Q. May we have access to that letter?

A. That was given to me in confidence.

Q. Will you tell us how much money he lost?

A. I don't recall the exact figures, but the pipe-laying contractor received a payment for the work, I think approximately

550 his cash out-of-pocket costs in laying that line, without anything to cover his general office overhead or the use of his machinery, let alone any profit.

Q. Was he an experienced pipe line constructor?

A. Yes.

Q. And you reproduced the same line with hand ditching and the other elements for more or less than he was paid for the job?

A. It would be more than he was paid for the job, yes, sir.

Q. You took into consideration the confidential letter in reaching your estimate?

A. That letter was one of the letters, one of the pieces of information which was given me in confidence, which I had in mind as the experience which helps us to determine what the true costs of laying pipe lines were in West Virginia.

Q. Do you know what proportion of pipe lines of the Hope Company were built by contractors?

A. Comparatively small portion. Just what proportion was built, I do not recall.

Q. Would it be ten or twenty per cent?

A. I have not in mind the figure at all.

The TRIAL EXAMINER. Do you know whether this contractor set out with the idea of losing that much money on the job?

The WITNESS. No, he set out with the idea of making
551 money; there is no doubt of that.

The TRIAL EXAMINER. He made a mistake in estimating costs?

The WITNESS. He did. He estimated it too low.

By Mr. SPRINGER:

Q. In your estimate, you would make a handsome profit, would you, for the construction of that same pipe line?

A. No.

Q. With hand ditching, where machine ditching was actually used?

A. The machine ditching was used at an expense that was, as nearly as can be ascertained, about the same as the hand ditching. They dug the ditch with machine very cheaply, but they spent a lot of money getting the machine from hill-top to hill-top, and that is our experience in the line at South Charleston. We used a machine on one part of that job, which should have resulted in a reduced cost of ditching, but as a matter of fact, the total cost of the ditch in the part that was dug by machine, including the machine wear and tear, was greater than the part that was done wholly by hand.

Q. Do you know whether any other pipe lines at that time were built for the Hope Company by a contractor?

A. I don't recall any other important line that was
552 built by contract.

Q. What proportion of pipe lines in your reproduction cost new estimate have you assumed would be built by contractors?

A. I have assumed that they would all be built by contractors in accordance with the practice of the industry, when large projects are built.

Q. From your familiarity with the construction of the Hope system, would you say that it was built within three years or built up gradually, over a period of forty years?

A. It was obviously built up over a period of forty years.

Q. And you have assumed a construction period of three years?

A. That is correct.

Q. Then would you characterize the development of the Hope system as piecemeal?

A. Some of it.

Q. Are you familiar with the construction of pipe line designated as H-162, that was built in 1925?

A. That pipe line was one of the lines, the performance on which was available when we arrived at our performance figures.

553 Q. Would wholesale construction costs be lower than piecemeal construction costs, for pipe lines in West Virginia and the Hope Company in particular?

A. That depends on where you draw the line between piecemeal construction and wholesale construction.

Q. What is your definition of piecemeal construction? You just said that the historical development of the Hope Company was piecemeal over a forty-year period?

* * *

554 A. If I recall correctly I stated that some of it was built by piecemeal construction.

Q. Now, I want to get your definition of "piecemeal."

The TRIAL EXAMINER. I believe he testified that piecemeal construction would be more costly than wholesale construction. Is that what you said?

The WITNESS. No; I do not think so. At times it is; yes, sir.

The TRIAL EXAMINER. Well, then, you could not make any distinction so far as costs are concerned, between piecemeal and wholesale construction?

The WITNESS. Yes, I think you can, and if may explain. Hope Company, in its forty years of development, has built the greater part of its pipe lines—I don't recall just what the percentage is. They built—the field lines for instance, most of them are small, short lines, a few miles long, built with small crews of rather skilled pipe line men that the company carries from year to year and does carry them because of their exceptional skill and because they are

exceptionally good men. Those men will build two or three or four-inch lines considerably cheaper than any contractor can
555 afford to move in and build them, largely because of the fact that they have developed a peculiar skill in that direction.

Now, when the large operations come about, requiring large gangs, two or three hundred or five hundred or ten thousand men, they are talking about in this reproduction operation, then the company will go out in the labor market and be satisfied with the average laborer. The average laborer will not do as much work in a day as the man who has been selected and chosen by the Hope Company, and when you are dealing with large pipe lines of large operations, where large numbers of men are required, the cost to anybody will be greater than the cost of building these small lines, like the field lines.

Now, on the other hand, if the company sends a crew of men out, away out in the country, and lays a couple of hundred feet of two inch line, that would be an expensive piecemeal operation.

So, when you are dealing with piecemeal versus wholesale construction in the pipe line business, you can state small, very small, piecemeal construction is expensive. When it gets to an operation that when you carry it with fifteen or twenty men kept busy for a week or two, you get very efficient piecemeal construction, but as the numbers grow larger and more men are required to be
556 picked up in the labor market, then the costs proportionately become more and more extensive, so that on very large construction operations where thousands of men are required, the companies customarily call in contractors who have had a general greater experience in putting together quickly and training large groups of men to work on this work.

So that large work—take for instance your transmission lines work—there is very little difference that would be shown between the company's own costs and our reproduction costs in the aggregate, translated into the same dollars, but when it comes to field lines, where the company uses its own skilled men, the company's costs translated into dollars would be rather less than reproduction costs.

By Mr. Springer:

Q. Do you mean that the company's own skilled men with this particular technique are getting less than 40 cents an hour, that you assumed for men working in gangs for men under your reproduction cost estimate?

A. No.

Q. They are high salaried men, are they not?

A. They are paid on the average higher wages than we assumed would be paid for the average laborer.

Q. And they have not undertaken a construction job on an even small portion of the Hope System once, have they?

557 A. Well, when they had built line H-162 south into Boone County there was a rather sizeable operation that required several hundred men. I have not studied the various detailed operations carried out by Hope, but most of the big lines—any line 12 inches or over, requires such a large gang that if it is a line of say 50 miles or more, generally, the companies would have to dilute its own particularly chosen men with the ordinary average laborer who is available.

Q. Assuming that the prices were the same during the historical development of the Hope Company's system as they are today, the Hope Company having been developed on piecemeal, and your assumption of reproduction costs a three-year wholesale program, would it not cost less—I mean the wholesale program?

A. In the aggregate it would cost a little less than the actual cost to the company in terms of today's dollars.

* * *

558 Q. Is it not acknowledged in the construction field that natural gas pipe line construction at wholesale construction costs are about twenty percent less than piecemeal construction?

A. No.

Q. You have never heard that before?

559 A. I have heard all kinds of statements about what it does and what it does not cost, and I think that my explanation of this morning as to the differences between wholesale and piecemeal construction might explain that.

Q. Do you recall the actual experience of the Hope Company in building H-162 in 1925, which I think is about 100 miles of 20-inch pipe line?

A. No; I do not recall any of the details.

Q. Do you know that the Hope Company built that itself without contracting the construction of it?

A. I believe they did, yes.

The TRIAL EXAMINER: Do you call that piecemeal work or wholesale work?

The WITNESS. That is big enough to be wholesale work.

By Mr. SPRINGER:

Q. Is that not in dollar amount many times larger than the H-192 that was constructed under contract by the Hope Company?

A. It is larger, but I would not say it was many times larger.

Q. H-166 is a 20-inch pipe?

A. That is right.

Q. And the other is 12-inch pipe?

A. That is right.

Q. You spoke of H-162 being, in your opinion, wholesale
560 construction. Will you define the lower limits of wholesale construction?

A. No such definition can be given. It is a gradual transition from a tiny job which would represent piecemeal construction to larger and larger jobs, and ultimately you get a job large enough to require several hundred men on the one job, and that approaches wholesale construction, but in general, the bigger the job the harder it is to get enough men to do a good job.

Q. Is it true, Mr. Rhodes, that contractors are able to assemble large crews for assembly of pipe lines, and to do that which you term wholesale construction, more cheaply than the companies?

A. That is so; yes, sir.

Q. Well, why did you omit leaseholds from your reproduction cost new estimate?

A. Because I was asked to do so.

Q. By the counsel for the Hope Natural Gas Company?

A. Naturally.

Q. Do you think that a reproduction cost new estimate of a production system property is complete without including the reproduction cost-new estimate of the leaseholds?

A. They must be reflected in some form or other in the rate base.

561 Mr. SPRINGER. May I have the question and the answer repeated?

(The record is read.)

By Mr. SPRINGER:

Q. Your answer would be "No," would it not?

A. It is not a reproduction cost of the whole property, that is true, but it is complete as to the property which is constructed.

Q. Mr. Rhodes, you would not reproduce the gas wells and the related equipment if you did not have the leases on which they were placed?

A. That is true, yes.

Q. On page 13 of Exhibit 16–A you state that the assumed construction period for the reproduction cost new estimate is three years. Do you have a working schedule upon which that estimate is based?

A. No.

Q. Don't you know the size of the crews and the amount of the machinery required to reproduce this property under the three-year construction program?

A. It would take about 12,000 or 14,000 men.

Q. How do you know it would take that number?

A. That has been estimated from the amount of work of the various classes required to be done. It is a rough estimate
562 that was made.

Q. That is a judgment figure?

A. No. I did not myself make the estimate, but from the amount of pipe line work to be done and the amount of building construction and the amount of compressor station equipment, it is possible to arrive at approximately the number of men that would be required to build it, without working it out in detail. The number of men would vary from time to time. It would probably take six months before you were going full blast on a construction program of that kind. It might reach the peak in a year and a half, and then gradually in the last six months, it would fall off to relatively few men.

Q. Don't you have a construction program assumed for the purposes of this estimate?

A. Well, for the purposes of the estimate we assumed the property could be constructed in three years, and that is a fair length of time to be consumed in constructing a property of this size and complexity.

Q. Do you know whether you have 100 men, the first day or 1,000 men the first six months, or don't you know when your payrolls are going to enter into the unit cost of development in the case?

A. As I stated before, some 12,000 or 14,000 men would be required during the peak of construction.

563 Q. Do you know the amount of machinery that is going to be required from month to month?

A. The working papers would disclose in some form the approximate number of gangs involved in pipe line equipment, from which the amount of machinery could be figured, but having developed a

unit cost per foot on the different sizes of pipe, it is just a mere incident as to how many men you are going to use in the aggregate, except to know whether it is a few men or many men.

Q. Is it not possible that if you are wrong on your assumption of the number of men, that it may take six years to reproduce this system?

A. We are not wrong on the number of men required to do the work.

Q. But you don't know the exact number from month to month that would be required?

A. If you find your progress is slow on your schedule, you just get more gangs of men at work. In an actual construction program, involving rates of construction approximating this, you do lay out a program of construction, to know when you are going to require your men and when you are going to require your materials, but it may vary from time to time as to the number of men and the gangs, as you find you are slipping behind or
564 getting ahead of your construction program.

Q. But your working papers do show the period of time required to construct each major portion of the Hope system, do they not?

A. No.

Q. How do you figure your interest during construction?

A. The interest during construction as used in this reproduction cost new exhibit was the interest during construction agreed to in the former Cleveland case and used on the Ohio Commission, and I have reconsidered it as to whether or not it fairly represented conditions today, and I think that it is reasonable and proper interest during construction, that is not figured specifically as to progress or anything of the kind. In a three-year construction period of a complex property it would indicate to me that 8 percent is a fair interest during construction.

Q. Have you assumed, Mr. Rhodes, on a three-year period of reproducing the property that not one unit of it would be in commercial operation before the end of that three-year period.

A. No.

Q. What is your construction and operation program for the estimate of the reproduction cost?

A. Some parts of the property could be completed and
565 placed in operation within a year or fifteen months after the beginning of active construction. It would be possible to put some of it in operation. Other parts of the property, for

reasons of economy, it would be necessary to be built well ahead of the time it would actually be placed in operation, to avoid back-tracking and going back to work in a given neighborhood.

If I had adopted the sometimes-used formula of interest during construction that I understand is used by the Interstate Commerce Commission, I would have arrived at a much higher figure than 8 percent. That formula calls for interest for half of the construction period plus three months. In other words there would be twenty-one months use of the money, if I had followed the Interstate Commerce Commission formula for interest during construction period. If you take 8 percent as the cost of money, that would mean a 14 percent interest during construction. I have used 8 percent.

Q. And you employed the principle that when a unit of property is available for use, interest and taxes on that cease?

A. Not when it is available for use, but when conditions will permit it to be used. A piece of property may be completed months before it would be possible to connect it into the system and actually use it in operation.

566 Q. Have you employed the principle in your reproduction cost estimate of which I spoke?

A. Not by specific application.

Q. You say that you took the figure that was agreed to in 1931 in the Cleveland rate case, is that what you said?

A. That was the start, yes.

Q. But you were also aware that the figure was not agreed to in the 1937 Cleveland rate case.

A. That is correct.

Q. Do you have any outline of your construction program that would reveal the number of men, the amount of machinery required, the dates of cutting into operation of the various units of the property which you described?

A. No.

Q. On page 14 of Exhibit 16-A you state that you used labor rates and material prices prevailing during the winter of 1938-1939?

A. That is right.

Q. I suppose your reproduction cost new estimate is based on spot prices?

A. No, it is not.

Q. Have you used material prices and labor rates that have been averaged over the last five years or the last three years?

567 A. The prices I used are prices that have remained substantially the same from the Fall of 1938 up to the present time. There is a tendency upward in prices at the present time.

Q. How do you know that, Mr. Rhodes? What is the basis for your statement. Do you have indexes?

A. Various indices are available. I note, for instance, that there has been no change in the price pipe, casing and tubing, which are the dominant materials, the principal materials entering into the construction. I know that there are no appreciable changes in the cost of compressor station machinery.

Q. Have you available in your working papers the prices for pipe annually from 1925 to date, and would you read those into the record?

A. No, the working papers are all based on unit prices for certain sizes of pipe, and I know from the prices that are being paid by purchasers of pipe that throughout 1938 and 1939 they have been substantially unchanged.

Q. Could you name the sales of pipe to which you refer?

A. I investigated the prices for approximately $3,000,000 worth of pipe, casing and tubing that was purchased in the latter half of 1938 and the first half of 1939, and in some cases the latter
568 half of 1939, and found that the prices that were actually paid for the pipe at the factory were somewhat higher than the unit prices at which I priced the inventory in the price inventory of this report.

Q. How many million dollars worth of pipe would be required to reproduce the Hope system?

A. About ten or twelve million of pipe, and casing and tubing approximately the same amount. Those are rough figures.

Q. And to price twenty million dollars worth of pipe to reproduce the Hope system, you referred to prices during the winter of 1938 and 1939?

A. And the latter part of 1939.

Q. But you did not make an average price, you say, over the last five or six years?

A. That was made in the working papers of some other estimates of reproduction cost new, and I do not recall at the moment when all of the prices of pipe changed, but there was a peak of prices in 1937 and the first part of 1938. Before that the prices, for a year or two, were approximately the same as they now are, and of course earlier than that, in the periods of extreme industrial depression, the prices of pipe were even lower.

Q. Can you give us the pipe prices?

A. I could look up the prices for pipe in these various
569 reproduction cost new estimates I have made. I do not have them at hand.

Q. Are those the prices actually paid for pipe, or your estimates?

A. The prices to which I refer were the prices quoted to me by the manufacturers of pipe, which prices are the prices that I found were actually paid by the purchasers of three million dollars worth of pipe in 1938 and 1939. The task of making comparisons is so great that I did not attempt to cover all of the purchases that I might have studied, had time been available, but they reflected far more than three million dollars worth of pipe.

Q. That was not one purchase, these three million dollars?

A. Oh, no; it was purchased by one group of pipe-using companies.

Q. We would still like to know, Mr. Rhodes, what the source of your price of pipe information is?

A. Well, the first source of pipe information was the pipe mills who were requested to give us the prices of large numbers of sizes and kinds of pipe, casing and tubing entering into this property. They were asked to give us their lowest prices, having in mind the quantities involved.

We started with those prices. We made an investigation, and I think personally I had an investigation made to find
570 out whether those prices were actually being paid for pipe, and I found that the group of properties, of which this is one, bought—I think it was three or four hundred thousand tons of pipe or casing in 1938 and 1939.

I had a considerable portion of this pipe examined as to price and found that this three million dollars worth of pipe and casing and tubing as a sample of the three hundred thousand tons, which was twenty million dollars, more or less—I found that on the average the price paid was greater than the prices that I had used for pricing the various sizes of pipe in the inventories.

Q. Did the prices you assumed take into consideration the discounts available on carload lots?

A. The prices that I have used in pricing the inventories took into account all discounts that the manufacturers acknowledged. They were based on purchases of carload lots into, I might say, trainload lots of pipe. I did find that in certain cases still further discounts were obtainable, under certain conditions, and that was reflected in this reproduction cost new by a lump sum reduction in

the total cost of the pipe lines beyond the unit prices that had been quoted to me by the manufacturers.

Q. How much was that lump sum deduction?

A. Roughly a million and a half dollars.

Q. And in percentage?

571 A. Ten per cent of the mill price.

Q. That was for pipe lines only and not for pipe tubing and casings?

A. There are no discounts available for casing and tubing other than those which are quoted to us by the manufacturers.

Q. And do you have the prices used for tubing and casing before you?

A. Not on my desk. They are available in the working papers. The unit price, including freight, and so forth, are of course available in the price inventory, but the mill prices are not in convenient form.

Q. Do you remember the basing discounts and all the other discounts for tubing and casing?

A. The only discount for tubing and casing that was quoted to us was the 2 per cent for cash. The prices given in general covered all of the equipment of a well, which is the way the casing and tubing is customarily sold.

Q. Are you aware of the fact that the jobbers get a ten and a five per cent discount in addition to that?

A. I don't know what the jobbers get, but I do know what the producers have to pay for the pipe.

Q. Don't the purchasers get a basing discount?

A. The purchasers buy all of their casing and tubing
572 at the manufacturers' quoted prices less two per cent for cash. There are very few, if any, exceptions to that, that I have been able to find.

Q. You don't know of any large quantity of purchased pipe, where there is no more than a 2 per cent cash discount?

A. Casing and tubing is not purchased in large quantities, as a general thing. The manufacturers of oil-well tubular goods maintain warehouses about the country and they maintain agents and the prices paid by the purchaser are the same whether they are bought directly from the mill or through the agents.

Q. Is there any difference in the manufacture of casing and tubing and line pipe?

A. Yes, the casing and tubing is manufactured with much more regard to rigorous specifications as regards flaws, quality of workmanship, and so forth.

Q. You have assumed in this three-year construction program for your estimate of reproduction cost new, that you would have purchased all of the tubing and casing required within the three year period?

A. Yes.

Q. But you have not taken advantage of any large lot purchase discounts?

A. There are none to be had.

573 Q. When you sought quotations from the manufacturers on the prices of pipe and tubing and casing, the manufacturers knew that it was for appraisal and rate case purposes, did they not?

A. I think so; yes.

Q. Do you know of any actual negotiations for the purchase of pipe, tubing and casing, that are comparable to the requirements of reproduce the Hope system?

A. Not in recent years.

Q. Do you know of any?

A. I have heard of none.

Q. Does the Hope Company have the advantage of the purchasing services of the Standard Oil Company of New Jersey?

A. If they asked for it.

Q. They have used that service, have they not?

A. I have not investigated to what extent they have used it, but I understand that they did, from time to time.

Q. Do you know what discounts the Hope Company has received on the purchase of large quantities of pipe?

A. I don't know what prices they paid for pipe, except in 1938 or 1939, and find that the prices they have been paying, as in common with all the other properties owned by Standard or affiliated with Standard, are the prices that we used for pricing the priced inventory before the one and a half million

574 dollar discount for large purchases.

Q. Do you know the price paid for pipe used in the H-192?

A. No, I do not.

Q. On page 14 of your Exhibit 16-A, you state: "Since that time"—that is 1938-1939—"the level of these rates and prices has remained substantially the same."

By what means are you able to determine that?

A. Well, as to pipe, casing and tubing, which are the principal materials, I find that the fact is actually so as reflected by the

purchases of this group of companies. I also know from the price indices which we have—we keep up certain price indices in our office—we have available purchase price indices prepared by other people, and they show that, for construction such as that involved in the natural gas properties, the overall price level has been substantially the same throughout the period from the middle of 1938 up to the end of 1939.

Q. Would it not be a coincidence if the estimates which you give for the Hope system today was the same answer you give in your Exhibit 16–A which is as of December 31, 1938?

A. Today there is a tendency upwards of prices. What is going to happen depends entirely upon what happens in Europe.

575 Q. Would it not be a coincidence if the cost of reproduction new estimate in any new natural gas property were the same on dates varying by six months?

A. No. This reproduction cost new estimate covers a period of substantially eighteen months during which there is no substantial change in the prices.

Q. You say "substantial change." I say it would be a coincidence if the answer were the same if you made a reproduction cost estimate six months apart on the same system?

A. If it were the same to a dollar, it would be a miracle.

Q. On page 14, you state that the company would purchase all materials except the building materials. What company do you refer to?

A. The company capitalized in this exhibit refers to the Hope Natural Gas Company.

Q. Have you considered the discounts available on quantity purchases made by the Standard Oil Company of New Jersey?

A. Yes; the ten percent on pipe, for instance, was based on information obtained from the Purchasing Department.

Q. Did you secure bids from responsible contractors on a competitive basis, indicating what it would cost to install the major units of the property?

576 A. No.

Q. Who wrote the letters to the manufacturers requesting the sales prices on the materials and equipment?

A. Letters were form letters, substantially alike, and of the same tenor, and I participated in their preparation.

Q. Was the letterhead that of Ford, Bacon & Davis, the Hope Natural Gas Company or the Standard Oil Company of New Jersey?

A. The Hope Natural Gas Company, as I recall. It is so long since that my recollection may need refreshing, but I think it was the Hope Natural Gas Company.

Q. Were payments made for the quotations which were furnished?

A. In some instances we were asked to compensate for the trouble which the manufacturer went to in furnishing these prices.

Q. And as you have said, the manufacturer knew it was a quotation without the probability of making a sale?

A. That is true, but they were asked to furnish us the lowest price at which they were currently selling things.

Q. Were they practically subject to negotiation, as you and I know it?

A. Well, I found purchases of some hundreds of thousands of tons of pipe, casing and tubing that were purchased by this group of companies in 1938 and 1939 that were purchased
577 at the prices that the manufacturers quoted us.

Q. Could you give us the names of those companies?

A. The full tonnage of pipe refers to the natural gas and oil pipeline companies, in which the Standard Oil of New Jersey has an important interest, so that the materials are from time to time purchased through their own purchasing department. That group of properties includes the Appalachian group here, the Hope Natural Gas Company, East Ohio Gas Company, People's Natural Gas Company, the New York State Natural Gas Company, and the Reserve Company before it was dissolved or merged into the Hope Company. It also includes the Standard Oil Company of Louisiana, which operates a very extensive pipe line system in Louisiana, the Oklahoma Pipe Line Company in Oklahoma, the Ajax Pipe Line Company from Oklahoma to St. Louis, the Humble Pipe Line Company, which operates in Texas, the Humble Oil and Refining Company, the Tuscarora Pipe Line Company, which is a gasoline pipe line running east to the Atlantic Seaboard. Those are the principal properties.

Q. Do the prices which you used in this valuation reflect prices that would be available from the quantity purchases required for the distribution plant of the Hope Natural Gas Company, East Ohio, and the People's distribution system included?

A. Do I understand correctly that you are referring to this entire Appalachian group of properties in its entirety?

578 Q. That is correct.

A. I am afraid that if that number of properties were to be built within a period of a few years, the price of pipe would advance materially instead of there being discounts.

Q. Why?

A. Because there would be so much business to go around that the manufacturers would advance their prices.

Q. Do you mean that they would violate the law?

A. No; they would ask for more money for their product if they could get a fair share of the business. How they may go about it, I do not know, but I feel sure that there would be an increase in the price of pipe, casing and tubing, if purchases would be thrown on the market equal to the entire requirements of this group of companies.

Q. You assumed that the Hope Company would be reproduced in three years. Do your pipe prices reflect your conception of a hypothetical increase under such an assumption?

A. They assumed the continuation of the conditions that have existed since about the middle of 1938 up to the end of 1939.

Q. On page 14 of Exhibit 16–A you state that where equipment was no longer being manufactured as specified, the cost of superseding equipment at lowest quoted prices of competent manufacturers were used as a basis of pricing. Will you
579 please list the location of equipment where you used prices of that character?

A. In the gas engine driven compressor portion of the Hastings station, there are four large compressor engines of the type and character that are no longer available except to be made to order. The patters are not available, and prices quoted on equipment of that kind that has not been made for years are not representative of the present-day prices of equipment. As related to those particular engines, we priced them on a per-horsepower basis, equal to the price per horsepower of the largest gas-engine-driven compressor unit, single tandem, as these engines are, which is now currently being offered in the market.

Q. Would you complete your list of equipment where substitute equipment is priced?

A. I would not call it substitute equipment; I am merely pricing a price per horsepower that would be paid if one wanted to put in the largest commercially available unit today. In the other cases, the Company has a considerable number, fifteen or twenty smaller engines of the same general types of such engines. They are of a type that have not been made—they

are called Snow engines—and they have not been made by the successor of the Snow Company, namely the Worthington, for a number of years. They are very similar, however, to en-
580 gines that are being offered today both by Worthington and by Cooper-Bessemer, the two principal manufacturers of large gas engines. We found the Cooper-Bessemer prices for that size engine were lower than the Worthington prices, so I took the Cooper-Bessemer prices which were in line with the prices at which Cooper-Bessemer is actually selling such equipment.

Q. Is that a full listing of equipment which is no longer manufactured, and which you secured their prices for?

A. That is two important items. The Company also owns a considerable number of center crank single tandem engines made by the National Transit Company. They were priced as though they were the standard single standard engines, with the side crank. Those particular items cover the greater part of the equipment that is not now manufactured.

Another type which is not so plentiful is long-stroke 48-inch stroke Westinghouse engine—the Westinghouse Company is no longer in the business of building gas engines, so we priced those engines at the cost per horsepower of the engines that had the nearest comparable dimensions ast o bore and stroke which primarily control horsepower.

Q. Are the engines at the Hastings plant still manufactured by Westinghouse?

A. They are no longer like those.

Q. On equipment which is no longer being manufac-
581 tured, and is at the present time obsolete, did your price quotations represent the cost of a comparable unit on the basis of performance abilities or on substitute equipment?

A. There is no equipment of any importance on this property that is obsolete to the extent that it will be retired by obsolescence. So actually, I should say that the answer to your question is "No," there being no obsolete equipment.

Q. Did you price equipment with comparable performance ability?

A. I priced the equipment, as I stated before, with the lowest prices quoted by the manufacturers of equipment as nearly like this in question as we were able to get the prices on.

Q. Did you make the test of performance? Are not the new machines more efficient than the old machines?

A. As to gas engines, not particularly.

Q. How about turbines?

A. Under the operating conditions of these turbines, which is a relatively low pressure turbine, and relatively low vacuum, I should say that with the water in that country and the other efficiency factors, the efficiency of the turbines today is not appreciably different from that which obtained at the time those turbines were built.

Q. On page 12 and 21, you state that wrought-iron pipe was priced as steel pipe. Will you tell us the quantity and the
582 location of pipe which you know to be wrought-iron and which has been priced as steel pipe?

A. All pipe bought before 1900 must necessarily be wrought-iron pipe, because steel pipe was not available on the market. The pipe bought between 1900 and 1908 or 1909, some was of one kind and some was another. Having no intention of replacing wrought-iron pipe as such, I made no investigation as to exactly how much of it there was.

Q. You do not know the quantity nor the location of the wrought iron pipe in the Hope System?

A. I made no investigation.

Q. On page 15 of Exhibit 16-A you also discuss the freight rates. Would the freight rates that you used be weighted average freight rates, giving effect to quantity and tonnage for the materials, based on their actual destination?

A. Carload freight rates were used throughout. I believe that answers one of your questions, because that is the lowest freight rates which are available. Second, knowing that we might use the same prices for the same identical machines and materials as to different locations, we used freight rates from the mill to the weighted average destination of the particular type of equipment involved.

Q. Where did you assume the property would be shipped?

A. Lorrain or McKeesport or other parts of the Pitts-
583 burgh district—Youngstown. Nothing specific.

Q. You had no schedule of purchases and routing?

A. That is correct.

Q. Did you have a central destination point or did you have geographical area destination points for the Hope System?

A. We used the freight rates weighted to—what you might call the weighted average destination for pipe, and that freight rate is substantially the same for many of the pipe mills in the Pittsburgh district.

Q. Will you tell us how you computed the weighted average?

A. The exact form in which the calculations were made, I do not recall, but the natural way would be to find approximately the amount of pipe that went to each point of receipt, and weighting the freight rates to those points pro rate to the tonnage that went to those points.

Q. Do your working papers reveal the detail of that?

A. They will reveal it in some form, yes.

* * *

584 Q. On page 16 of your Exhibit 16-A, you state that in the price inventory there are no allowances for contingencies and omissions other than those included in the unit costs. What contingencies and omissions have you included in the unit costs which you applied to materials and machinery equipment, the inventories for which were taken from the investment
585 ledgers?

A. The inventories from all sources or from any source, you might want to consider, are generally incomplete. We priced the pipe lines, for instance, on the number of feet that we found were contained in the finished pipe lines. We merely used the investment ledgers or the records of the length of pipe in the investment ledgers, as a guide in reaching our final inventory. Pipe is used for odds and ends, pipe is damaged, lost or cracked off, when you figure on the basis of the completed line. Our inventory of valves and fittings, for instance, was made by a practical field survey of the valves and the fittings in use. We did not take the tremendously long list of valves contained in the investment ledgers, for instance; we took the list of valves we could find and could find were being used. It would not be complete in any reasonable time.

The same was true of dresser couplings. We took those on the basis of 20 foot spacing. Obviously, to anyone skilled in the business, 20 feet is rather a liberal spacing, although a customary spacing for dresser couplings.

The incompleteness of the inventory as to these details is taken care of in a miscellaneous materials cost allowance.

On the cost of laying pipe lines, it would be seen by an examination of our working papers, we started out with
586 unhampered performances under perfect conditions, everything running perfectly, no trouble from the rain, no labor trouble. We assumed that the men could start off bang at full

efficiency in running a gang of a few hundred men, which we know cannot be done.

We made an allowance in the unit cost for laying pipe lines, covering what we deemed to be the effects of the weather and the moving around from place to place of various gangs, and the lost motion of that nature.

These unit costs are the only places in reproduction cost new where there is any allowance for things of that kind.

Q. Can you tell us in dollar amount what the contingencies and omissions would equal?

A. I have not figured it out.

Q. Do you know what percentage was inserted for the contingencies and the omissions?

A. The percentage was different in the case of different unit costs, and we would have to refer to the working papers to determine that. I may have some excerpts from the working papers in that connection.

Q. Will the development of your unit costs show those details?

A. Yes; the development of the unit costs will show with respect to laying pipe lines specifically what percentage
587 allowances were made for contingencies. The development of the unit costs will also show the amount of these material costs, not only for contingencies in the nature of material contingencies, but for the cost of purchasing, and things of that nature.

The general unit costs for things of the nature of building construction will show the contingencies. The performances that we have used are performances that might reasonably be expected. They are not affected quite as much, for instance, by weather, as the cost of laying pipe lines.

Q. Is your treatment of omissions and contingencies in the unit costs in your estimate related to the actual experience of the Hope Company?

A. It could not be related to the Hope's experience. The amount to be allowed for omissions and contingencies is necessarily affected by the amount you include in your basic figures. If you are able to develop, or have the time to go to the expense of developing your basic figures completely enough, the omission and contingencies can be made very small. If your basic figures are relatively rough, the allowance for omissions and contingencies must be larger. The allowances that we have made, in our

opinion and judgment, properly reflect what is in the principal direct costs, and what additional amounts should be allowed to adequately reflect the whole cost of the project.

588 Q. In your Exhibit 16–A, page 16, you state that the development of unit costs is available in convenient form. Is that a volume or a series of volumes of working papers?

A. At the present time it is a stack of papers as high as that table [indicating] in which there are literally hundreds of developments.

Q. Do you have a copy of those?

A. There is only the one copy of the whole. Some of it has been copied.

* * *

594 Q. Mr. Rhodes, is this reproduction cost new estimate set up in accordance with the 1939 West Virginia Uniform System of Accounts for Gas Utilities, which is Exhibit 13 in this case?

A. The classification of the inventory contained in here is that which was given to me or my men by the company's accounting department as having been so set up. I find from going through these myself that there are some details which might be in a
595 different account from what they are, but it is substantially correct as I see it.

Q. Are there any differences between your classification of pipe lines and compressor stations, and that of Mr. Tonkins, as shown on Exhibit 1?

A. I have not made a comparison of the two groups. As I stated before, the groupings of the inventory were made by the accounting department of the company, and the breakdown, as between the production system pipe lines and the transmission system main lines is that of the company.

* * *

Q. Have you, in preparing your reproduction cost new estimates followed the instructions as to the costs properly includable in the plant accounts prescribed in the West Virginia Public Service Commission Uniform System of Accounts for Gas Utilities, 1939?

A. In determining this reproduction cost new, I deter-
596 mined what it would cost to build the property. The detailed classification as to this, that, and the other thing, I paid no attention to. While I am generally familiar with what is properly includable in the Code of Accounts, I have

everything in here that is properly includable, and nothing but what the company would be called upon to spend money in the case of a reproduction of the property.

Q. Can you segregate for each of the structures, improvement and equipment accounts, as shown in your reproduction cost new estimate, the amounts included and described as components of construction cost on pages 51 and 52 of the West Virginia Public Service Uniform System of Accounts for 1939?

A. That could be done at the expenditure of a good deal of time and effort. The determination of the unit cost was not made for the purpose of facilitating such a breakdown, but rather for the purpose of facilitating the determination of reproduction cost new. We have made no breakdown which would permit the breaking down of those costs into eighteen different classifications of things that comprise the construction costs.

Q. Then you are unable to give us the total number of dollars in your reproduction cost new estimate which is described
597 in the West Virginia system of accounts as contract work?

A. I could, but not without going to considerable trouble and expense.

Q. And that is true of all of the other classifications of the components of construction costs in that system of accounts?

A. That is true.

* * *

Q. Mr. Rhodes, on page 11 of Exhibit 16–A, you stated that the items of property covered by this reproduction cost estimate are classified by the company in accordance with the new Uniform System of Accounts for Gas Utilities, prescribed by the Public Service Commission of West Virginia effective January 1, 1939. Do you know who, in the employ of the Hope Natural Gas Company made that classification?

A. Well, the classification on questions that appeared to our men as requiring an answer were in general referred to Mr. Cross, one of Mr. Chisler's principal assistants.

Q. Is Mr. Cross an accountant or an engineer?

598 A. He is an accountant.

Q. Does not his classification differ from Mr. Tokin's for pipe lines?

A. Mr. Tonkin's classification, as I followed it, is the practical classification of the operating man. The classification in the Code of Accounts is intended to be an accounting classification.

and I think there are many lines where it would not be clear as to in which category they belonged.

Q. Mr. Rhodes, on page 17 of Exhibit 16–A you state that in pricing the inventory of the buildings and structures you used appropriate costs per cubic foot. Did you price the quantities and materials entering into the individual structures being priced?

A. In the case of the larger buildings, considerable portion of which are compressor station structures, while the priced inventory shows the costs as a cost per cubic foot, a reference to the working papers of the unit cost development will show that the total cost of each particular building was determined by pricing all of the classes of work entering into it and then the cost per cubic foot determined and transferred to the price inventory, to avoid the complication detailed in pricing.

Now, as to the buildings of moderate size, for instance, they were divided into groups by types of construction, and
599 typical buildings of each group were priced in complete detail, as is shown in the working papers, and buildings of other dimensions than those specified buildings were priced at prices per cubic foot that fairly reflects the difference in the cost as between the different sizes of buildings.

The very small buildings, like meter houses or meter boxes, those were divided into appropriate groups of buildings of substantially the same size and dimensions, and they were priced on the basis of an average unit. There are several hundred buildings in some cases that are substantially alike.

Q. Could you tell us what proportion of the building and structures were actually inventoried, in order to price them on the group basis you have described?

A. I do not have available the proportion, but a considerable portion of the total dollar value was priced in detail, I know that.

Q. But that which was not actually inventoried has been priced on an approximate group basis?

A. Well, all buildings, except the little box-like structures, are priced at a price per cubic foot that reflects the particular size and type of building involved. Each particular type of building would involve pricing in complete detail of all of the work entering into the construction of several buildings of that group.

600 Q. Do the books and records of the Hope Company reveal the quantity of materials bought by the company which entered into the construction of these buildings?

A. Only to a limited extent.

Q. How did you determine the kind or the amount of material in each structure?

A. Each structure had previously been inventoried as of 1931 in complete detail. The inventories were agreed upon by the representatives of the City of Cleveland and of the Company and of the Ohio Commission as being fair inventories of all of the buildings that were then owned by the Company. Some of those buildings had disappeared and others had been changed, all of which facts were ascertained in the field.

Now, as to a great many of these buildings, a recheck of all of the details was made, to truthfully determine for me as to whether I could reasonably accept the agreement, with which I had previously nothing to do as an individual, and I found that these old agreed-upon inventories in the aggregate, detailed as they were, were satisfactory for the purpose of pricing these buildings. Many of the buildings, in fact, practically all of the buildings that we priced in detail were rechecked in complete detail. The other buildings we did not question in detail. We had the description and the dimensions which were accepted and
601 found to be correct, but no complete detailed remeasurement was made of buildings found to be unchanged, other than a few, so really it is a considerable number which were taken in absolutely and which we rechecked in complete detail.

Q. Then you used the group basis of pricing?

A. That is right.

Q. Referring to page 18 of Exhibit 16-A, on gas well construction, did you make a study of the Hope Company's experience as to the cost of drilling wells?

A. We made a study of their experience over a period of years, and tried to coordinate the speed of drilling with the character of rock through which they were drilling, and found that there were so many indefinitenesses about the company's records that we could not use them dependably.

In general, the time spent to drill wells as shown by the company's records, where they had complete records, was greater than the time that we felt should be required to drill these wells. For this reason we made a complete study of other people's experiences in drilling of wells, and have based our pricing on what you might say is the typical average experience in West Virginia.

Q. Could you name the other properties which you studied to get that typical average price?

A. I would have to look up the records, but I can say
602 this, that every contractor of any size, doing work for the company or for any other gas companies, was interviewed as to the length of time required to drill wells in this territory and as to the equipment that he used, and as to his methods, that information was also compared with records of similar performance of wells drilled by the other gas companies that were operating in immediately contiguous territory, and based on that investigation, we determined just what would be required in the nature of equipment, and we found an average number of days that would be required to drill the wells of the company, based on the experience of all of these contractors, and we found their experiences with respect to depreciation and wear and tear and the wearing out of well-drilling equipment, such for instance as the cables and lines and tools used, and put together all of these factors which are primarily non-company experience, arriving at a figure which would be considerably less than would have been arrived at had we based our cost on the company's own drilling experience over a number of years.

Q. When we reach the discussion of specific costs, you will be able to reveal the exact components in the making up of those costs and give them to us?

A. The working papers show the costs in great detail; yes.

603 Q. You say that the unit costs used in arriving at the costs, are contract costs? Did you secure competitive bids from responsible contractors?

A. No.

Q. How did you determine the contract cost?

A. We did not attempt to fool the contractors into making bids for wells. That would not have been a proper procedure. We confended ourselves with finding out what the contractor's experiences were. We put together their most favorable experiences rather than their bad experiences as reflected by some of the company's records, by figuring it as a contract cost; the meaning of that is related to the fact that we have in there an allowance for contractor's fee and contractor's overhead.

Q. Do you remember the percentage that you allowed for contractor's profit?

A. There was an allowance of ten percent, out of which the contractor would have to pay his taxes, gross earnings tax in West Virginia, pay for his general overheads, and insurance against abnormal risks, which occur from time to time, in something that

goes wrong in the drilling of wells, in fishing expeditions, and the time required to get tools out when they drop to the bottom of the well. How much would be left for profit, I do not
604 know, but the contractor would do well if he had 5 percent.

Q. Did you consult any of the other companies in the Appalachian area on their drilling costs?

A. We consulted others in this district where the costs are rather lower than in some of the other Appalachian districts. We did not directly reflect some of the low costs of drilling wells, because we find that some of the contractors, instead of paying the current going wages, were getting men to work twelve hours a day with not a proportionate increase in the pay. Of course, low cost prices can be achieved by such a method. We could not assume any such method in this reproduction cost, because it was being done contrary to the law as to the Wages and Hours Act, and we therefore ignored a few of the low-priced drilling costs that some contractors were offering.

Q. Did you inquire into the well-construction costs of the United Fuel Gas Company?

A. Without reference to the details, I would not care to say.

Q. Your papers would reveal that?

A. The papers would reveal those whom we saw and what we found out.

Q. Do you know what portion of Hope Company's wells were purchased?

605 A. Not offhand; no, sir. I believe it is in the record already.

Q. Is it a small portion?

A. I don't recall. I think it is a minor fraction, but just what it is I do not know.

Q. How did you determine the weight of casing and tubing in the wells which were purchased by the Hope Company?

A. There was no record available in most cases as to the weight of casing and tubing. The size is available, and when we did not know the weight, we had to price the particular casing and tubing at the average weight of the casing and tubing that had been purchased by the company. There are some cases where the wells that had the casing and tubing pulled where that information was available, but in general, where we did not know the weight, we took it at the average weight of the company's purchases.

Q. How did you determine the weight of the casing and tubing in the wells which contained the second-hand or used casing and tubing?

A. Most of the wells containing used casing or tubing was casing or tubing which was put in from the company's own stocks and was accordingly purchased company's casing and tubing. Where there was no record of what was in a particular well, we had to rely on the general proportions of the
606 company's purchases of the different weights, and which we analyzed in considerable detail.

Q. Your reproduced wells which contained originally used casing and tubing had an average price for new pipe purchased for the Hope Company, is that right?

A. We made no differentiation as to where the tubing and casing came from.

Q. Is it true that wells in the different regions of West Virginia, although having the same depths, will have different costs?

A. They may have; yes.

Q. Is it generally true that the average costs per foot of deep wells is more than that of shallow wells?

A. In the broad way, yes; but as compared with wells within reasonable limits in any territory, the price per foot is generally the same. Compared with 1,500-foot wells, 3,000-foot wells should cost more per foot.

Q. In your opinion, the average cost per foot of drilling a 5,000-foot well would be greater than the cost of drilling a 1,000-foot well?

A. In general; yes.

Q. And is it not a fact that the Hope Company has wells varying in depth from less than 1,000 feet to approximately 5,000 feet?

607 A. Yes; a few.

Q. And do you know whether the wells of the Hope Company now in use were drilled, a large number, at one time, or drilled over a number of years?

A. They were drilled over a number of years.

Q. In your experience, do you know of a case where a construction program was undertaken involving the drilling of 3,000 gas wells within three years?

A. No; but I know of cases where drilling of more oil wells was carried out in that period of time.

Q. By one company?

A. No; by several companies.

Q. Page 18 in your construction cost of gas wells at $2.43 per foot, do you include the cost arising from the use of drilling equipment?

A. I do not see the reference to the price. I do not think it is mentioned there.

Q. As a matter of principle did you, in your construction cost of gas wells add x dollars per foot as the cost arising from the use of drilling equipment?

A. Yes.

Q. And the details of that computation would be available in the working papers?

A. That is correct.

608 Q. On page 5 of Exhibit 16–C and also referring to page 18 of Exhibit 16–A, you state that a field inventory was made of the closing-in valves and fittings of about ten percent of the wells in each district, and that office records were checked on ten percent of the wells in each district of packers and other details. Then your selection of the ten percent was based on a geographical selection of wells instead of ten percent of the wells classified by the number of producing strings?

A. I don't recall the exact number of wells of each type, but this ten percent sampling was designed to arrive at the typical bill of materials entering into this miscellaneous equipment for wells of the several numbers of producing strings. Whether the exact ten percent applied to all, I don't know. Obviously it did not in the case of the two wells with five producing strings.

Q. And then on page 5 of Exhibit 16–C the inventory of closing-in-equipment which you priced, was not an actual field inventory, but the inventory resulting from the sampling of ten percent of the wells which were checked in the field, is that right?

A. The unit price came from sampling the number of wells of each particular number of producing strings, however, was determined by reference to the actual records of the

609 detailed equipment going into the wells.

Q. Of ten percent?

A. No. All of the wells of the number of each particular class was studied from the records. The unit cost, however, was based on the detailed pricing on an inventory of the detail material such as nipples, T's, check-valves, and so forth, which was based on the ten percent sampling.

Q. The source of the data you used as the inventory of miscellaneous equipment on page 5 of Exhibit 16–C was that office records or field records?

A. It was based on the office records in the operating department. There is no way of seeing what is down in the wells; it is necessary to refer to the records of the department, either the accounting department or preferably the producing department where they have records of almost everything that is in the wells.

Q. Did those records show inventory and miscellaneous equipment of the other gas wells?

A. To the extent that it was known. Naturally, wells that have been purchased, have not been disturbed, and the knowledge was incomplete as to what was beneath the ground.

Q. Referring to page 18 of Exhibit 16–A you indicate that the inventory for quantity of casing and tubing of the wells was prepared by correlating the investment and other
610 records. Did you adopt the investment records of the company for quantities in this case?

A. Correlating of the two records was made and in the case of most of the wells the agreement was substantially perfect. In some of the wells we found a disagreement as between the two records, in which case every possible source of information was checked to determine which was correct. There are some wells, for instance, where we found more tubing in the wells than could physically exist there. That was corrected for, and the correlation of these two sources indicated those particular wells where we needed to make further investigation, and the best source of information as related to each individual well was finally adopted and the records were corrected.

Q. What were the two sources?

A. The two basic sources are the accounting department records of what was charged out to the well, and the records of the producing department, as to what was in the well. They might be compared also to the records at the time of drilling the well which shows the amount of casing and tubing sent out to the well and the amount left in the well. All sources of that kind were examined, and as I said, wherever there was a discrepancy in the sources, the best possible investigation was made to correct it.

611 Q. And then you adopted the book records; both sources being book records?

A. Well, of course, the only possible record is something on a piece of paper, because obviously you could not pull casing or tubing from a well and measure it. It was necessary to adopt

book records, but as I have pointed out, there were different sources different departments, from which records may be obtained for the purpose of reconciling differences.

Q. How did you determine which one to take?

A. The records of each particular well were studied in detail when there was a disagreement and a conclusion was reached in conjunction with the operating people and with me as to the well, as to what was the most reliable source of information with respect to any particular well in trouble. Generally, there was little difficulty in reconciling the differences.

Q. Do the records you speak about show the weight and kind of tubing and casing in the wells of the company?

A. They show the kind and size and only in some instances do they show the weight.

Q. How did you test it to determine whether the pipe in your analysis of the Hope Company's purchase vouchers was the same as the pipe now being used in the Hope System?

612 A. Practically all of the pipe that Hope has bought is still in its wells—certainly a large portion of it is. We ascertained by an analysis of the purchase vouchers for the greater part of what they had bought that there were certain weights of each particular kind and size in certain proportions. Being unable to find out exactly what existed in each and every well, we necessarily had to take the proportions of casing of the different weights as actually purchased by the company, for the purpose of this reproduction cost new. There was no other reasonable alternative.

Q. Then you did not know which wells contained used tubing and casing and what portions had been retired.

A. No; as to each well, we have no knowledge of what was new when it was put in, and what had been previously used by the company.

Q. Is it true that the weight in pounds per foot of casing and tubing is an important matter in determining this cost per foot?

A. Indeed it is.

Q. Then for example on page 4 of Exhibit 16–C, if all the two inch cashing were four pounds per foot instead of five pounds per foot your estimate would be approximately twenty percent of $200,000, in excess of the actual, would it not?

A. There are no figures on page 4 that would indicate
613 such to be the case.

Q. Do you see column 4? "Pounds per foot" on page 4, Exhibit 16–C?

A. Yes.

Q. You use five pounds, and if the five-pound pipe were four pounds, then referring to column 7, the total cost would be twenty percent less, or $200,000.

A. But the company did not purchase enough four-pound pipe so that that would be impossible.

Q. That is an example. We might run through the whole computation.

You said that you did not know what tubing and casing was in the company's wells, whether it was used, new, or portions of it had been retired, nor did you know the weight?

A. As to any individual weight that is correct; yes, sir.

Q. On page 4 of Exhibit 16–C, if all of the 6⅝ths inch casing were 17 pounds instead of 20 pounds, the difference would amount to approximately $455,000 on a similar computation.

* * *

614 The WITNESS. That is correct.

By Mr. SPRINGER:

Q. Then the pipe weights which you have used are based upon your own study, without relation to the facts in the case, and another engineer might prepare a similar study and reach different conclusions?

A. As to the first question, I prepared my study based on the facts in the case as to what weights of casing and tubing of the different sizes the company had purchased in its history, which is a very good indication of what remains. What another engineer would do, of course, I do not know.

Q. But did you say that you analyzed only a percentage of the pipe purchased?

A. We analyzed practically all of the pipe and casing purchased by the company over its history—the oil well pipe casing.

Q. But you did not make an analysis of the pipe, casing, and tubing in the gas wells purchased, did you?

A. No; that was taken to be the same weight on the average as the wells in which the company placed the tubing itself.

Q. Mr. Rhodes, you are aware of how the Hope Company runs its warehouse, are you not? I mean by that, that they buy large quantities of pipe and that may be transferred to

615 the Hope Construction and Refining Company, and may never get into the Hope system?

A. That may be; yes, sir.

Q. If there are any errors in such a transaction, that is reflected in your reproduction cost new estimate, is it not?

A. No reason to expect any errors. The wells are all substantially the same depths and built by the same people, they would be likely to have the same weights of casing and tubing from year to year as the needs of the situation changed.

Q. But you do not know that to be a fact, do you?

A. I am not certain as to exactly what was sent to the Hope Construction and Refining Company.

Q. They often transferred pipe to the Reserve Gas Company?

A. How often, I do not know.

Q. At the bottom of page 18 of Exhibit 16-A, you have set out various units of cost encountered in well-drilling operations. Do you have a break-down by units of these costs?

A. I described classes of costs and the working papers disclose in great detail all of those costs.

Q. You state that you made contractors' allowances?

A. That is correct.

616 Q. And did you also state that all of the property would be built by contract under your assumed construction figures?

A. No, sir.

Q. Will you correct me on that?

A. I stated that the Hope Company, or the companies who owned the property, would furnish all of the materials entering permanently into the construction, except the building materials and the like, and that all wells would be drilled by contract, all pipe lines laid by contract, all compressor stations built by contract, but that some of the detail work in connecting lines to the wells and items of that nature would be carried out by the company's own forces. Most of the installation would be by contract under this set-up. Most of the materials would be furnished by the companies.

Q. And did you make a uniform allowance for contractors' profits in your estimate?

A. We made a contractors' allowance that was ten per cent in connection with wells and pipe lines where only the installation cost was involved, and about eight per cent on the contractors' costs on the buildings where we had the allowance supplied also for materials.

Q. And on the compressor station equipment?

617 A. On the compressor station equipment, the contractor's allowance was approximately eight per cent of the contractor's cost, but nothing at all for the cost of his equipment—just on the installation of the equipment.

Q. On page 19 you state that you have selected 330 wells on which your studies were based. Did you have the field conditions relating to those wells summarized?

A. They were all summarized in the working papers.

Q. On page 20, you state that there are large quantities of pipe in the Hope system which are not presently manufactured. Can you tell us what type of pipe that is?

A. You are referring to casing and tubing; are you not, rather than to line pipe?

Q. That should be casing and tubing.

A. The working papers will show just which were the weights and sizes that are not now being regularly manufactured, and I would have to refer to that to refresh my memory.

Q. On page 20, you state that the unit prices used for casing and tubing are based on the lowest quoted prices less 2 percent cash discount, plus freight to average destination. Should there be an additional discount for quantity purchases?

A. They are not available in casing and tubing.

Q. Recently you referred to your knowledge of the drilling of 3,000 oil wells over a period of time.

618 A. Yes.

Q. Do you know whether or not the casing and tubing purchased for those 3,000 wells were purchased at a discount in addition to the ones reflected on page 20 of Exhibit 16-A?

A. They were built at a different time, and I do not know what prices were paid. I have been assured, however, by the purchasing department, which is purchasing materials and has been right along, that for a considerable number of years there has been no discount on the casing and tubing except the discount of 2 percent for cash, and that the drillers of these wells which were in the East Texas oil fields all paid the same prices.

Q. Does that mean that the casing and tubing prices are twenty percent higher than pipe prices?

A. Roughly.

Q. Do you know the tonnage in the Hope system for casing and tubing and transmission pipe?

A. Not offhand.

Q. I believe you have stated that the amount of money was about equal?

A. If I recall correctly, and I would like an opportunity to correct the figures after looking them up, that some 240,000 tons of line pipe was involved and about 150,000 tons of casing and tubing.

619 Q. On page 21, referring to pipe lines, in your final computation of reproduction cost new for pipe lines, did you rely upon the book inventory?

A. The book inventory, the accounting department inventory, and the engineering department inventory were compared and discrepancies found. In many cases the discrepancies were remedied by new surveys and actual field measurements on those lines, and with the exception of the discrepancies which we did find, we reached the conclusion that the book records were acceptably correct.

Q. How did you determine the weight per foot of field and transmission pipe lines?

A. In the case of the major pipe lines—and by that I mean the larger diameter pipe lines such as ten or twelve inch lines, from ten to fifteen miles long or more—there was generally available a record as to the actual weight of the pipe purchased. In the case of the field lines, the records were not so clear, and again they found it necessary to rely on the weights as purchased by the company over a period of years.

Q. But under the method of operating the warehouse of the Hope Company, is it not true that when the pipe enters the warehouse, it loses its identity relative to the weight and number of feet?

620 A. In general, that is so.

Q. In general?

A. Yes.

Q. Is it possible under this method that lightweight pipe of a certain size could be sent to a new construction job, and capitalized in the original cost at a much higher value than the actual tonnage?

A. I don't know what might have happened. I have not examined the details of such transactions.

Q. On pages 21 and 22, you refer to drips. Did you use the book inventory of drips in the trunk lines in your classification of pipe size?

A. The determination of the number of drips of each pipe size was made largely in the field from the records and consultation with the operating men as to the drips. The book inventory was only relied upon incidentally.

Q. Did your men physically inspect the drips?

A. Obviously not, because they are buried.

Q. Did you use book inventory of valves and fittings in the branch lines?

A. No.

Q. What was your source of information?

A. We examined in detail all of the records available with respect to the approximately ten percent of the mileage of the branch lines geographically well scattered through-
621 out the system.

We determined what was there by field records, and we determined from the men in the field what valves there were. In the case of most of the valves, they were in obvious locations and it was merely the unusual valves that were in question, and required investigation, but in general the inventory of valves with their attendant fittings was based upon the field investigations, and by field, I mean both physically in the field in some cases and in consultation with the men who actually had occasion to operate the valves from time to time in the handling of the gas through the system.

Q. On page 22, you stated that the unit prices of the pipe used are based upon the prices quoted by manufacturers generally applicable to carload lots, f. o. b. mill, less 2 percent for cash and 10 per cent discount. Does this carload price given effect to current basic discounts which apply?

A. This carload price less the 10 percent and 2 percent is the price that I have found has been paid for more than a million and a half dollars of pipe by this company and some of its affiliates during the last year or so.

Q. Is it not customary in large quantity purchases
622 for basic discounts to be granted to the purchaser?

A. I don't know what you mean by "basic discounts."

Q. It might be as high as another 50 percent, might it not?

A. No.

Q. I think I will withdraw that; it should be fifteen percent. Does that sound better, Mr. Rhodes?

A. I am not sure that I know what you mean by a basic discount.

Q. Is it customary in the quotation of prices of pipe to give a list price and then a basic discount?

A. To answer that directly, pipe quotations are based first on what is sometimes called car prices. For each and every kind of pipe and most weights, there is a list price that is the same list price practically for all manufacturers. The people who are buying pipe at the time have furnished to them discount figures, maybe 50 percent or whatnot—which figures are also published in the trade journals which, if applied to the list prices, will give the mill price, for the number of feet that is charged for small quantities of pipe. Unless you are a large purchaser, you would pay those prices until you made purchases, approximately a trainload of pipe, but if you are a large purchaser of pipe, you automatically get a ten percent discount, even on ten or fifteen car-
623 loads which the purchaser who is less regular in his purchases would not get until he exceeded a trainload and then negotiated for it.

Now, when any purchaser of pipe is going to buy more than a trainload of any size, he generally negotiates the price.

In the last year and a half, various discounts have been granted. Taking into account the heavy tonnage of pipe that has been bought by this company and its affiliates, and without any discount beyond the ten percent and the two percent, the two percent being for cash, I reached the conclusion that as related to the property of this size, it would be possible to obtain further discounts, not to exceed ten percent of the whole price on all of the pipe, but that no further discount could be available with respect to the purchase of the casing and the tubing.

Q. You spoke of buying a trainload of pipe. Would it require a trainload of pipe to reproduce the Hope system?

A. At least.

Q. And if the Hope Company purchased requirements for reproducing its system within a three year period, under its purchasing arrangement with—did you say the Standard Oil of New Jersey?

A. I don't know what its arrangement is with the
624 Standard Oil of New Jersey, but they do have large purchases of pipe made from time to time with Standard Oil of New Jersey's purchasing department.

Q. That on a negotiated purchase of the requirements to reproduce the pipe line and well systems of the Hope Company, it is very likely that there would be an additional discount, which is not reflected in your inventory here?

A. No. The additional ten percent which I have reflected in my estimate is my best judgment of the saving to be made after full consultation with the purchasing department of the Standard Oil Company of New Jersey, and it is based upon the opinion of the men who purchase most of the pipe for them that ten percent would be a fair amount to expect on these special negotiations.

Q. If Hope Company bought it directly in the quantity required to reproduce its system, would it get an additional discount?

A. In my opinion, they would get this ten percent discount and no more.

Q. Could you state the name of the person upon whose opinion you rely on the large quantity purchases of pipe?

A. Yes, I could.

Q. Will you?

A. I don't know whether I should or not.

625. Q. You relied on that man's opinion?

A. I was guided by his opinion, yes.

Q. I do not want to ask you for anything——

A. (Interrupting.) I am not sure that I should reveal his name. If it means anything, I can do it.

The TRIAL EXAMINER. Did he express that as his confidential opinion?

The WITNESS. Not in the same way that I received this confidential information from contractors and constructors of pipe lines.

The TRIAL EXAMINER. That is his business, to get as much discount in purchases as possible?

The WITNESS. Yes, it is.

Mr. COCKLEY. I see no objection to Mr. Rhodes naming that person, unless he has some personal relations with him.

The WITNESS. I have no personal reasons, and I will look up his initials, I think I have them here. It is A. J. Kelly. He is rated as the Assistant Purchasing Agent, Purchasing Department, Standard Oil Company of New Jersey. And at the time I talked with him, he was the ranking man available, the purchasing agent himself being away.

By Mr. SPRINGER:

Q. On pages 22 and 23 of Exhibit 16–A you state that the construction conditions were surveyed on a portion of the
626 Hope system trunk and branch pipe lines, and recorded in the nearly two thousand field reports. Did you make a

personal inspection of the trunk or field lines construction conditions?

A. No, not in detail. I traveled and criss-crossed the lines of the company a number of times—many times, in fact over the past few years—and I have sent out men to make these inspections who have done construction work under my direction.

Q. You had experienced men then, you say, advising you of these conditions?

A. That is correct.

Q. How many men?

A. I think a maximum of about six.

Q. And could you tell us approximately how much experience each man had had?

A. All of the men had been with my firm for many years, and most of the men had actually worked under my direction on pipe line construction for ten years or more. One of them in particular had actually worked on construction of lines in West Virginia, as well as having worked for me for years.

Q. That was Mr. Evans?

A. That was Mr. Evans.

Q. On page 23, you say that most important are the con-
627 ditions affecting the cost of ditching. What conditions as to depth and width of ditch, and rock and soil conditions did you assume in your reproduction new estimate?

* * *

The WITNESS. The depth of the ditch from which we determined the cost was the depth of the ditch actually existing on the company's lines as found by the depth actually there when the lines were inspected, taking that into consideration, and also a lot of previous inspections. The width of the ditch was that in addition to the diameter of the pipe which we ourselves have found necessary in the construction of pipe lines. The amount of rock was determined by the inspection of the outcrops and
628 the character of the back fill, road cuts and information of that general nature. Other conditions affecting the cost, such as rocky soils, were taken into account, or swampy ground. The slope affects the cost of the ditch, particularly if steep slopes. All of these factors were facts which were recorded by these men who inspected it in detail, and know just what percentage of the lines of each size would encounter the different kinds of construction difficulties, what percentage of rock would be expected to be found.

Q. And all of that is detailed in your working papers?

A. All of that is detailed in our working papers, starting with the field inspection, and with maps and carrying right through to the summaries and the prices.

Q. In arriving at your factors in the cost of ditching, did you consider that many miles of the Hope Company's pipe lines are not underground.

A. We took into account the proportion of the lines which are still above ground.

Q. How did you make that estimate?

A. From every possible source of field inspection. In part by the records of the company. Those lines were largely the small two-inch lines.

Q. Are you sure that there are no large lines that are
629 not underground?

A. I stated they largely consisted of the small two-inch lines.

Q. Do you know the total mileage of the pipe lines on top of the ground in the Hope system?

A. I could refer to the working papers and find out. I have not that available here. There is approximately 3,000 miles of production system lines and approximately 1,000 miles of transmission lines. A small part of the field lines is above the ground, and that is reflected in the pricing which is all shown in detail in the working papers.

Q. Is there a segregation of pipe lines underground and above ground in your development of unit costs, or did you apply an average to both?

A. In the development of unit costs, we found the proportion of each size of line that was above the ground, and the proportion of each size which was below ground and its corresponding depth. The unit price was determined for the above ground pipe and the below ground pipe, and a weighted-average unit price was arrived at for all of the pipe of each size, taking into account the proportionate lengths above and below ground.

Q. Do you know what percentage of field lines are above ground? Do you know approximately?

630 A. I don't recall the figures. I will be glad to look it up.

Q. Would it be as high as twenty per cent?

A. I would not think it would be that high. I would be glad to look it up for you. [Examining papers.]

Q. Would you please give us the proportion for each size of line that is above ground tomorrow some time?

A. I will have to look it up, yes; and I will be glad to give it to you.

Q. On page 24, you state that the unit costs for pipe lines are based upon the company's furnishing materials and the contractors installing those materials, in permanent locations?

A. Yes.

Q. From what responsible contractors did you secure bids for the installation?

A. I did not secure bids from any contractors. I did secure contractors' records of costs in West Virginia.

Q. How do you know what a contractor would charge for installation?

A. I estimated a fair price would be paid to contractors for installing these lines. That price was based in part on consideration of the actual cost to the contractors who have
631 actually laid lines in West Virginia as well as other costs.

Q. You say "in part." That was the basis for your estimate?

A. The actual costs in West Virginia were taken into consideration; yes.

Q. Would that be a check against the ordinary estimate of your hypothetical crew, plus ten percent, in determining the cost of installation?

A. I did not set up any hypothetical crews. I determined practically what it would cost to reproduce these lines under the conditions which actually exist in West Virginia.

Q. Don't you have in your working papers for the development of unit costs, labor performance and the number of men required to construct a given portion of the Hope Company's system?

A. Those unit costs how for each sized line in each character of country and each character of holding and each amount of clearing in the right of way; they show in detail the numbers of men required for each operation and the cost required for each operation of the sizes of pipe that determined the particular class of equipment that is required in the building of lines. Light equipment, for instance, is required in the small pipe, and heavy equipment is required in heavy pipe. Those details involve
632 something like a hundred different combinations and permutations of the conditions, for which details have been set up as to the daily progress, the number of men, the equipment that would be required, and everything that is necessary to determine the costs in any and all of the widely varying construction conditions in this State.

Q. On page 24, you speak of ditching. Is it true that machine ditching costs much less than hand ditching?

A. Not universally.

Q. What are the exceptions?

A. When the country is hillier than a slope of about one in four or one in five, it is practically impossible to use machines in ditching. Up to that slope it is possible. In flat country, the ditching machine will dig a very, very cheap ditch. It requires no assistance except that of men to trip out the ditch and to grade the ditch to cover the variations in the depth required. As the country gets rougher, this ditching machine has to be helped with a tractor or bulldozer to grade the right-of-way, and as the country gets heavier and harder and harder, more and more equipment must be with the ditching machines, so that in what is called, or what is classed here as complete machine ditching, is about five machines besides the ditching machine. Even
633 that part of the complete machine ditching in places is cheaper than the hand ditching, but when the country is broken, as it is in West Virginia, the cost of getting the machines over the valleys and up the hills that are too steep to use this machinery is so great that all of the saving of the ditching machine is completely lost in the cost of moving the machinery.

Q. Do you know whether or not machine ditching has been used on a large portion of the Hope system?

A. It has been used on much of the Hope system.

Q. You have used in your estimate of reproduction cost new, hand ditching for 4,000 miles of pipe line; isn't that true?

A. The final result is that, but the working papers will show what it will cost with machine ditching, and it would seem that the hand ditching is cheaper than machine ditching in this territory.

Q. Is that based upon experience?

A. It is based upon the experience which we have had. It is based on information that I have gained from contractors who have used this method of ditching in the country, namely that the machine ditching does not pay or save anything. You can do the work just as cheaply by hand, the detailed analysis that appears in the working papers shows that to be the case.

Q. Could you name the contractors you have just re-
634 ferred to?

* * *

The WITNESS. William Brothers built a sixteen and twenty inch line from a point near Cedarville to a point not very far from Wheeling. They used a great deal of machinery on that

line and they had a great deal of trouble with that machinery. I was told by both of the Williams Brothers separately and by their general superintendent who handled the job that the machine work did not pay. I believe there were three gangs equipped with machines and one gang by hand, and the hand gang did the work as cheaply as the machine gangs.

By Mr. SPRINGER:

Q. Do you know the construction experience of Williams Brothers in building a line for the Manufacturers Light & Heat Company?

A. That is the line to which I referred.

Q. And they concluded it would be less expensive to have used hand ditching?

A. They said, as I have already stated, that they saved nothing by the machine work.

Q. Mr. Rhodes, how did you determine the labor cost for ditching?

635 A. The labor cost of ditching is the composite result of starting out with what the average laborer will do when he has easy digging in flat country without any rain to interfere, and averaging as to what he does when things are going right. We started out with that, which is approximately half a yard per hour. Men do not dig that much in West Virginia for a number of reasons. First, the soil is rocky and slows him down, and probably you could not expect more than about four tenths of a yard per hour. I am now talking in rough figures by the way, for purposes of illustration.

In the other extreme, on a very steep hillside, a man can dig perhaps not much slower than he can dig in the low country, but other men have to be made available to shore up the back fill to keep it from running downhill. Many of these hillsides on which pipe lines are built in West Virginia are so steep that if you start a rock rolling it will keep on rolling until it gets to the bottom. It takes fully twice as many men to take care of the digging of a ditch in that kind of a country.

Of course, rock enters into it. Whether it be loose rock or hard rock—all of which is taken into account—but to determine the cost of hand ditching or any other kind of ditching in
636 a country as difficult as West Virginia is a long process, but all of the details are available in the working papers.

Q. Did you check your estimate by the actual experiences of the Hope Company in hand ditching?

A. Yes.

Q. Is your estimate higher or lower than the actual experience of the Hope Company?

A. I do not recall the exact figures, but our performance for the different sizes of line, and the different construction conditions were harmonized with the known costs of a great many lines. Dividing the country as we did into different classes of country, we were able to take advantage of the cost of digging in part of the country other than West Virginia, where we knew the construction conditions. We had lines, for instance, in Pennsylvania, where we classified the country as it is here. We had lines in Kansas and at various places, so that we would know what the costs are. All of these costs entered into it. We did not depend solely on the Hope's man-hour performance in building one line, but we depended on other people's performances. Now, as to how the Hope experience agrees with the most exact figures, I don't know.

Q. Those performance figures are available, are they not?

637 A. They are available on that analysis which was mentioned this morning where the working papers have not been finished up for general informaion.

Q. Of course, the ditching conditions in the Middle West are not comparable to the ditching conditions in West Virginia, are they?

A. Yes, they are; in the same character of country, the same rock, and the same soil. If you start in with easy hand digging in flat country, it does not make any difference what state of the Union it is in, but how much rock may be in the soil will affect the cost, and we take that into account on the West Virginia rock. We do not take it into account on the Colorado rock.

Q. Do you know the total cubic yards of excavation which you assumed would be required to construct the pipe line of the Hope system?

A. I have not calculated it.

Q. Do you think you could calculate it?

A. Yes; I could.

Q. You do not have those figures available now for computation, do you?

A. They are available in Clarksburg, but the actual computation would take several minutes of the time of this hearing, or maybe half an hour.

Q. How much did you assume a man could dig in a day,

638 for your reproduction cost estimates?

A. We started out, as I say, with perfect digging, where a man would dig half a yard an hour.

Q. You did not use that in your final estimate?

A. We started out with that, and adjustments were made for rock and for slopes and for hillsides. If I recall correctly the average was between something like a third of a cubic yard per man per hour, but it is so complicated with rock and other features that in itself it means little.

Q. Will your working papers show the rock percentage assumed in your ditch digging?

A. They will show the rock percentage that was found by field inspections, and was used in determining the unit costs.

Q. You made spot checked for rock conditions?

A. They were checked by careful examination of some two thousand miles of right of way.

Q. And throughout your reproduction cost new estimate, you have assumed that all of that property would be reproduced by using all new material, isn't that so?

A. I priced all of the materials as new materials, Yes, sir.

Q. Do you know that there are hundreds of miles of the Hope system which were constructed with used pipe?

A. I don't know what exactly the mileage is, but I do
639 know that there is a great deal of pipe in the Hope system, that was once in another location and was purchased new by Hope originally.

Q. How do you know that?

A. As to the exact mileage I do not know, but as to the amount of pipe that has been bought and various movements of the lines with which I am familiar that necessarily followed.

Q. Do you know that H-199 is constructed with secondhand pipe?

A. The number means nothing to me. I will have to know where the line is.

Q. Will you please turn to page 25 of Exhibit 16-A. Will you describe the compressor station equipment which you say was priced for the nearest of size and type, when no equivalent was available? Have you already given us that?

A. I gave you that this morning, as far as I could go by memory.

Q. What check did you make to determine whether the price quotation you used in your estimate of compressor station equipment were the prices then paid for actual purchases in kind and quantity required of the Hope System?

A. First we asked the manufacturers to give such prices and we obtained prices from the manufacturers which purported to be that. We found that some manufacturers were giving us
640 lower prices than other manufacturers. This was particularly true as to one manufacturer, and we made very careful oral inquiry from that manufacturer by visits to his factory to find out whether or not the prices he was giving to us really reflected the price at which he was selling goods, and as a result of that extended investigation, we have every reason to believe that he was giving us prices that were actually in line with current sales prices. Furthermore, they are in line with our own experience in buying 50 thousand, 75 thousand horsepower of such equipment within the last ten years.

Q. What is the name of that manufacturer?

A. The manufacturer particularly asked us not to put in the record his name.

Q. Had the National Transit Company manufactured many of the compressor station units that were used in the Hope system?

A. A great many.

Q. And that is a subsidiary of Standard Oil of New Jersey, is it not?

A. No.

Q. Was it once?

A. It was once a part of the Old Standard group that was dissolved many years ago.

641 Q. Did you rely upon prices quoted by the manufacturer who is selling incognito here, whose prices were the lowest for compressor station equipment?

A. Where the prices he quoted were the lowest, we used them, but where they were not the lowest, I do not recall exactly where, but in some cases he was not the lowest, and I used other prices. In other words, I tried to get the lowest priced compressor station equipment that would be used in these stations.

Q. Did you check those quotations against actual purchases in the last two years?

A. The actual purchases of large compressor units are not sufficiently common. We have purchased a great many units ourselves, and the last purchase was some three or four years ago, of those large units, and I reached the conclusion that the prices that we had quoted and used on the units were pretty much rockbottom prices.

Q. For 1938?

A. For 1938 and 1939, and in most cases they were lower than the prices we had actually paid for the equipment which we bought.

Q. Did you consider the fact that much of the Hope Company's compressor station equipment has been substantially altered by the company since it was pur hased?

642 A. No. We priced all of the equipment that we priced at the prices of like equipment.

Q. When you say "like equipment" no such equipment exists.

A. By "like equipment" I mean if the company owned a four-cycle twin tandem gas engine with a 36-inch stroke, twenty-inch diameter of piston, I priced the engine at what it would cost for such an engine today without reference to who made it. I used the lowest prices available today for an engine of such a description. Details of manufacture may be different, but the engine is essentially the same engine.

Q. You mean essentially in performance, but it is really substitute equipment, is it not?

A. It being impossible to buy equipment such as now exists, without having to buy it made especially to order, I priced about what commercial equipment of the same description could be obtained for today; where I have no means of checking exactly the same size and dimensions, I took equipment that could be obtained today that was nearest in description to that which the company owned.

Q. The price quotations which you secured from manufacturers of equipment could not reflect the price of Hope's altered equipment, isn't that so

A. (No response.)

643 Q. Hope has made substantial alterations on some of its compressor station equipment, and when you get quoted prices for substitute equipment, they could not possibly reflect the cost to reproduce that particular equipment?

A. I am reflecting the cost of present-day commercial equipment of identical description. A twenty-inch or thirty-six inch stroke single tandem four-cycle gas engine is that whether it is made today or was rebuilt by the company.

Q. Did you price any of the engines on the basis of weight?

A. No, I do not recall of a single case where I priced them on the basis of weight, except to the extent of weight being a factor in freight. Engines not now obtainable as such are priced on the

price per horsepower of the nearest comparable equipment commercially available today.

Q. On page 25 of Exhibit 16–A, does the miscellaneous equipment which you stated was about one percent of the total include the machine shop equipment located at the compressor stations?

* * * *

THE WITNESS. The major machine tools, costing roughly $400 or more were specially priced. This miscellaneous equip-
644 ment of numerous small things like small grinders, related to machine tools or maybe a small drill press, as well as hand tools, as well as all kinds of odds and ends which comprise a very long list as related to any one station.

Q. Where did you get your prices for them?

A. The manufacturers of light equipment.

Q. On page 26 of Exhibit 16–A, in determining the cost of erecting compressor station equipment, did you give any consideration to the experience of the Hope Company at the time those stations were constructed?

A. No.

Q. It is true that the Hope Company actually erected compressor station equipment gradually, over a period of years?

A. That is correct.

Q. Would there not be a substantial lowering of the costs in erecting compressor station equipment in your three-year wholesale scale, as compared with the Hope Company's actual experience?

A. There should be no substantial difference, for Hope's whole costs were known. Our experien e in erecting equipment of this kind was compared by conference with the experience of the Hope men who had been erecting equipment and it was found that our man-hour experience for a given size and kind of ma-
chinery was reasonably in line with the company's own
645 experience.

Q. Do you mean that you adopted piecemeal experience for your wholesale construction estimate?

A. It is not piecemeal construction to erect all of the equipment in a given compressor station. The operation of that size is one that would generally be handled by the company's particularly skilled laborers and riggers, and the number of men employed in the company's operation is such that even the outside men they had to hire were well known workmen. That cost

by the company in building individual stations would be expected to be at least as low as the cost the contractor would be able to meet, even with the erection of a large number of stations on a three-year program.

Q. As a practical matter, though, you could build two compressor stations and completely equipment them in succession, for less than you could build one this year and one next year?

A. Somewhat less, but the labor cost in erecting equipment represents in the aggregate something of the order of five or six percent or thereabouts, so that it does not mean much money.

Q. On page 27 you referred to the installation of compressor station equipment by a contractor with an appropriate allowance. What is contained in that allowance?

646 A. The allowance amounts to approximately 8 percent of the contractor's whole field cost. Out of that allowance he must pay whatever gross income tax is required in West Virginia from him. He must pay any permits or licenses to work in West Virginia. Other than that he must take out his general overheads and set aside something to insure him against abnormal losses which occur from time to time due to unforeseen acts.

Q. Is that all?

A. I think so.

Q. Did you secure a bid from a responsible contractor for the installation of compressor station equipment?

A. No.

Q. How did you determine the assumed contractor's allowance?

A. This contractor's allowance of about 8 percent is the minimum allowance that the contractors look for in this contract work. They customarily, in figuring their costs, like 15 percent to cover the items for which I have allowed 8 percent, and I made my allowance, as in the other work, by contractors, as the minimum allowance for the general overheads and profits that a contractor is willing to contemplate in doing work.

Q. And how did you know that that was the minimum
647 allowance, that 8 percent?

A. The minimum allowance contemplated is arrived at from having let many millions of dollars of contracts and doing all kinds of construction work, as well as having made estimates of millions of dollars' worth of construction work where we ourselves had to stand the loss, if there was any.

Q. You say you have let the contracts?

A. I worked both ways.

Q. What compressor station equipment has been installed on the Hope system by a general contractor?

A. None so far as I know, excepting boilers that have been purchased, that have been erected by the manufacturer.

Q. Does the Hope Company carry on its pay rolls competent engineers and mechanics who are likewise competent to install compressor stations, and who make such installations?

A. Yes. The Hope Company has a nucleus of men who would do that. The men do that who handle the heavy major repairs on the equipment, that are required from time to time.

Q. On page 26 of Exhibit 16–A you state that the inventories were made, station by station, of the essential assemblies of valves and fittings, such as those required for high-pressure gas connections. Was that a physical inventory or an estimated inventory?

648 A. That inventory was made from the drawings available for most of the stations. The greater part of that pipe is not visible—it is buried, and we did not dig it out.

Q. If there are any errors in the drawings, those are reflected in the reproduction cost estimate?

A. Not directly so: We included in the bill of materials for these connections those materials which represent the company practice in connecting up of such equipment, which is in accord with the practice of the industry. If the company had in a thousand pound valve for three hundred pound service we made no allowance for that, but we made allowance for those major variations in the types of connections which affect the cost.

Q. Then you estimated the inventory?

A. No.

Q. You said some of it was not visible.

A. That is true, but there were available drawings. The connections between the compressor and the line pipe to who *who* knows compressor stations, are obvious. You don't know what make of valve may be underground, what make of fitting and would of necessity depend upon drawings, whether the fittings be screw fittings or welded fittings or whatnot.

Q. Don't the plant ledgers reflect the quantity of valves and fittings in each compressor station?

649 A. We did not go to the ledgers: we went to the drawings which showed the valves which were necessary in the operations of the stations. If there were any valves there that were not used, they were not shown on the drawings, and were accordingly omitted in this inventory.

Q. On page 26, you state that the cost of installing complex connection piping is based on experience. What experience is that?

A. Labor performance of erecting different kinds and sizes of fittings, and valves and so forth, has been rather well standardized. We secured from two large piping contractors, the standard labor performances, and we priced the labor costs of certain jobs which we had done ourselves, and in which we had completed detailed information, to find out what adjustments these contractors' performances—piping contractor performances were necessary to reflect the cost of piping of the nature which exists in compressor stations. We found the amount of that discount, and in all of our pricing we applied that discount to the labor performances these piping contractors say is necessary to install piping. Their figures are generally based on piping buildings that is up above the floor. In compressing station piping, most of the piping is about at the ground level at the time the station is built, and the discount below the customary performances reflect that fact, based on our experience in laying pipe for compressor stations.

650

Q. Did you study the Hope Company's experience in the installation of the complex nature of the piping?

A. The Hope's experience in that connection was not sufficiently detailed to be of any assistance to us.

* * *

663 Cross-examination (continued) by Mr. Springer:

Q. Mr. Rhodes, on page 27 you state that a separate allowance is made for the cost of hauling materials to each compressor station at average cost per ton reflecting distance and the kind of road. Are those average costs per ton based on a contract price?

A. No; they are based on the estimated cost of hauling materials, and the basis was the lowest ton-mile cost of hauling pipe.

Q. Was the cost based on experience, then?

A. All of the costs here are based on experience.

Q. Of the Hope Company?

A. No; on the experience of my organization, and as I said before, on the results of other people's experience, including, to a limited extent, the Hope Company's experience, but in hauling. Hope Company's experience appeared only to the extent of consultation with their operatives in their own work. The figures

are not exact figures based on Hope's experience, since they are not available over any considerable mileage of line.

Q. On page 27, what type of property do you include
664 under "Miscellaneous minor property?"

A. All of the other accounts than buildings, structures, gas wells, pipe lines, compressor station equipment and lands and rights-of-way. All other classes of property which, in the aggregate, only amount to three per cent of the total. Meters and regulators, for instance, shop equipment, general equipment. They cover the principal items.

Q. How did you price that miscellaneous property?

A. Using the same general methods as have been described with respect to other property. Items of property that were identifiable as such, for instance, as machine tools, not in the shops, or regulators, meters or fittings—they were all inventoried by making a check between the records in the offices of the company and the existence in the field of the particular things in question.

Prices were all obtained from manufacturers who were requested to give us the lowest prices available and the labor of installation was based, as in the case of compressor stations, on the same basic experience. Most of the equipment contained in these miscellaneous accounts is of the same general type as is contained in the major accounts.

For instance, valves and fittings involved in the meters required just the same method of treatment in pricing as valves and
665 fittings involved when they are in a compressing station. A lathe in the general shop is treated the same as a lathe in a compressor station repair shop.

Equipment like drilling and cleaning equipment, which of course is not a thing which is erected, is priced at cost delivered to average destination.

Q. Did you receive manufacturers' quotations on the drilling and cleaning equipment?

A. We did. In fact, the pricing of drilling and cleaning equipment, which is a very complicated system, was actually done for us by one of the most prominent dealers in that equipment, based on their current sales prices.

Q. Who was the dealer?

A. I don't recall at the moment. I would have to look it up in the working papers.

Q. You said he was the most prominent?

A. One of the most prominent. I think it was the Oil Well Supply Company.

Q. On page 28, why did you not use reproduction cost of land instead of cost to reflect what you term "current value" in your reproduction cost new estimate?

A. In the first place, you cannot reproduce land.

Q. Should it be included in a reproduction cost estimate then?

A. If it is properly marked for what it is.

666 Q. Then you do not have a reproduction cost estimate of land in a reproduction cost estimate of the system, do you?

A. This land—that is technicalities of words—but land is in here and it is clearly explained how the pricing of land was arrived at—the most important site being the office building here in Clarksburg, and it was carefully explained that this was all priced at the same price per acre as was paid for the neighboring lot which was purchased in July 1938.

Q. You used what are known as market prices for other items of property. Do you say now that you have used market prices for land?

A. Not in the broad sense that I analyzed real estate transactions throughout the City to arrive at a present value. In this particular instance, there was a parcel of land contiguous to the existing parcel, almost the same size, that faced on the same two streets. Whether that was a market price or not, it was the price the company actually had to pay for the land, and I deemed it to be an appropriate measure of the current value of the entire lot.

Q. Wouldn't you be consistent if you took the price paid by the company for other items of property?

A. No; because this was a recent thing. It is the only transaction in the neighborhood that was available, and that was used. I might have used book cost of land, but I deemed

667 it more appropriate in cases where I had more recent information as to the prices paid for land, to use the more recent prices.

Q. The land in the Hope system has not been purchased within the last two years, has it?

A. That particular parcel which I used as the guide for the current value of the office building site was purchased in 1938.

Q. For an addition to the office building?

A. That is correct.

Q. Would any other tract of land have been as satisfactory?

A. I don't think any tract could be quite as satisfactory as an abutting tract of practically the same size as the one involved.

Q. Was there a house on the first tract of land that was demolished?

A. Which tract do you refer to? The one which was recently purchased or the original tract owned by the company?

Q. The one that was recently purchased.

A. Yes; there was a house on that.

Q. And what adjustment did you make for that?

A. None whatsoever. The tract of land was brought for the purpose of building an office building, and it was known
668 that the house would have to be demolished and is properly a part of the cost of land and is customarily so considered.

Q. Was the building on the lot a part of the consideration, do you know?

A. I know only that they bought the land on which to build the office building, and tore the house down not very long afterward.

Q. On page 28, you state the Hope Company owned rights-of-way for which no payments were made. In your reproduction cost estimate, do you assume that payments would be made for those rights-of-way?

A. I assumed that they would be obtained free as they were obtained, mostly being rights-of-way that were included in the leaseholds.

Q. You also state that the company owned rights-of-way aggregating 180,125 rods for which no payments were made. Will you please turn to Exhibit 16-B page 6, and explain the difference between the 180,000 rods and the 252,000 free roddage grants shown, using round numbers?

The WITNESS. On page 6 of Exhibit 16-B, 252,911 rods is a balancing figure, so that the sum total of the roddage
669 is equal to the total roddage of the pipe lines. The 180,000 rods, I cannot specifically name without reference to the working papers. It may be cases where there were specific grants of rights-of-way for which no charges were made, whereas the 252,000 includes such specific grants as well as those which are incidental to leaseholds.

Q. Would you be able to furnish the explanation later?

A. I would be glad to.

Q. You state that the Hope Company, page 28, of Exhibit 16-A owned 980,655 rods of purchased rights-of-way. Please turn to page 6 of Exhibit 16-B and also to page 14 of Exhibit 16-D and explain the difference between the apparent total of 992,501 rods.

A. I would have to look up the working papers to find the source of the differences. In the text, the figures are given for illustrative purposes, and in the priced inventory, they are based on actual figures, but they can be reconciled and I would be glad to do so.

Q. There is a difference of 12,000 rods between the detail which you show and the text figure. That is so, is it not?

A. That is the approximate difference, yes.

Q. You might have included the rights-of-way on the coke oven gas lines?

A. Not intentionally.

670 Q. On page 29 of Exhibit 16–A, you state that the average cost per rod of the present trunk line rights-of-way was taken as the measure of reproduction cost. Does this average cost include the cost of clearing rights-of-way?

A. It does not. It is the payment to the farmer for the right to build the line across his land, plus the damages paid to the farmer, plus the cost of securing the paper, and so forth, but there is no clearing of the rights-of-way included.

Q. In what account did you include the cost of clearing rights-of-way?

A. As a part of the cost of constructing the pipe line, under which activity it is incurred.

Q. Is that in accordance with the uniform system of accounts prescribed by the West Virginia Public Service Commission for gas utilities in 1939?

A. I do not recall the details of that particular account, but I have included the cost of clearing as a part of the cost of the operation under which it is performed.

Q. Does the cost of the rights-of-way vary with the size of the pipe line constructed?

A. In general, yes; but the company's record of experience did not permit that determination without an unwarranted amount of work. We found the company's records were

671 relatively clean-cut, as between trunk lines and field or gathering lines, and we studied them separately and arrived at the unit costs which are set forth in the priced inventories.

Q. On page 30 of Exhibit 16–A you list the components of your undistributed construction costs. Can you translate each percentage into the respective dollar amounts of your reproduction cost new estimate?

A. Such a translation is a mere matter of arithmetic. These percentages, however, were first agreed to in the former Cleveland cases, and used by the Ohio Commission. I merely adopted them in the aggregate.

Q. Did you make any check to see whether they were proper in your reproduction cost new estimate in this case?

A. Yes.

Q. What kind of check?

A. I made two kinds of checks. In the first place, I compared these allowances with actual experience in the construction of properties with which I have been closely associated, which were built by newly organized, independent corporations, rather than by large operators in the business, and I found as a result of those checks that the aggregate amount of the first four items, namely, preliminary organization expense, engineering and superintendence during construction, administrative and legal
672 expenses during construction, and taxes during construction, I found that in the aggregate these agreed rather closely with my own experience, but were rather lower than the figures which I had available from that experience. ——

* * *

Now, the matter of interest would not conform to the particular experiences of mine because none of them extended over a three-year period.

The other sort of a check that I had been making is evidenced in another exhibit, where the actual cost to the company of building its properties was determined, and it was found in recent years that the administrative costs which included the usual administration of the property in its operations and construction, plus the supervisory of the top portion of the engineering, averaged about 6 percent, exclusive of taxes.

That check of the company's experience in the actual administration of its affairs, combined with the experience in the actual construction of new properties by independent corporations, confirmed me in my belief that this 9 percent for the four
673 items mentioned was a fair and reasonable allowance which probably would be exceeded in actual practice.

By Mr. SPRINGER:

Q. Now, translating the preliminary organization expense which you have assumed in your estimate of 5 percent, into dollars, roughly would that be $403,000?

A. Roughly, yes.

Q. Now, translating engineering and superintendence during construction, which you have assumed to be 4.5 percent, translated into dollars, would that be $3,631,000?

A. Substantially.

Q. Translating administrative and legal expense during construction which you have assumed at 2 percent, translated into dollars, would it amount to approximately $1,614,000?

A. Approximately.

Q. And the taxes during construction, you have assumed at 2 percent, approximating $1,614,000?

A. The figure is correct, but I did not assume the percentage.

Q. Interest during construction, you have used 8 percent?

A. That is correct.

Q. And translating that into dollars, it approximates $7,100,000?

A. Approximately, yes.

674 Q. Please state the items which you assumed would comprise preliminary organization expense, giving the dollar amount allocated to each item.

A. I have made no assumptions or no break-downs in detail of these totals. As I have explained, I used those which have been previously and repeatedly used in connection with the properties, which I found were in accord with my own experience. I made no break-down except in a study which I made of the properties, with which I was familiar. The details or such as were available, were broken down and classified to fit the set-up of this reproduction cost new.

Q. Can you list the items that ordinarily go to make up the preliminary organization expense?

A. Starting at the beginning, there is generally an investigation of the project to determine its feasibility. It includes investigation from the economic standpoint, from the geological standpoint, and from the legal standpoint.

Following that preliminary investigation, if it is promising generally a more extended investigation is made. If the project is still worthy of consideration, then a corporation is usually organized, which involves legal expenses, and the expense involved in actually forming the corporation. I am talking now from the standpoint of the things done, rather than from the accounting standpoint, because remember, I do not neces-

675 sarily subscribe to this break-down here.

Q. You used it in your estimate?

A. No, I did not. I specifically stated that I used the aggregate allowance as being proper.

Q. In your mind, didn't you use the customary components of preliminary organization expense, engineering and superintendence, administrative, legal, taxes and interest?

A. Only in a general way. It has been my experience in construction of these properties, that it is almost an impossible task to divide the expenses accurately as between these various classifications.

Q. Yes?

A. For instance, in the construction of the Southern Natural Gas Corporation, which I described yesterday, my time was divided between engineering and general executive engineering supervision of the work, and also the executive supervision of all of the corporate activities other than those having to do with relations with public authority and with the bankers. All of the accounting was carried on under my direction.

The question arises then, how should my time be divided, which is between engineering and administrative expenses? I had men working for me in dual capacities. Some of the men that were really a part of this purely corporate organization for handling public relations work, worked for me parts of the time and part of the time they did not, so that it is very difficult to divide the costs, even as they are being incurred, between these various classifications of engineering, preliminary and administrative.

676

And I have found that to be the case in the actual operation of constructing the properties. The principal job is to get the property built as cheaply as possible, and the accounts are not kept in a manner during construction periods to facilitate the making of estimates of this kind in any detail.

Q. Do you have any difficulty in relating such costs to direct costs?

A. That generally also requires special thought to compare with an estimate such as made here where the construction—miscellaneous items enter into construction cost, like purchasing, for instance, are included in construction costs. It is necessary generally to separate portions of the cost which may be incurred as a part of your office expenses that should be charged properly to construction.

For instance, on the Southern Natural Gas, there was a considerable amount of construction work, possibly of the order of $1,000,000, which was carried on directly under my supervi-

677 sion, where a defaulting contractor's work was taken over in part, and for building meter stations and things of that nature.

Some portion of my time might be charged to construction, but there is no way of positively arriving at it and even if a decision were decided to try to keep your accounts straight it would necessarily be an arbitrary division of the time of all of the men who were doing work of an administrative nature that was related to the various and sundry activities that were going on simultaneously.

Q. Do you know the cost by classes of property in the 1931 East Ohio-Cleveland rate case, from which you have borrowed these indirect cost percentages?

A. These figures were taken from signed agreements.

Q. Do you know what costs were included in the classes of property to which these percentages were applied?

A. These percentages were applied to all property except leaseholds and working capital.

Q. You don't know what costs were included in the classified property accounts to which these percentages were related, do you?

A. I don't recall the figures; no.

Q. Do you know the class of costs of the property to which the percentages were applied?

A. They were applied to the estimated cost of reproduc-
678 ing substantially the same property that now exists.

Q. Do you know in the 1931 Cleveland rate case whether Workmen's Compensation insurance was included in the classified property accounts?

A. I am quite sure that it was, but I would prefer to look up the records of that particular estimate.

* * *

Q. Do you think, Mr. Rhodes, that preliminary organization expense should apply to operating automobiles?

A. These percentages, if you use them as such, are for the purpose of spreading the costs over the various classes of property, and if any attempt is made to say that this item of expense applies to this item of property and not to that item of property, one would arrive at the most tangled mazes of impossibilities that could be imagined.

Q. Perhaps you started with an amount of money then and spread it on percentages that you thought might be fair?

A. Experience starts with the amount of money that is to be spread over the prime cost, which is also an amount of money, and it is turned into a percentage which we use, in the practical preparation of these estimates.

679 Q. How were you able to determine the proper percentages for overheads, without knowing the amount in the classified basic properties to which the overheads are applied?

A. That question has no meaning to me.

Q. Don't you have any relation between overheads and direct costs?

A. In this way we do. Direct cost could be set up in such a way that there would be nothing contained in them whatsoever except payrolls and checks paid to manufacturers of equipment and supplies. Then you would have a statement: "Here is material paid for to the manufacturers at so much, and here is labor paid for to the workman at so much, and everything else is overhead."

You could make an estimate that way if you wanted to, but in choosing the percentages of overhead to be used, the estimator must have clearly in mind the line of demarkation which I have had in this case, and in comparing my own experience, I have made the same line of demarkation between the prime costs and these overheads, as has been made in the estimate of the reproduction cost of this property.

Q. And I assume that is the same formula that was used in the Cleveland case?

A. Substantially the same formula, but I base my judgment as to the reasonability of these overheads upon my own experience.

679-A In the former Cleveland case, it was assumed that the lines would be built by the company at higher wages paid by the company than contractors paid.

Q. Is it true that the percentage for engineering and superintendence during construction decreases as the cost of the project increase, particularly when the project is based on large units?

A. To some extent it does.

Q. Mr. Rhodes, as an engineer, would you design and construct the Hope system as it exists, if you were retained to build the system now?

A. What would be built now is a matter of the substitute property as a whole. I am really concerned with the engineering cost of designing the property substantially as it exists, within

the limitations of the commercial availability of materials and equipment.

Q. Is the Hope system the most modern and complete system that could be built today?

Mr. COCKLEY. I object to that. That is not proper cross examination and it is not a proper question to ask of any witness.

The TRIAL EXAMINER. Read the question.

(The question is repeated.)

Mr. COCKLEY. I suppose it is true that each year, if you
679–B were to reproduce a property and wanted to put in all of the latest wrinkles and so forth there is not a year that goes by that you could not make a little change here or there or what-not.

The TRIAL EXAMINER. Do you have any objecion to the witness making that statement?

Mr. COCKLEY. No, but it seems to me that we have wasted enough time.

By Mr. SPRINGER:

Q. You concur in that, don't you, Mr. Rhodes? You concur in Mr. Cockley's statement?

A. I concur in what Mr. Cockley said.

Q. Is not the engineering and superintendence during construction of oil pipe line properties comparable to that required for the construction of natural gas pipe line systems?

A. When built in properties of comparable magnitude, yes.

Q. Do you know that the Bureau of Valuation of the Interstate Commerce Commission and the major oil pipe line companies use less than one quarter of your figure of 4.5 per cent for engineering and superintendence during construction?

A. No, I don't know that. But there again it is a question of how much on the engineering is charged directly to the construction, as it is on the Hope's own books, and as it was
679–C in the case of the properties which I have constructed.

I have extracted the engineering charged directly to construction and grouped it together as engineering. It is quite customary in building properties, for the sake of simplicity in accounting, for instance, when surveyors are out locating the line, to charge their time and their automobile expenses and so forth to that particular line, and when inspectors are out inspecting construction on that line, to charge the time to the line. And the same in map making or making the drawings necessary.

What may have been the elements of cost included in the prime costs by the Interstate Commerce Commission I do not know, but I do know that you cannot design, supervise the construction, and inspect the construction in pipe lines for a quarter of this figure that is given here, and I have designed and constructed thousands of miles of it.

Q. Do you know that the Bureau of Valuation of the Interstate Commerce Commission uses 1½ per cent for all overhead, exclusive of taxes and interest?

A. No, sir.

Q. Do you have within your knowledge the approximate investment in pipe lines in the United States?

A. I do not recall.

* * *

679-E Q. On page 30 will you state the components of your assumed administrative and legal expense during construction?

A. Again, without considering the exact accounting definition of various classes of work assumed, the administrative expense would include elective officers, as the president, vice president, secretary, treasurer and assistant treasurers, and so forth, and in the case of an operating property, it would include all the expenses incurred by and on account of these particular men. These particular men would be assisted by a staff of assistants considerably greater than the staff that is required during the operation of the properties. The accounting department, for instance, would be much bigger, because the volume and the amount of the transactions are greater.

There would be legal expenses in varying amounts, depending upon the circumstances as they developed during construction. There would be printing and there would be telephone and telegraph and automobiles in the use of these administrative officers, in fact the organization to handle the corporate affairs, the administrative affairs, is very much similar to that of the later operating organization, being only very much larger.

679-F Q. Speaking of taxes during construction, what base did you use to compute those?

A. I made no computation. Taxes during construction as they may well be assessed in this State, could easily cause the total of these undistributed costs to exceed the amounts which we have used.

As previously stated I am subscribing only to the aggregate amount of these allowances as being the minimum that could be

incurred in the construction of property such as this property constructed in the manner which I have described.

Q. Does it include the sales taxes and excise taxes as well as property tax?

A. I have made no specific assumptions, but in connection with the sales tax or the gross income tax to be paid by contractors, that comes out of their allowance, and is not included in here. I have made no specific estimates to the amount of taxes that might be incurred.

Q. Taxes are not assessed until the property is completely constructed, are they?

A. As a rule they are, depending upon the customs of the State in question, and I am assured by the attorneys of the company, that in the event of the reproduction of this property, taxes would be most certainly assessed on parts of the property that
679-G were in existence on the tax dates, whether they were in operation or not.

Q. Under your assumed three-year construction program, would properties completed and assessed on a tax date be considered available for operation also?

A. In some cases yes; but in most cases no.

Q. Why not?

A. Because in some cases, property would be exatly ready for operation on the date of taxation. I am informed in that particular case, whether the taxes should be charged to operation or construction is quite a question. If the taxes were assessed the day before operation began, would that be taxes during construction or otherwise? I have made no attempt to estimate it. It is the most complex estimate and again, as I said, it may well reach the point which would make the total of these allowances exceed the overall amount which I have subscribed to and used.

Q. Such a detailed program has been undertaken in the reproduction cost new estimates, has it not?

A. Not by me.

Q. Do you know of one instance where the Hope Natural Gas Company has paid taxes during construction?

A. No.

Q. You did not make a check of the constructed natural gas companies comparable to the Hope system, to determine
679-H what percentage of taxes during construction were actually paid?

A. There are no natural gas systems comparable to the Hope system, that I know of.

Q. There are none with that amount of investment?

A. No—but there are none with the complexity involved in the Hope system.

Q. Did you make any check of actual experience in the payment of taxes during construction?

A. The experience that I have had as to taxes during construction indicates rather less taxes than would be likely assessed in the east. Most of the construction that I have handled has been in the less thickly populated territories, where the tendency to tax property during the construction period is much less than it is in this part of the country.

Q. You have used other persons' knowledge for your basis?

A. No. I find that in my own experience with the smaller taxes that have been paid, the average aggregate amount of these undistributed construction costs is greater than the amount included here including taxes.

Q. Is it not customary to build pipe lines in the summer and the tax dates are usually in the winter, are they not?

A. I think so: yes.

679-I Q. On page 30, for interest during construction, you have used an 8 per cent figure. What rate of interest did you assume in determining your allowance for interest during construction?

A. I assumed no specific rate of interest. The 8 per cent may be, in fact it is the composite result of a great many factors. If as is sometimes assumed, that the average time that money would have to be hired during the construction period was half of the construction period, that would mean that the money would be required for one and a half years, in which case 8 per cent interest during construction would be the result of a rate of about something over 5 per cent.

On the other hand, it is always necessary in constructing property by an independent corporation, without the benefit of a large operator, to borrow a great deal of money in advance of actual construction. In one case with which I am personally familiar, all of the money was made available before a dollar was spent for construction on a project that took 17 months to construct. If that were the case here, the 8 per cent might be for three years' use of the money.

On the other hand, a more common requirement is for from three to six months supply of money as being necessary to sat-

isfy the requirements of the bankers, and to establish
679-J the credit of the company.

That three months added to the one and a half years average time that might be required, would give a total period of 21 months, in which case something like 4½ per cent rate of interest would give you the final result of 8 per cent. Or, the property might be constructed in such a program that parts of it would go into operation a year or so after the beginning of construction, and some parts would be constructed well in advance and carried for considerable periods before they could go into operation, through natural limitations, so that it may be that the average time the money was used during construction would be a year in a project like this, plus the three to six months for the supply of money that it is necessary to have in advance, in which case the period that the money would be used would run from fifteen to eighteen months, in which case again, five or six per cent interest during construction might be required—and might give you the 8 per cent. Or you might be so fortunate as to be able to get your money in such a way that you would only have to hire it a year before you are able to begin operations, and then it would take an eight per cent rate of interest to achieve the eight per cent cost during construction.

All of those factors affect one another, and some of them act in one way and some the other, and the conclusion that
680 I have reached, after consideration of all of these facts, is that on a property such as this to be constructed over a three-year period, the interest during construction may fairly be taken as 8 per cent.

Q. Did you assume that this property would be constructed as a completely independently and publicly financed utility?

A. I did.

* * *

Q. Mr. Rhodes, did you make a study of what the cost of money would be under that assumption?

A. No; I did not.

Q. And I believe you did not state that you assumed any specific rate of interest to be used in the time of interest during construction?

A. That is correct.

Q. Mr. Rhodes, are the overhead percentages on page 30 of Exhibit 16-A the same as are used in the company's original cost exhibit, which I understand will be presented in this case?

A. No; they are not.

Q. Then you did not employ the Hope Company's expe-
681 rience to your estimate?

A. No; the Hope Company has the benefit of other experience, for which the Hope Company pays nothing and receives services from others for which Hope pays nothing. An independent company has to pay for all of those services.

Q. The company you have assumed would have no free services?

A. That is correct.

Q. And that is the only explanation for the difference between the overhead percentages you have used and the overhead percentages appearing in the original cost exhibit to be presented?

A. No. In determining the true original cost of the property, the overhead percentages to be used must necessarily be those that are reflected on the company's books. There is no way of reflecting the free services which they get. In the reproduction cost new, I have made my estimates on the assumption that nothing will be obtained free but everything must be paid for at the market price, or its equivalent.

Mr. Rhodes, did you list the free services which Hope Company receives?

A. Well, during this construction period, for instance, when money was required actively in large quanities, the money
682 was advanced as required, and no more than a nominal rate of interest was charged on the advances.

In many cases, Hope constructed its properties out of its own cash. Operators in the natural gas business, the large operators have had experience all over the country, and while the parent company in this case has made charges and does make charges from time to time, to Hope, those charges include bare out of pocket costs that are incurred by the parent companies that are readily discernible, without any charge whatsoever for the knowledge and production power that makes it possible for them to carry out these projects.

I know from experience that these so-called "overhead costs" are less when the owner of the project is a large operator.

Q. Mr. Rhodes, will you please refer to page 34 and 35 of Exhibit 16–A. On page 35, your estimate shows $14,296,600 for undistributed construction costs. Will you state the application of those costs to each of the accounts listed on pages 34 and 35?

A. I made no such application except to the sum total of all of these costs.

Q. On page 34, Mr. Rhodes, account No. 330-1, Natural Gas Producing Lands, did you apply overheads to that?

A. Yes; I have spread the overhead over all of the expenditures because that is the manner in which I have learned
683 what percentages are required to cover all of the expenses of the company.

Q. Account No. 330-4, Rights of Way, did you apply overheads to that?

A. Not specifically, but as a part of the aggregate costs of the property, yes.

Q. Account No. 330-5, Other Land and Land Rights.

A. The same answer.

Q. Account No. 334—Drilling and Cleaning Equipment. Did you apply overheads to that?

A. The same answer.

Q. Account 337—Other Production Equipment?

A. The same answer.

Q. Now, on the Transmission Plant account, 351-12, Land, you made the same allocations?

A. I have made no allocations. I have merely applied the allowance percentage to the sum total of all of the construction. I have made no attempt to spread it over details.

Q. That would be true of account 354-4—Other Transmission System Equipment?

A. That is right.

Q. And under General Plant Jointly Used, on page 35, Account No. 370—Land and Land Rights, the same is true there?

684 A. Yes, sir.

Q. Account No. 372—Office Furniture and Equipment? The same answer?

A. That is right.

Q. And the same for all of those except Account 378—Communication Equipment, listed in the general plant, jointly used?

A. I applied one overall percentage to the sum total of all of the prime construction costs.

Q. Was there a separate calculation made for interest during construction?

A. Not for the purpose of arriving at the sum total. It may have been made in the working papers as an incident but not as a part of getting the final answer.

Q. Mr. Rhodes, on page 35, you captioned the account, General Plant Jointly Used: Does that mean that that plant is used by Hope with other companies?

A. "Jointly used" refers primarily to property that is used jointly with the distribution department.

Q. Does Hope Construction and Refining, River Gas Company and Reserve Gas Company, as of the date of this exhibit, use any of the plant listed under "General Plant Jointly Used?"

A. I don't know the extent to which such use is actually made. I do know, however, that charges are made by Hope to
685 these companies for administrative costs, which cover any use that might be made of the building by those companies.

Q. No segregation of the property used by other companies than Hope appears in your exhibit?

A. No; there is no segregation.

Q. Mr. Rhodes, has the Hope Company charged to expense the items you list on page 30 as overhead?

A. They have in the past failed to charge them to construction, as they should have done, and are now charging them all to construction.

Q. But in the past they have charged those to expense, have they not?

A. In effect; yes, sir.

Q. And then, is there not a duplication in these overheads, if they are placed in new reproduction costs in an estimate that might enter into the determination of a rate base?

A. Not if the rate statement properly reflects the fact.

Q. There will necessarily be an adjustment, will there not?

A. The rate statement must necessarily reflect the charging to construction of these items of expenses.

Q. In your reproduction cost new estimate, Exhibit 16-A
686 to I, inclusive, you reproduced all of the property of the Hope Company?

A. No.

Q. What have you excluded?

A. Property used solely for distribution of gas.

Q. Could you list that property now?

A. I think it is adequately listed in that statement. I have made no separate listing of the property used solely for distribution.

Q. Then your exhibit includes all of the property owned by the Hope Company, other than what you term "used in distribution?"

A. All of the physical properties. It does not include securities and things of that nature that it owns.

Mr. COCKLEY. And it does not include leaseholds?

The WITNESS. No; that is correct.

Mr. COCKLEY. And the coke oven gas plant?

The WITNESS. Furthermore, it does not include working capital in the form of stores, materials and supplies.

By Mr. SPRINGER:

Q. Is all of the property which you classify as natural gas production plant used in rendering services in interstate commerce?

A. To some extent.

687 Q. Do you know the principal use of it?

A. The principal use is for the production of gas for export from the State of West Virginia.

Q. How did you determine that? Did you make a flow study?

A. You do not need to make a flow study. It is perfectly obvious that with so many billions of cubic feet of gas being measured at the Ohio River with the pressures as I know them to be lower on the other side of the river than they are on this side of the river, that that amount of gas went out of the State of West Virginia. I know the same thing is true, that the Brave station for delivery to People's Company, it is fairly obvious from the location of the meters, what gas goes out of the State. It requires no flow study to accomplish that result.

Q. Do you know what property is used in rendering gas service in interstate commerce?

A. Not specifically.

Q. What was the basis for your exclusion of what you term distribution property?

A. Gas distribution property is not used at all in interstate commerce. It is purely within the State of West Virginia.

Q. How did you determine that?

688 A. It is obvious.

Q. Is it?

A. Yes.

The TRIAL EXAMINER. How did you determine what particular properties were used for that purpose? That would not be obvious, would it?

The WITNESS. It is obvious that the distribution mains in the City of Clarksburg are not used in interstate commerce at all.

Similarly the distribution mains in Parkersburg or in Weston or the shops in those particular towns that have to do with the distribution meters—that is property that is solely used in the distribution of gas, and must necessarily be wholly within the State of West Virginia.

Q. Then did your exclusion of what you call local distribution property end at the city limits? How about the feed lines for local distribution property?

A. Those feed lines for local distribution properties may be transmission lines or they may be in fact field lines, depending upon where the gas goes in the line that is delivered to the city gates.

Q. Did you make a study to determine that classification?

A. I made no study to determine what little lines here and there around the system might be solely used to deliver gas to individual consumers.

689 Q. Do you know the use made of the long line from Sheriff Meek's station to Richmond?

A. It is used to transport gas to Richmond.

Q. For local distribution?

A. Yes; that is local distribution.

Q. And is that included or excluded in your reproduction cost estimate?

A. That is included.

Q. Included?

A. It is.

Q. Is any of that used for gas service in interstate commerce?

A. It is impossible to make a segregation except in isolated instances, of property that is used solely for one thing or solely for the other. With very few exceptions, and that is one which you have mentioned, the transmission properties of the company are used jointly to a relative indeterminate extent for the export business and the local business.

Q. Are you prepared, Mr. Rhodes, to state the extent and purpose of the use of each unit of property you have included in your reproduction cost new estimate?

A. In the broad aspects, I know what all of the property is used for. When it comes to the use of some insignificant piece of property, my memory probably would not serve, but

690 I am familiar with the use of the property in this system, and the manner in which it is operated.

Q. Did you make a study or was there a determination of the usefulness of the property you have inventoried given to you as the basis for your estimate?

A. When the field inventories of this property were made by me, I was supplied by my men with a list of items of property concerning which they needed further information as to their use. Those items of property were brought in to me and I considered these items and discussed them with the management of the company. If they convinced me that these items of property were used and useful, I included them in the reproduction cost new, and made no special consideration of them when I determined depreciation. If I disagreed with the management, in reproduction cost new less depreciation, in general I depreciated the reproduction cost to the warehouse value of that equipment, for movement to some other location as it might be needed. There was very little property concerning which there was any question as to its usefulness.

Q. You were convinced that most of the property was used, were you not?

A. I was, and I made other analyses to determine whether it was used.

Q. Could you list the property that you eliminated as
691 not used or useful?

A. The working papers show it. There are a number of items wholly unimportant in the aggregate.

Q. You state on page 11 that the items of property covered by your reproduction cost new estimate has been classified in accordance with the 1939 West Virginia System of accounts. You know that system of accounts has a functional division of utility plant accounts, entitled "Storage Plant" do you not?

A. There are two questions you have asked me. My answer to the first question is that this classification was made by the company.

The second question as to storage plant, I know that there are certain wells of this company that are filled up with gas in the summer and from which gas is withdrawn during the winter. Whether those are properly classed as storage plants or wells, as they are classed in this reproduction cost new, is a matter that have been determined by the management of the company as the proper classification of this character of property.

Q. Then you have reproduced as active producing wells, storage property?

A. I have called as active producing wells these wells which are filled up in the summer and actively drawn
692 upon during the winter. They are not just idle storage wells at all: they are used in very important functions of carrying the peak load such as we had last January, and without which, I think, there would have been a serious shortage of gas.

Q. Without a classification in accordance with the West Virginia System of Accounts?

A. Quite aside from how they might be classed, they are not idle property; they are active property, that are more properly determined as to cost and value as wells than they are as storage holders, which of course they are not.

Q. Do you have in mind the names of the pools which are used as reservoirs?

A. Primarily, the Bridgeport pool is the principal place where gas can be stored in the summer and withdrawn in the winter. I know that other operations are now being carried on experimentally.

Q. Do you know of any other reservoirs used, as of December 31, 1938?

A. I do not recall any other reservoirs in active use for the purpose.

Q. Will you please turn to Exhibit 16-B on page 2. You have summarized there the natural gas producing lands owned by the Hope Natural Gas Company in the amount of $2,275.

A. Yes; I have.

693 Q. And the page following that, are those lands owned in fee or are they interests by lease?

A. I have not examined the deeds, but information was furnished to me that that is land that is actually owned in fee, the use of which is shown on page 3 of Exhibit 16-B.

Q. Does the amount which you have set out opposite each parcel of land represent your estimate of the present market value, or does it represent the actual amount paid by the Hope Company?

A. It represents the original cost before the application of overheads.

Q. And you have captioned it "Value?".

A. Yes.

Q. Is any of the property listed on page 3 used in rendering gas service within the State of West Virginia?

A. It is used jointly with other property in rendering service within and without the state.

Q. On page 6, you show a summary of field and trunk lines, rights of way, in the amount of $772,814. On the field trunk lines, you have used a unit cost of $1.75 per rod. On the field gathering lines you have used .95 cents per rod. Do you have your working papers here now?

A. I do not. The working papers that we were bringing here, I might state were for unit cost development. I am
694 not sure that those particular working papers would appear in the unit cost development or in the general working papers, which is a stock as high as this room.

Q. Can you tell us how the unit cost was developed?

A. I can. I had a study made of the cost per rod of all rights of way purchased by the company which still exist. These costs were classified in the records which were available to us as between trunk lines and gathering lines. No attempt was made, on account of the volume of the work involved, to segregate any of these lines as between sizes, that not being necessary, as the basic information was the cost of the rights of way still held.

It was found that in the early period of the development of the company up to about 1910, the costs were low and growing.

From 1910 up to 1930 when the depression struck us, the costs were fairly reasonably uniform, from five year period to five year period, and beginning with the depression, when people were no longer buying rights of way, the cost per rod began to fall quite rapidly. It was in accordance with my own experience in buying some thousands of miles of rights of way that the greater the activity in buying the rights of way—the shorter the time you had to buy 100 miles, for instance, the more
695 you are going to pay for it, and based on those experiences of my own and the company's experiences in the twenty-year period of active development, I arrived at the unit costs separately for field trunk lines and gathering lines, which I rounded out to the nearest five cents per rod, which is as close as it can reasonably be determined.

Q. How much is in that $1.75 unit cost for the rights, and how much for acquisition, and how much for damages?

A. I have made no attempt to break down the total original cost. The original cost working papers which serve as the basis for these figures will disclose all of the information that is available. In the actual purchase of rights of way we do not,

in our own thoughts, distinguish as between the price paid for the right of way and for the damages. The division is often arbitrarily made to suit the ideas of the farmer, or for other reasons, the division might be changed, so we think in considering the purchase of rights of way that it is going to cost is $1.00 a rod or $2.00 or $3.00 a rod as the case may be.

Q. Why should field trunk line unit costs be more than field gathering lines?

A. Because they are bigger lines is the prime reason, and they perform a more important function, which generally leads to the necessity of paying more for the actual rights of way.

696 Q. The rights are identical, aren't they?

A. No. A larger, wider right of way is required for the larger lines.

Q. Does not the Hope Company have a standard right of way form which is used?

A. I assume they do; I do not recall having seen it.

Q. And that would specify a uniform width right of way, I take it?

A. Not necessarily. In buying rights of way, the width is specified to meet the particular needs of the situation.

Q. Will you furnish the detail of the development of the unit cost?

A. To what do you refer?

Q. Of the $1.75.

A. Where the $1.75 came from or the details of my original cost working papers?

Q. If you will just furnish an example of how you built up that unit cost, that will be satisfactory.

A. Well, the unit cost is $1.75 per foot and that is the average price paid by the Company for all of the rights of way purchased from 1910 to 1930, rounded out to the nearest five cents per rod. It is just an actual division of the total dollars by the total rods, determined from the original cost working papers before the overheads were applied.

697 Q. Will your working papers reveal voucher reference and total rods and the money paid by Hope?

A. The voucher reference can be found only in the original cost working papers.

Q. You have listed on page 6 of Part B of Exhibit 16, 87 railroad crossings at a unit cost of $75 each. Does this represent the actual price paid to the railroad company for the privilege of constructing lines under their tracks?

A. The figure of $75 was arrived at by averaging the cost of a considerable number of railroad crossings purchased by the Company, and reflects the actual original cost before overheads. It includes not only what was paid to the railroads, but what other costs might be involved in securing the right to cross the railroads.

Q. Did your analysis cover the same period as the rights of way?

A. We used the same records.

Q. The same period?

A. The information was obtained at the same time that we obtained information as to the cost of rights of way purchased.

Q. Does it cover the same period of time?

A. I do not recall the exact period of time covered by the rights of way, but we studied information as to all of the
698 railroad crossings, of which we were able to find records, in the original cost development.

Q. Will you please turn to page 8. You have listed here a summary of "Other Land and Land Rights, Account No. 330-5," in the amount of $21,045?

A. Yes.

Q. And the details follows?

A. It does.

Q. Does each of the amounts for each of the items listed in this account represent the cost paid by the Hope Company for this property?

A. It represents the original costs before the application of overheads.

Q. And what do you mean by "original cost"?

A. The original cost is determined and reported on in a separate exhibit.

Q. And you have termed it "value" for the purposes of your study?

A. I have considered that original cost as the best available measure of the value of those lands.

Q. Will you refer to page 9, please, and the first item you have listed at the top of page 9 is land used for unloading pipe, valued at $749. Do you know where that tract of land is located?

699 A. Not without reference to maps, other than that it is located in Boone County.

Q. And do you know whether it is currently used?

A. As to whether it is used at the moment, I do not know, but it is used when active construction is taking place in that territory.

Q. Do you know the last time it was used?

A. I have not investigated it.

Q. Did you make a check to determine whether it was used during 1958?

A. I did not make such a check, no.

Q. You accepted the original cost from the books for the purposes of this study?

A. That is correct.

Q. Without making any investigation?

A. The original cost, as determined from the books.

Q. Without making an inspection of the use of the property?

A. I did not inspect the use of each individual piece of land or other property.

Q. You have listed under Harrison County, land used for dwelling sites at McWhorter. Do you know if that property was sold about a year ago?

A. No.

700 Q. And you have listed under Harrison County the use of land for warehouse, amounting to $302.

A. Yes.

Q. And you had that as .292 acres.

A. That is right.

Q. Isn't that approximately $1,035 an acre?

A. Approximately.

Q. Is that not a high price for farm land?

A. It is what the company had to pay for the land.

Q. And you think that is the market value of the land?

A. It is the best evidence of market value. I know from my own experience that when you want a particular piece of land you pay what the farmer wants and not what you think you ought to pay.

Q. There is another item on page 9. You have listed .037 acres comprising an office building—on which an office building at Bridgeport is located, at $1,203. That is approximately $35,000 an acre, isn't it?

A. Approximately.

Q. Do you know where that building is located and the size of it?

A. I don't recall. I know only that that is what the company paid for the land.

Q. Was it purchased from the Bridgeport Gas Company?

701 A. I don't recall the details.

Q. Do you know how much of that property is used in rendering gas service within the State of West Virginia?

A. No.

Q. Do you know that the major use is for local purposes?

A. No.

Q. On page 9 you have listed three pieces of property located at Salem Station. Is that the storage yard for the Salem district?

A. It could be so used. The extent to which it is so used, I do not recall in detail.

Q. Do you know how much use the Hope Construction & Refining Company makes of that storage yard?

A. No.

Q. Do you know that there is a gasoline plant adjacent to that?

A. Yes.

Q. And have you made any allocation between the use of property listed in your inventory by companies other than the Hope Company?

A. No. Any such use that is made of that property and is charged for, is reflected as a reduction in expense in the rate statement.

Q. On page 10, you have listed 19 acres used as Regu-

702 lator Dwelling and Pipe Yard, in the amount of $603?

A. Yes.

Q. Do you know where that property is located?

A. Not specifically.

Q. Are you sure there is such a property?

A. Such a property was so located in the determination of original cost, and it is reflected by deed No. 45,033 in the records of Harrison County.

Q. All through this statement you have accepted the inventory of men who made the original cost statement, is that right?

A. No. As to the things like land, yes, but the inventory used in the original cost statement was used as a basis for the inventory which was priced here. As to operating units of property, the units are identical.

Q. Will you please refer to the third item on page 10 and described as "Storage purpose at former Aizpuru Station." Do you know what that property is used for?

A. Storage purposes.

Q. Do you know what is stored on that land?

A. No; I have not seen it.

Q. Do you know that the property was purchased?

A. The original cost records show that the property was purchased and it cost $202 before the application of over-
703 heads.

A. Do you know that the property was abandoned?

A. I don't know whether it was abandoned or not.

Q. Would you please define the operating units of property to which you have referred.

A. I will refer to it by example. First, Line H-192 is an operating unit of property. I consider each of the compressor units, for instance, each compressor unit, as an operating unit of property. Each identifiable piece of machinery is an operating unit of the property. Per contra, I do not consider a valve in a pipeline as an operating unit of property. It is a part of a unit. A building is an operating unit, as I use the words.

Q. Thank you. Now, on page 10, will you refer to the item listed as "Warehouse and Office at Gilmer." Do you know what part of that property is used by the Hope Construction & Refining Company?

A. No.

Q. Do you know what part of the property is used in rendering gas service within the State of West Virginia?

A. No.

Q. Well, where could we get the answers to these questions?

A. From the management of the company.

704 Q. From the management?

A. Yes.

Q. There are not any other exhibits prepared by you which may be subsequently presented which show the use of the property which you have listed?

A. I have made no allocations of this property.

Q. Referring to page 10 again and the item "Storage Yard and Barn at Mannington," under Harrison County, do you know what use the Hope Construction & Refining Company makes of that property?

A. I do not.

Q. On page 11, Mr. Rhodes, in the item "Office and Storage Warehouse at Ellenboro" in Ritchie County, was that office in use on December 31, 1938?

A. I was not there on that day, so I cannot state.

Q. You have relief on someone else's statement, haven't you?

A. Of necessity.

Q. And you don't know whether it is there at the present time or not?

A. If I recall correctly, it was there a few years ago when I was in Ellenboro myself, but I did not pay any attention as to whether it was in use or not.

Q. And you don't know how much use is made of that
705 property by the Hope Construction & Refining Company?

A. I do not.

Q. Do you know how much of that property, as of the date of your exhibit, the Reserve Gas Company used?

A. I do not.

Q. You knew that Ellenboro was the central point for the Reserve Gas Company, didn't you?

A. No; I have not considered the Reserve Gas Company at all.

Q. The next items you refer to, Warehouse and Office at Littleton, in Wetzel County—do you know what part of those tracts are used by the Hope Construction & Refining Company?

A. No.

Q. Nor what part is used for the local distribution?

A. No.

Q. Then to summarize this whole account, you are not sure that those items of this account totalling $21,045 should be assessed against the operations of the Hope Natural Gas Company? Well, you have already answered that "No" in detail.

The WITNESS. I do know from my organization that these tracts of lands are owned by the Hope Natural Gas Company, and carried by it in its production land account and is
706 considered by it to be used and useful in its business, which is primarily the export. I do know that when my men went around examining the property they did not call to my attention any of this property as being doubtful as to use. Under those circumstances, I have relied entirely upon the fact that the property is Hope Company property and is used and useful to it in its business.

Q. Then if any errors were made by any of the persons on whom you have relief, it is reflected in your reproduction cost estimate as to the usability and usefulness of the property?

A. There are not necessarily any errors. The management considers the property to be used and useful, and on such insignificant items of property I did not consider it necessary to give

personal attention or give any particular detailed consideration of these small items, that might be left out without any measurable effect on the answer.

Q. But we have only covered one account. These insignificant items may become great in the final answer, may they not? It is conceivable, is it not?

A. It is inconceivable to me, being generally familiar with this property, that there is any considerable amount of money represented in any kind of property but what is fully used and useful.

707 Q. But you have made no allowance for what you call the insignificant portion——

A. (Interrupting.) I say there can be no aggregate amount of insignificant things that is an important factor in the total over-all cost of this property.

The TRIAL EXAMINER. Were your men instructed to call to your attention any items where they questioned the allocation of the items already made by the company?

The WITNESS. In general they were not instructed to question allocations. In some cases we did that, but in general their instructions were only to call attention to any property which they could not see was being used by the company.

The TRIAL EXAMINER. So that in general the allocation was made by the company and not made by you or your men?

The WITNESS. That is so.

By Mr. SPRINGER:

Q. How would you make an allocation in expenses and income relating to the property that is jointly used by Hope Construction & Refining Company and the Hope Natural Gas Company?

A. I have not made any such allocation.

Q. Well, it is necessary, to be consistent, is it not?

A. If charges are made for the use of property or for services performed by Hope for these other affiliated companies, those charges may well cover all of the services performed,

708 even the use of property. It is entirely consistent.

Q. But does it cover the use of property?

A. In the opinion of the management, it covers all of the services performed.

Q. Is there one person in the management of the Hope Natural Gas Company on whom you relied for the statement of whether

items of property were used or useful and the extent used by the Hope Natural Gas Company?

A. These points to which I called attention were generally settled in a conference which was attended by Mr. Tonkin, the president and Mr. Chisler, their treasurer, and sometimes their assistants.

Q. Will you please refer to pages 19 to 24, Field Measuring and Regulating Station Structures, 588 regulator and meter houses, and 1,481 free consumer boxes. Are any of these houses or boxes used in connection with regulating or measuring gas sold to consumers in West Virginia served from the field lines?

A. I have not investigated the detailed locations of these respective regulating structures. Necessarily they regulate the pressure of the gas passing from a high pressure line to a low pressure line, if they are regulators. In most cases they are meter houses.

Q. Will you turn to page 28, please. The first item
709 that you have listed there is the Bridgeport Office, which you show at $3,197?

A. That is right.

Q. You have indicated that this is a type 37 structure?

A. That is right.

Q. Are you able to give us the breakdown of the unit cost of the 23.6 cents per cubic foot?

A. Not as between all of the items entering into the construction of that structure. Type 37 structures are structures as described here in a general way. A group of the Type 37 structures were priced in detail, these structures containing different volumes in cubic feet, and from the average cost, or from the cost per cubic foot of the structures of various sizes, the appropriate price per cubic foot was taken for structures of intermediate sizes. It is well known that a small structure of a given type costs more per cubic foot than a large structure of the same type, and that is reflected in this pricing. The unit cost development shows the full details of how this price per cubic foot was arrived at.

Q. You do not have that unit cost development set of papers with you now?

A. I don't know whether it has arrived yet or not. I do not have it with me now.

710 Q. You could furnish us an example of the composition of that unit cost, couldn't you?

A. I could furnish you with an example showing just how that unit cost was arrived at.

Q. Will you be able to do that after the noon recess?

A. I will have one of my assistants determine that for me.

Q. How did you measure this Bridgeport office building? Did you take the inside or outside measurements?

A. Generally outside measurements are used in the measurement of a structure for determination of its volume.

Q. Were you consistent? Did you use outside measurements all the way through?

A. Outside measurements were generally used. I know of no exception.

Q. Do you know what use is made of the Bridgeport office in rendering gas service within West Virginia?

A. It is used as the office in the Bridgeport production district.

Q. Is it the accounting office for the City of Bridgeport?

A. I don't know whether it is in that building or not.

Q. On page 25, you show a unit cost of $0.214 per cubic foot for item No. 3, Office and Warehouse, Bridgeport, but for the same type of structure it Item No. 1, office at Bridge-
711 port, you have used a unit cost of $0.236. What is the explanation for that difference?

A. I have already explained that the large building costs less per cubic foot than the small building, if they are of the same type.

Q. That will explain any of the differences throughout this study, where structures of the same type but a different cost per cubic foot are shown?

A. That is correct.

Q. Do you know what use the Hope Construction & Refining Company makes of the structures at Bridgeport?

A. Primarily in the operation of the Bridgeport District for the producing of gas.

Q. I said the Hope Construction and Refining Company.

A. I beg your pardon. I don't know what use the Hope Construction Company makes of it.

* * *

713 Q. Will you please refer to page 30, and referring to Miscellaneous Improvements, $2,324, can you list for each structure the miscellaneous improvements, which you have added as an arbitrary 15 per cent to the cost of the structures themselves?

A. The working papers disclose the list of such details which if typed in a case of this kind with respect to each building would take pages of this typed matter for each account.

714 We set up the details which we had available, and to avoid that complication, we found that these particular structures by districts had differing amounts of miscellaneous construction about them, innumerable items, and that as related to this Bridgeport District we found that 15 per cent fairly represented the cost of those miscellaneous items. The details are available in all of the enormous volume of the working papers, if you care to examine them. The amount being small, we preferred to reflect the average practice of the Company in such matters, which, as related to this Bridgeport District is fairly represented by 15 per cent on the cost of the structures. It is an unimportant total amount which I say would have taken pages and pages of detail to price separately.

Q. We are just seeking an example of each one of these. We would not necessarily advocate the placing of the details in the exhibit, but we would like to know just how these are arrived at. Is it a coincidence that on page 30, Miscellaneous Improvements, priced at 15 per cent of the cost of the structures is the same as on page 35, Miscellaneous improvements, priced at 15 per cent of the cost of the structures for the different districts, Buffalo and Bridgeport?

A. We studied the details of these improvements, in order to avoid complicating the record with a lot of unimportant
715 detail, we found that these various districts might be grouped into classes which contained relatively few miscellaneous improvements, and other districts where they contained a considerable amount of miscellaneous improvements. We priced in detail two typical districts of each of the groups. The Buffalo District and the Gilmer District were priced in detail and showed over 17 per cent as to the cost of these miscellaneous improvements. They were put in the 15 per cent class with the other districts, the names of which I do not have available.

We found other districts, like the Calhoun and Mannington Districts had more of these miscellaneous odds and ends which totaled up to about 25 per cent, and we priced Calhoun and Mannington in detail and found that there was more than 25 per cent represented in these structures, and we used 25 per cent for Calhoun and Mannington, and others which we found had that complexity in miscellaneous details. Salem and Shirley were districts where there was a great deal of this detail, and we found that 45 per cent was a figure that fairly represented the cost of these miscellaneous structures in the Salem and Shirley districts, and others that came in that class.

The method that we arrived at for these percentages is as explained by me, and actually reflects the Company's practice in those miscellaneous odds and ends of construction,
716 but which, after all, represents a comparatively small amount of money.

Q. Do you mean 45 per cent of a piece of property would be miscellaneous improvements?

A. Well, in $100,000,000. worth of property, $5,000. worth of property in the Shirley district is an unimportant item, particularly when we used 45 per cent and found it was actually 45.2 per cent.

Q. How much does the miscellaneous improvements amount to in the aggregate of the valuations?

A. I have not figured that out.

Q. It is a substantial amount?

A. No, because these particular accounts to which it applies are quite unimportant accounts in the aggregate.

Q. Is it more than $100,000?

A. I have not the slightest idea how much it is, but I may say that the specific percentages we used were the percentages actually determined from the company's cost of property, and it was done that way to save space and save thousands of dollars involved in this infinite pricing of small items.

* * *

717 Q. Mr. Rhodes, will you define "unit cost?"

A. Unit cost is the cost of providing a unit of the particular thing or commodity involved.

Q. Will you please refer to page 4 of Exhibit 16-C.

A. I have it.

Q. Will you please describe the detail development of unit cost of .771 dollars for 6⅝-inch nominal diameter, South Penn casing, weight 20 pounds per foot, of which there are 4,553,783 feet in the Hope system?

A. I would be glad to do so, but I must have my working papers from which this determination was made.

The TRIAL EXAMINER. Are the working papers here?

The WITNESS. Yes.

* * *

720 Q. Referring to the question I asked, will you please describe the development of the unit cost for South Penn casing?

A. On page 4 of Part C of Exhibit 16, the unit price is shown for 6⅝-inch South Penn 20 pound casing as 77.1 cents per foot. That price comes from the working papers, and was arrived at as follows—this particular size and weight of casing is one of the so-called tonnage items upon which the mills quote a lower price than the non-tonnage items, and their price quoted to us was 71.54 cents per foot f. o. b. Pittsburgh. This 71.54 cents per foot is subject to a cash discount of 2 per cent, which brings the net mill price to 70.11 cents per foot. The freight from Pittsburgh to the average West Virginia destination was found to be 22 cents per cwt., which, applied to the 29 pounds per foot results in a freight cost of 4.4 cents per foot, making a total delivered cost of 74.51 cents per foot of pipe delivered.

In order to include all of the costs involved in purchasing and checking and warehousing of a part of this casing that is always necessary, we have added a miscellaneous material cost allowance of 2.61 cents per foot, which is 3½ per cent, bringing the
721 total cost per foot of this casing as found in the well, to 77.12 cents per foot. We eliminated the .02 cents, using the figure of 77.1 cents per foot, as shown on page 4 of Part C of Exhibit 16.

Q. Mr. Rhodes, how did you determine 3.5 per cent for warehousing and miscellaneous?

A. That is a matter of judgment and experience in handling materials of that kind, and I would call attention to the fact that whenever a well is drilled, more casing and tubing is sent out than the actual amount expected to be finally required in the well, because of unknown conditions that are likely to be encountered.

Generally speaking, the material for a well is ordered out at one time and shipped, but 20 to 30 percent and sometimes 40 per cent additional material is taken out of the same local stock to supply this working additional amount. That involves warehousing.

And of course, there is the purchasing, which purchasing is generally requisitioned and specifically for each well, to fit the needs of that well.

As I pointed out yesterday, casing and tubing is not purchased in bulk quantities and drawn upon as is the case of line pipe.

Q. Will you please refer to page 5 of Exhibit 16, Part C. And may I digress for a minute? Does that 3.5 per cent
722 apply to all casing or just to a particular size?

A. We applied 3.5 per cent to all casing and tubing.

Q. Now, on page 5 of Exhibit 16, Part C, Closing-in Equipment, wells with one producing string, the unit cost is $66.73. Will you please explain the development of that unit cost?

A. This item of 2,300 assemblies of closing-in equipment at a unit of $86.73 covers the material only of a bill of materials which was found by analysis of about ten per cent of the wells to be used as the Company's average practice in connecting the tubing from the well to the lead line on the ground. This bill of materials and the unit prices which we have received for these materials—quotations for materials, plus freight, are as follows—there is one 6⅝ by 2 inch by 2 inch by 1 inch casing head that costs $14.11. Approximately one-third of the wells contain two tubing clamps for holding the tubing in place. The cost applicable to one-third of the wells being $3.10 per average well. Similarly on one third of the wells there is a 6⅝-inch casing clamp, one third of the cost being chargeable to each well in the amount of $3.26. There is also a set of anchor rods on the average for each three wells, the price chargeable to each well on the average being 81 cents. There is next one 2 inch
723 extra heavy malleable iron T per well at a cost of 79 cents.

Next is two of the one-half inch blower flange per well cost $1.89. Then there is next a 10 inch by one-half inch nipple, costing 49 cents and next a nipple 11 inches long costing 22 cents and another two-inch nipple, 17 cents, a five-inch nipple, 11 cents, a half-inch nipple, six inches long, costing 4 cents. There is a two-inch plug, costing four cents, two half-inch plugs costing 2 cents and then there is a two-inch gate valve, Ludlow No. 9, reflecting average practice, at a cost of $57.38.

There are two of these two-inch gate valves at a total cost of $57.38. There is a half-inch stop valve in the blow-off costing $1.40. The sum total of the purchase price of these materials plus freight is $83.80. There is added $2.93 for purchasing, warehousing and other miscellaneous material costs, bringing the total up to $86.73.

In the working papers, but not available to me here, now, is a sketch which shows the manner in which this bill of materials is connected up between the well and the lead line to the gathering system.

Q. Have you indicated the percentages of the components of the unit cost?

A. I have shown only the dollar amount of the components.

Q. You do not have the percentage of materials?

724 A. This is all materials in this case. The labor is included in the cost of drilling the well and installing the casing and tubing.

The TRIAL EXAMINER. Will you speak a little louder, please, Mr. Springer? We cannot hear you very well.

By Mr. SPRINGER:

Q. What percentage of material overheads are applied on the materials?

A. Miscellaneous material costs are applied in the amount of 3½ per cent as was explained before for purchasing, warehousing and checking receipts, contingencies, and omissions, and so forth.

Q. On page 5 of Exhibit 16, Part C, will you please describe the development of the unit cost for Miscellaneous equipment for wells with one producing string and the unit cost you have used is $121.29.

A. The pricing of the miscellaneous equipment in the well was a complete pricing of approximately ten per cent of the wells in each class of producing strings. The list is several pages long for each district, but it consists of packers of various kinds and shapes, and casing shoes and plugs, and a hundred and one details, most of which are small. These wells having one string that were priced aggregating 228 wells. Every item of mis-

725 cellaneous equipment in those wells was shown by the well record and was priced at an aggregate amount of $27,653.88 including the same 3½ per cent of miscellaneous material costs. And the average cost per well was arrived at by dividing that total by 228 wells which gave the $121.29.

Q. Mr. Rhodes, is there a percentage of material and miscellaneous overheads applied to that miscellaneous equipment unit cost you just spoke about?

A. I don't follow what you mean.

Q. The former accounts for which you described unit costs had a 3.5 per cent figure for material and miscellaneous overheads. Is there such an element in this figure of cost?

A. I have already explained that there was a 3½ per cent allowance for miscellaneous material costs included in this unit cost per well.

Q. Will you please refer to page 6, Exhibit 16, Part C, account No. 332–2, 25 horsepower gas engines, and you have used the unit cost of $2,057.48. Will you describe the development of that?

A. This item of pumping equipment of 25 horsepower gas engines is comprised of the following bill of materials—one 25

horsepower gas engine which we have priced as a Cooper-Bessemer gas engine, at a cost delivered of $1,289.16. There is a ten-inch belt, 90 feet long on the average, at a cost of $77.40. There is a $15 item for T-frame and swivel connection, and an $8.25 item for 7/8 inch wire rope clamp. An $18.80 item for an oil saver with upper and lower stuffing box. There is an item of $556.50 for a 7/8 inch wire cable, on the average, 3,500 feet long. There is an item of $2.70 for a 7/8 inch rope for the wire line. There is an item of $27 for three pumping sinkers 1 3/8 inches in diameter and 15 feet long. There is an item of $2.15 for a valve rod, 7/8ths inches in diameter and 7 feet long. There is an item of $11.90 for a working barrel 2 inches in diameter and about 8 feet long and an item of $8.28 for one set of upper and lower valves, 1 3/4 inches in diameter. The total amount of these items delivered is $2,017.14. To this is added a miscellaneous material cost of 2 per cent which we use for miscellaneous machinery, bringing the total cost to $2,057.48.

Q. Please refer to page 107 of Exhibit 16, Part 1, captioned "Pipe, Steel, Lapweld Screw."

Will you describe the development of the material unit cost of .148 for 2 3/8ths inch O. D., weight 3.75 pounds per foot?

A. The unit cost of 2 3/8ths inch, 3.75 pounds screw-coupled steel pipe, Lapweld, as shown on page 107 of Part C of Exhibit 16, as 14.6 cents per foot. This was arrived at as follows:

727 The manufacturer's quotation f. o. b. mill in the Pittsburgh district was 15 cents per foot, subject to a discount to large purchasers of ten per cent, and two per cent successively. Applying your discount resulted in a per-mill price of 13.23 cents per foot. For this class of material, the average freight rate was 22½ cents per 100 pounds, applied to the weight of 3.75 pounds per foot resulted in a freight cost of .084 cents per foot, bringing the total delivered cost of the bare pipe itself as 14.07 cents per foot. To this was added miscellaneous material cost for checking, purchasing, receipting, warehousing and so forth, at 3½ per cent, the amount of which was .0494 per foot, bringing the total cost to 14.56 per foot. This was rounded out to the nearest tenth of a cent as 14.6 cents.

Q. Will you describe the development of the labor unit cost related to that item, .23?

A. In order to make it clear to the engineers for the various Commissions examining these working papers, I have had prepared an explanation of the determination of the unit price of

pipe line construction as related to another size of pipe than two-inch. It is a volume of some fifty pages of tables and charts and explanations that to translate into terms of particular sizes of pipe you asked for, would be quite impossible on the witness stand.

Q. Then you made a unit cost study of one size of pipe
728 as a base, and you have translated that to other sizes of pipe?

A. No; I made the unit cost development for four different sizes and all different kinds of pipe for all different kinds of construction conditions, and this explanation which we prepared and put into the working papers showed how that determination could be applied to a specific size of pipe for specific kinds and conditions that would be encountered on the average in the constructing of any particular kind and size of line. The size chosen was one representing a considerable amount of money, namely 12-inch Dresser-coupled line. I am at a loss to give you readily the development of the cost of the particular size you asked for. It would have to be prepared for me.

Q. Is the development of the unit cost for 12-inch pipe typical of the development for all other sizes?

A. Absolutely.

* * *

730 Q. Have you used different percentages in the development of material unit costs for the various sizes of pipe?

A. In general we have used 3½ percent on the sizes up to 6⅝ inches in diameter, where in general the lines are relatively short and involved a considerable amount of warehousing. The miscellaneous material cost is reduced to 2 percent on lines 8 inches in diameter and over, where in general the length is so great that a considerable portion of the material can be taken directly
731 from the cars to the right of way.

Q. Will you please refer to page 110 of Exhibit 16, part C, your unit cost of $4.35 for Dresser coupling, style 38 for ten-inch, nominal diameter 5/16ths by 7.

A. Without reference to the exact details, I think I can explain the unit cost completely. The $4.35 per coupling is made up of the manufacturer's quotation at the mill of $4.03 f. o. b. Bradford, Pennsylvania. The freight rate in this class of material is 31 cents per cwt. which applied to the average weight of 57 pounds gives a freight rate of 17.7 cents per coupling, making a total delivered cost of $4.207 per coupling. A miscellaneous

material cost which covers also the incomplete inventory in that the number of couplings was calculated at 20-foot spacings on the lines, amounts at 3½ percent to 14.7 cents per coupling, giving a total figure of $4.354 each, which we rounded out to $4.35.

Q. Will you please refer to page 113 of Exhibit 16, Part C and describe the development of the unit cost of $185.14 for drop assembly described as pipe drips, type 34, 10 inch by 33 feet?

A. These type 34 ten-inch pipe drips are made up of a bill of materials of approximately 40 items, and a list of about a
732 dozen items involved in the assembly and installation costs.

The principal items that enter into the construction is the main body of the drip, which is 33 feet of ten-inch pipe at a cost of $40.36. There is one 2-inch gate valve at a cost of $20.91. There are two special castings on the ends of the barrel, one of which costs $17.83 and the other $16.73.

The other items are odds and ends which bring the total specific cost up to $106.61, to which there is added a miscellaneous material cost for purchasing, warehousing and so forth of $3.73, which is 3½ percent, making a total of material cost of $110.34.

There are a number of items involved in the assembly such as threading and making up threaded joints of ten-inch, four-inch, two-inch and so forth, making up certain plans, joints and so forth, and handling the things in detail. The detail would show the labor cost directly expended of $33.

In this class of labor, work in assembling drips, we have found that miscellaneous construction costs involving the use of tools and gripping and machine tools in the shop and so forth amount to 50 percent, or $16.50. This drip weighs approximately 1,800 pounds, and for the cost of unloading and hauling it and stringing it and putting it into place in the ground we have used 14.1 cents per pound, which is the average cost of pipe for pipe
733 lines under easy construction conditions, making $25.30 for carrying the assembly drip out from the shop and putting it into place in the ground, making a total installation cost of $71.80. This, added to the total material cost of $110.34 results in a total cost of $185.14.

Q. Is that drip underground?

A. Almost entirely so.

Q. How did you get the inventories for that?

A. The inventory was obtained by examination of the records, drawings as to types of drips, by conversation with the men in the shops who built such drips, and information from the line

walkers, and so forth, and from which we determined the number of each kind and size of drip that are listed in the priced inventories.

Q. You mentioned special tools for the installation of drips. Could you give us an idea of what tools were used?

A. What I mean by special tools is this—these drips are generally made up in the shops, where you have to use pipe cutting and threading tools and machinery and wrenches, and so forth. I did not have in mind that tools for no other purpose were used, but the tool cost and use of shop equipment in this kind of work generally involves miscellaneous costs, including contrac-
734 tors' allowance of 50 per cent on pipe work. That is a common experience of pipe contractors, that to their direct labor cost they must add 50 per cent to give them their true costs, with the normal allowance for profit, and so forth.

Q. Is not welding employed more than the other type you have described?

A. Not on that particular type of drip. That particular drip is made up largely of screw pipe. The item immediately below is shown as welded drips. There is about the same number of welded drips, which are shorter, and are shown to cost less.

Q. Will you please refer to page 111 of Exhibit 16, Part C, under the caption, Terminal Valve Assemblies. There is a unit cost of $80.52 for valves, gate-flanged, Ludlow, 6-inch (c) of which there are 1117.

A. This unit cost is made up of one valve at a delivered price of $51.62. There are a pair of companion flanges at a cost of $4.30 and there is one plain end nipple at a cost of 51 cents, making a total cost of materials delivered of $56.43, to which is added 3½ per cent or $1.98, bringing the total material cost to $58.41.

The labor of assembling and installing these valves amounts to $11.50 for assembling, which comprises making up of threaded
threaded joints and nipple and connecting up the flanges to
735 the valve, making one welded joint, and the handling of the material and the assembly in the shop, amounting to $11.57, to which is added the miscellaneous construction cost as explained of 50 per cent in the amount of $5.79.

The installation of this valve was figured at 14 cents per pound as in the case of the drip previously described for 339 pounds, making a total cost of unloading it and hauling it out to the field and putting it in the line of $4.75, making a total cost of assembly and installation of $22.11, which added to the $58.41 material cost gives a total of $80.52.

Q. Do you know the list price and the discount on that valve?

A. I will look that up.

Q. May I ask whether your description of the development of the unit cost for this valve is typical of all the similar classes of property?

A. It is. It consists of the detailed bill of materials that are always installed together, whether it be a valve or a drip or a pair of orifice flanges or what not, there is in the case of each of these items a rather well-standardized assembly of materials, which is priced in detail both as to the materials themselves and as to the cost of threading pipe and installation following a uniform procedure.

736 In the working papers in general, sketches will be found that assist in following the details.

In determining the prices of valves, we found that this particular valve was a Ludlow 51⅝ valve and was quoted at $102 per valve, less 23½, 25, 10 and 2 per cent chain discount which applied to the $102, and gave a net price of $51.62 which was used in building up the unit costs of the assembly.

Q. Will you turn to page 260 of Exhibit 16, Part D and explain the development of the unit cost per foot of $1.013 8⅝ths inch 29.35 pounds per foot screwcoupled pipe.

A. This pipe is priced at a material cost of $1.013 per foot, which was arrived at as follows:

The manufacturer's quotation for carload lots was quoted to us as $1.0512 f. o. b. Pittsburgh. This for the large purchasers was subject to a discount of 10 per cent and 2 per cent, successively, bringing the net price f. o. b. the mill to 92.72 cents per foot.

The freight of 22½ cents per cwt. was applied to 29.35 pounds per foot, resulting in a 6.6 cents per foot freight cost and making a total delivered cost of this pipe of 99.32 cents per foot.

To this price was added miscellaneous material costs in the amount of 2 per cent or 1.99 cents per foot, making a
737 total material cost per foot of pipe in the amount of 1.0131 cents per foot which was rounded out to 1.013 per foot.

Q. Do you have a list price and discount for that type of pipe?

A. We asked the mill to determine for us the price per foot from their standard lists and so-called basic discounts, which they did. We started in each case from the mill quotation per foot.

Q. Do you know whether that included what you call a chain discount which you described for the valves?

A. It was subject to a discount of 10 percent and 2 percent, the 2 percent being for cash and the 10 percent being the large user's discount.

Q. Will you please refer——

Mr. COCKLEY (interrupting). Before you go ahead, I have just one question to clear the record, if I may?

These pipe prices you have been reading into the record here, Mr. Rhodes, do not reflect the fact which I think you have explained before, that there is an additional ten percent taken later on all of it, isn't there?

The WITNESS. That is true. These prices are the prices at which we have priced the inventory and which we had carried out, before we were able to reach any conclusion as to whether
738 or not an additional ten percent or other discount could be obtained. We don't know now that it can be obtained on any and all sizes. The conclusion I reached was that in the aggregate, a discount of ten percent additional could be obtained, which is the equivalent of 10, 10 and 2 percent discount from the mill price.

Mr. COCKLEY. If you were building up the unit costs then to reflect all of the discounts you have taken, you would have your ten percent, ten percent and two percent right in here, would you not, instead of having 10 percent and two percent, and then 10 percent more?

The WITNESS. It might have been done that way.

Mr. COCKLEY. As it is, you have 10 percent and 2 percent here, and then another 10 percent later on on all of it?

The WITNESS. That is correct.

By Mr. SPRINGER:

Q. Mr. Rhodes, will you please refer to page 261 of Exhibit 16, part D and explain the development of the unit cost for material of 2.338 for 20-inch pipe of 65.70 pounds per foot. You have a total cost of $3,692,251.

A. That total cost is for labor as well as material.

Q. I am just seeking the development of the unit costs for material.

A. The mill price of 20-inch, 65.70 pounds per foot,
739 lapweld plain end field pipe is 2.4309 per foot. Applying the large user's discount of 10 percent and the cash dis-

count of 2 percent results in reducing the net mill price to 2.1441 per foot. The freight cost of 22½ cents per cwt. is 0.1478 per foot, making a total delivered cost of the pipe itself 2.2919 per foot.

Adding to this a miscellaneous material cost of 2 percent, which is 4.58 cents, this brings the total material cost per foot of pipe in the ground to 2.3377 per foot. This was rounded out to 2.338 per foot.

Q. Now, please refer to page 262 of Exhibit 16, Part D, and describe the development of the unit cost per foot for material amounting to 1.710 for 12¾ outside diameter inches of welded pipe at 49.56 per foot?

A. This pipe in question, is plain end seamless pipe which is made up into a welded line, the pipe itself being 12¾ inches outside diameter, and weighing 49.56 pounds per foot. The quoted mill price of this pipe is $1.7745 per foot to which, applying the discounts of 10 percent and 2 percent reduces the price to $1.5651 per foot.

Freight at 22½ cents per cwt. is 0.1115 per foot, making a total delivered cost of $1.6766 per foot. Miscellaneous material cost of 2 percent is added, which brings the total material
740 cost of the pipe in the ground to $1.7101 per foot, which was rounded out to $1.710 per foot.

* * *

Q. Mr. Rhodes, is that the pipe which was used in the pipe line from the Cornwell Station to Hastings?

A. I believe so; yes.

Q. Will you please refer to page 67 of Exhibit 16, Part E, under Compressor Station Equipment, Cabot Compressor Station, main Units.

Will you explain the development of the unit costs for 470 horsepower gas engine compressor units?

A. This 470 horsepower engine, which is typical of a considerable number owned by the Company was built by the National Transit Pump & Machine Company. It is a four-cycle type of engine, horizontal single tandem, double cylinders, twenty inches in diameter by thirty-six inch stroke.

The National Transit Company quoted us a price for this engine which we rejected as not being typical of the prices at which we could buy the equivalent engines from other manufacturers. The lowest price we were able to get for such
741 engines quite in accord with our own experience was obtained from the Cooper Bassemer Manufacturing Com-

pany at $23,000, net, f. o. b. shipping point. This engine weighs approximately 153,000 pounds.

We added to this price the average freight to destination which was determined by applying to this weight of each of the engines, the freight to the respective destinations, there being almost forty such units. This freight averaged $530.91 per engine. We then added miscellaneous construction costs for purchasing, checking, receipt of engine, and so forth of $235.31, which is 1 per cent, bringing the total cost f. o. b. average, railroad siding, $23,766.22. The three engines at the unit price would cost $71,299.

Mr. MILDE. You said miscellaneous construction cost?

The WITNESS. I should have said miscellaneous material cost.

By Mr. SPRINGER:

Q. Will you describe the method by which you determined the installation cost?

A. The estimates of the cost of erecting equipment in compressor stations was based on detailed estimates of typical units of such equipment, the estimates themselves being based on experience in erecting such equipment.

For instance, engines of this general description are shipped knocked-down. They are so big and so heavy that
742 they would occupy some three or four freight cars, and they are knocked down into many pieces that have to be handled separately and then assembled when they are being erected on foundations.

That class of engines we call Class 1. We have had considerable experience and the Company has had considerable experience which we drew on by consultation, in the erection on the one hand of the twin tandem engines of such type, of which the Company has a few, and the single tandem engines, the twin tandem engines of which we have detailed costs and weigh 192 tons, and the single tandem engines of which we had erection costs weigh 85 tons.

This detailed unit cost development shows that in unloading these engines from the railroad cars, 583 man-hours would be required in riggers, riggers' helpers and common labor.

There is about half common labor at 45 cents an hour and about half of riggers and riggers' helpers at 85 cents and 55 cents an hour respectively. This cost is $324.55 bare labor costs for the 192 ton double unit and $161.50 for the 290 hours of labor of the 85 ton single tandem unit.

After unloading these engines from the cars, they have to be skidded on blocks by the use of jacks and chain and
743 falls and block and tackle, and tractors, and by a great deal of brute strength and awkwardness, because some of the parts weigh 25 to 30 tons apiece, they are erected and assembled on the foundations.

There are included in this assembly on the foundations the cost of setting the foundation bolts which have to be set in advance, of the erection, paying the cost of handling and assembling and erecting these engines, which requires 3,378 man-hours of labor for the large engine at a cost of $2,233.33, and 1,715 man-hours at a cost of $1,129.25 for the single engine?

This labor is predominently in man-hours, mechanics and mechanics' helpers, which accounts for 1,418 man-hours for the large engine and 710 man-hours for the small engine.

The mechanics are rated at 85 cents an hour and the mechanics' helpers at 55, the same as the riggers and riggers' helpers.

The next most important element in the labor is 951 man hours common labor in the big engine and 500 in the small engine which, on account of the fact that so many men are required, a certain amount of what we call first class common labor is used, which brings up the average rate per hour to 47½ cents.

There is an electrician involved for 56 hours with his
744 labor for connecting up the ignition, the pipe fitters for connecting up the oil pipe, and so forth. All of these are shown item by item and aggregating the number of dollars shown.

This total unloading and erecting cost then amounts to $2,557.88 for the large engine and $1,290.75 for the smaller engine, these being the amounts of money that would be paid to labor.

The insurance on labor in this class of work was quoted to us by the insurance agencies at 7.274 per cent of the payroll, which brought the total cost of labor plus insurance to $2,743.94 for the large engine and $1,384.64 for the smaller engine.

These are the direct labor costs. We have found from experience that a great deal of money is spent in connection with handling this kind of equipment in skids and blockings and special equipment, so that it is necessary to add to the direct labor cost, 80 per cent to cover these miscellaneous costs and the contractors' allowance.

That brings the total costs of erecting the engine to $4,939.09 for the 192 ton unit and $2,492.35 for the 85 ton unit.

In the erection of all such equipment, it is necessary to have in charge in each station a manufacturer's erection
745 engineer, the current charges for which, including expenses, are $25 a day. On the average, such a man spends 30 days per unit on the 192 ton units and 18 days on the 85 ton units. This charge we have taken as being paid directly by the company and not by the contractor, so that the total cost to the company of installing these 192 ton units was $5,689.09 and for the 85 ton units $2,942.35.

That was the first step.

None of these engines was exactly the way that the engines in which we had experience and were able to estimate definitely the cost so we interpolated between these costs for intermediate weight engines.

For instance, the particular engine that we had reference to weighed, with its compressor excluded, 88.85 tons. In interpolating between these costs for the equipment of 85 tons or 170,000 pounds for the small one, and 192 tons or 384,000 pounds, we proportionately interpreted those figures and found that the engines weighing from 176,000 to 180,000 pounds, within which range weight the 88.58 tons comes, we found a cost of $3,050 as the total cost of erecting such equipment.

This applied to three units, gives the $9,150.

Q. You spoke of a contractor's allowance. Will you give us the percentage?

746 A. The contractor's allowance is included in the 80 percent out of the total of 180 percent of labor as the price. 165 percent of the 180 percent is miscellaneous construction cost and 15 percent out of the 180 is the contractor's allowance. That 15 percent is measured in terms of 100 percent labor cost, rather than the 165 percent cost to the contractor, so that it represents about 8 percent of the contractor's own costs in the allowance for his profits, overhead, and so forth.

Q. On page 67 of Exhibit 16 Part E, will you continue your description of unit costs for compressor station units, by explaining the development of unit costs for compressor cylinders, Ingersoll-Rand?

A. Again, we found that the quotations by Ingersoll-Rand for these large compressor cylinders, were not reliable, they're not making very many such cylinders in the market today, so in pricing the Ingersoll-Rand compressor cylinders, we used the prices per cylinder of the whole range of cylinders quoted by Cooper-

Bessemer and by Worthington, which were consistent one with the other, in some particular sizes Worthington being lower, and the other sizes Cooper-Bessemer was the lower.

In each case we took Cooper-Bessemer or Worthington, whichever was the lower, and in this case the price per cylinder
747 of 34 inch diameter by 36 inch stroke, the first of the two descriptions on page 67 was $5,500 f. o. b. factory. We took the Worthington price. The Cooper-Bessemer price, for instance, was $6,042 for the same size of cylinder, the difference in the prices generally coming from the different point where they changed the frame or casting to accommodate the bore.

Starting with the $5,500 we added the average freight, $108.68, bringing the total price per cylinder delivered to the nearest railroad station $5,608.68. To this was added the miscellaneous material cost of 1 percent of $56.09, making a total cost per cylinder of $5,664.77, which applied to the three cylinders gives $16,994 shown on page 67.

Q. Will you please turn to page 90 of Exhibit 16, Part E, captioned Compressor Station Foundations, and explain the development of the unit cost per cubic yard of $18 for the 8 main units at the Cabot Compressor Station?

A. In determining the cost of foundations, for the main units, which are generally fairly large and fairly simple foundations, we determined the total cost per yard for a number of foundations aggregating over 5,000 cubic yards of concrete. We found that there was 9,071 cubic yards of excavation required, which was priced at $1.10 per cubic yard of excavation.

748 3,697 of those cubic yards of this excavation was required to be back-filled around the excavation at a cost of 84 cents per yard.

There was 5,329 yards of concrete at a cost of $10.21 per yard, and there was 56,000 square feet of rather complicated forms at 45 cents per square foot. There was 28,238 pounds of reinforced steel at 4.8 cents per pound.

Aggregating the dollar cost of all of these foundations was $94,055, which divided by the 5,329 cubic yards of concrete, gave an average cost of $17.65.

We used $18.00.

Q. Do you know what the cost of the aggregate is which is included in the $18?

A. The aggregate in this concrete, comprising sand and gravel, totalled $3.38 per cubic yard as bare cost. In other words, what the contractor would pay the vendor of that sand and gravel.

Q. Do you know what price per sack the cement was?

A. The cement was $2.41 per barrel.

Q. And the price per ton of sand?

A. We have it here as the price per yard.

Q. All right.

A. $2.60. And the gravel, $2.55.

Q. Now, Mr. Rhodes, will you please refer to page 137 of
749 Exhibit 16, Part E.

The TRIAL EXAMINER. Is there any contractor's allowance in that?

The WITNESS. Yes. After the labor is added, there is a 22 percent to cover the contractor's miscellaneous costs.

The TRIAL EXAMINER. That is included in the $17.65?

The WITNESS. That is correct.

By Mr. SPRINGER:

Q. Referring to page 137 of Exhibit 16, Part E, boiler plant, Cornwell Compressor Station, will you describe the development of the unit cost for boilers, Babcock & Willcox 500 horsepower sterling boilers.

A. These boiler units in the Cornwell compressor station comprise five five-hundred horsepower Sterling boilers, which the Babcock & Willcox Company quoted to us erected for $61,300 to which there are added 2 percent miscellaneous costs, making the total for the boilers themselves $62,526. These boilers all contained Diamond soot-blowers at a quoted cost of $5,800 erected, to which was added the 2 percent miscellaneous material cost, bringing the total for the soot-blowers to $5,916.

The superheaters were also quoted erected by the Babcock & Willcox Company at $13,445, which after adding the 2 percent miscellaneous costs, brings the total to $13,714.

750 There are stacks and bridgings at a quoted price of $17,430 which, after adding the 2 per cent miscellaneous costs became $17,778.60.

The brickwork for the boiler setting was quoted at $33,500 to which $670 was added for miscellaneous material costs, bringing the total to $34,170.

These five items add up to $34,170.

Q. Just what would those miscellaneous costs cover that you repeat very frequently in unit cost development?

A. They cover the costs involved in the purchase of the equipment and in the checking of its receipt, the payment of invoices,

the miscellaneous odds and ends of equipment which have been installed by the company since the original installation by Babcock & Willcox, who had only the bill of materials as originally sold. That generally describes the miscellaneous costs as applied to the boilers.

Q. Don't you include that same type of costs in your general administrative overheads?

A. No; those general administrative overheads are all in addition to the costs involved in the purchase and checking the receipt of materials. All the general administrative forces have to do with that are to pay the bill when it is approve if and when sent to them.

Q. Is it not general practice to put the purchase cost
751 into the general administrative overhead?

A. They can be so placed but I have not done it in this set-up, because I wanted all of the costs of construction to include the same thing, whether it is by contractor or by the Company.

Q. Do you know what the treatment was in the Cleveland rate case for this same item?

A. I don't recall.

Q. Will you please turn to page 139 of Exhibit 16, Part E. Cornwell Compressor Station Boiler Plant and Coal and Ash Handling Equipment and describe the development of the unit cost totalling $20,258?.

A. This equipment described here was furnished by the Link Belt Company, and they quoted us for this equipment $19,286 f. o. b. Philadelphia, giving us a weight of 115,000 pounds.

The freight rate on this class of equipment was 50 cents per 100 pounds, which added to the factory cost gave $19,861.

Again the 2 per cent miscellaneous material cost was added in the amount of $397, bringing the total cost up to $20,258.

Q. Do you know that the Hope Natural Gas Company no longer burns coal?

A. That is a temporary situation. They must necessarily be equipped to burn coal in their stations, as the natural
752 gas supply may become short during the winter periods, or conditions may gradually change in the availability of gas.

Q. Do you know the last time that this coal and ash handling equipment at the Cornwell Compressor Station was used?

A. No, I do not.

Q. Will you please refer to page 156 of Exhibit 16, Part F, Compressor Plant, Hastings, No. 1 Compressor Station, and de-

scribe the development of the unit cost for yard-lines, 3,043 feet of 16-inch pipe at $4.24 per foot?

A. This cost of $4.24 per foot of 16-inch pipe in the yard lines, is based on pipe at a unit cost per foot that has been used in pricing pipe lines for this same 16-inch pipe, namely $2.153 per foot. That was before the allowance for the miscellaneous costs, and we found on analyzing those lines in the yard lines in a number of stations, taking into account the different sizes of lines that in the case of the 16-inch yard line, there were fittings in the run of the line which brought the total cost f. o. b. railroad to $2.799 per foot, on the average for 16-inch lines. This material being in miscellaneous lots, by that I mean that not very much of it is in existence in any one station, and consisting of a number of parts of various lengths, we treated it as small line pipe and added the 3½ per cent miscellaneous material costs instead
753 of the 2 per cent which would be done if it were laid in a main line.

The cost of installing this 16-inch pipe was based on the cost of installing such size under the conditions in West Virginia, determined by the method which is explained in the document which is Exhibit 17, with allowance for the fact that a considerable additional work is involved in the installing of fittings, as compared with pipe. This installation cost was $1.34 per foot, bringing the total cost including installation to $4.2377 per foot, which was rounded out to $4.24 per foot.

Q. Is that unit cost development which you have described typical of the prices applied to all lines?

A. That is correct, except that we find for the smaller sizes a greater additional cost because of fittings, there being a greater proportionate amount of fittings in the small lines than in the big ones, otherwise the method of determining the unit costs was the same for all sizes of line from the smallest to the largest.

Q. What was the additional amount for the two-inch pipe?

A. Proportionately we found by analyzing a considerable footage of the two inch pipe that the fittings in the two-inch lines cost almost as much as the pipe itself did. These
754 prices from the smallest up to five inches in diameter include in a general way considerable footage in the various stations, and we found on the average that the fittings cost 98 per cent of the price of the pipe, whereas from the six to fourteen inch, inclusive, the fittings only cost 34 per cent of the cost of the pipe, and the sixteen and eighteen, 30 per cent, and the 20

and 24 inch 20 per cent. Those figures are arrived at, as I say, by pricing a considerable footage of lines to avoid having to type in a complete unit cost development for a long list of bills of materials which would add nothing to the accuracy of the whole result.

Q. Will you now refer again to page 18 of Exhibit 16, Part E. For the Bee Compressor Station, you priced four main units of foundations, is that correct?

A. That is correct.

Q. On page 7 of the same volume, there appears to be only two main units in the Bee Compressor Station.

A. That is correct.

Q. What use is being made of the two idle foundations?

A. No use is being made of them, and that fact is reflected in the reproduction cost new less depreciation of that station.

Q. You priced everything not used or useful and then depreciated it?

755 A. If it was still carried in the original cost determination, it was included in the reproduction cost new, so that they could be properly accounted for, but in determining the reproduction cost new less depreciation, the cost of those foundations is wiped out.

Q. If the structure housing this compressor station and only two units being used was twice as large as required for those two units, did you also consider that in your reproduction cost new less depreciation?

A. I reflected the partial use of that structure by eliminating the cost of that which could be dispensed with and still allow sufficient operating space for the two remaining units.

Q. That situation is true in many places throughout the Hope system. Have you been consistent in your treatment of them?

A. I have tried to be, and so far as I know I have been completely consistent.

Q. Did you explain Mr. Rhodes, why the foundations which do not have units upon them in the Bee Compressor station were included in your reproduction cost new estimates, and why you treated them as a part of the depreciation relating to the station in your reproduction cost new, in your depreciation estimates?

756 A. We tried by every possible means to make the inventory of reproduction cost new correspond with the inventory of original cost, so that the two would be properly compar-

able, and for that reason we left in the reproduction cost new certain buildings, certain foundations and certain equipment which we treated specially under depreciation to reflect the fact that the building was no longer useful or the foundation was no longer useful or the equipment was merely being held there as though in a warehouse.

Q. Then your original cost and your reproduction cost really are not comparable, are they?

A. Oh yes; because in the original cost, the entire building and all of the foundations and all of the equipment were included.

Q. The original cost does not reflect the retirement of the two foundations that are not being used?

A. No, it does not.

Q. But you do reflect that in you reproduction cost new less depreciation?

A. I take out the nonuseful features.

Q. I was just wondering why you did not eliminate it from the inventory in the first place.

A. It was desired by the management to continue these items in the original cost and to have the reproduc-
757 tion cost new correspond to the inventory and with original cost.

Q. Did you personally make an inspection of the property of your reproduction cost new less depreciation estimate to determine what was not used or useful?

A. I did not personally inspect the property for that purpose, but an inspection of the property was made by my staff to determine to what extent that was so.

Q. Will you please refer to page 25 of Exhibit 16, Part G, Indian Creek Compressor Station equipment, and explain the development of the unit cost for the generator five kilowatt DC, 125 volts at $275?

A. This motor was a motor that the Triumph Electric Company stated they were not now making and suggested that we use the General Electric Company's price for a motor of like description, which was $300 from which we took a quoted discount of 14 per cent, getting a net price of $258 f. o. b. factory. The pulley and base were added, bringing the total cost up to $270 to which, adding a 2 per cent miscellaneous material cost brought the total up to $275.44 or $275 as we used it.

Q. Now, Mr. Rhodes, will you please refer to page 95 of Exhibit 16, Part B, producing gas wells and well construction, and describe the development of the average unit cost per foot of $2.43.

758 A. I have already described the method generally, but there exists in the working papers a memorandum of the procedure followed, which corresponds to that in the determination of the cost of laying pipe. This goes into full detail, and there are fifteen or twenty pages. This is available to you for such use as you may desire.

* * *

759 Q. Now, Mr. Rhodes, will you please refer to page 7 of Exhibit 16, Part I, and describe the development of the unit costs of the general office buildings in Clarksburg, West Virginia at $0.457 per cubic foot.

A. This office building as it existed at December 31, 1938, was measured up in detail, and quantities of all kinds of work entering into the construction of the building were determined, starting with excavation and going to the buzzer system.

There are two whole pages of items and another half a page making approximately 100 items, but in pricing these items in detail, it was found that the total cost of constructing that

760 building as of the period of 1938 and 1939 was $115,762.29.

The volume of the building was 253,368 cubic feet, which gave the cost per cubic foot of 0.457 per cubic foot.

That method of pricing in an inventory was used to avoid the extreme detail of the large number of items entering into its construction.

Q. Is there a contractor's allowance in that estimate?

A. The same as in all building construction. For the contractors' miscellaneous material and labor costs and the contractors' allowance there is a total of 22 percent of which approximately 10 percent may be considered as a contractors' allowance, of which, however, he receives only about 8 percent or 9 percent on his costs.

Q. Will you compare that cost per cubic foot of $0.457 with the cost per cubic foot of the one-story wood frame building on page 10 at $0.909?

A. One is a building of 253,000 cubic feet and the other is a very small building, equipped with toilet facilities.

Q. The fireproof building is priced at a smaller cost per cubic foot on page 7 than the wood frame sheet metal building with a

corrugated roof and concrete floor on page 10. Almost twice a
much per cubic foot.

A. That is due to its extremely small size. A building five
foot six by thirteen feet and an average height of eight
761 feet, a little building of 587 cubic feeet, there is no possible
comparison of cost in a building of that size directly with
a building of 253,368 cubic feet. It is about the size of the
smallest room in the big building.

The TRIAL EXAMINER. Does that include the cost of the toilet
facilities too?

The WITNESS. Yes, but it is a building made solely for that
purpose.

The TRIAL EXAMINER. The cost of the facilities would be worth
more than the cost of the building?

The WITNESS. It may well be, in a building of that size, yes sir.

Mr. SPRINGER. Mr. Examiner, that completes our cross examina
tion on reproduction costs.

2923 **TESTIMONY OF F. P. C. WITNESS PACE ON ACTUAL LEGITIMATE COST OF HOPE'S PLANT**

Transcript pages 2923–2925, 2961–2963

(Omitted in Pace's Testimony Printed in Supplement to Brief of Petitioner)

* * *

Cross-examination by Mr. COCKLEY:

Q. Let us take the case of the property acquired by Hope as utility property from those particular companies; tell me what use you made in your original cost study of those original records; you can start with any one of the three.

A. In connection with the Clarksburg acquisition, there is a positive statement attached to that voucher that the amounts that you recorded in the Hope books were the exact amounts as shown in plant account on the Clarksburg Light and Heat Com-
2924 pany's books and that the same amounts and reserves are reflected in the Hope Company's books in the same amounts.

Q. Is that what you meant by our estimate of original cost; is that what you meant by the Hope's estimate of original cost at the time of acquisition, that statement on that voucher?

A. No; I would not consider that an estimate; that is cost obtainable from the prior utility's books.

Q. What did you find besides that that you would consider an estimate of original cost by the Hope Company at the time it purchased that property?

A. That particular property?

Q. That is what we are talking about; you picked it.

A. I do not know they made any estimates at all in connection with the Clarksburg acquisition; I do not think they did.

Q. How did you treat that Clarksburg acquisition? The plant account was set up as $2,000,000, we will say, and the depreciation reserve at $1,000,000, and they paid $1,000,000 for it; is that right?

A. Yes.

Q. What figure do you show in your original cost exhibit for that property on that assumption; what figure would you show in your exhibit included in the $51,000,000?

2925 A. We show the amount as original cost that was shown on the Clarksburg Light & Heat books.

Q. You would set it up here as $2,000,000 on the proposal I have made?

A. Yes.

Q. And you later put in a depreciation reserve of $1,000,000 as of that date?

A. Yes, sir.

Q. And you would have $1,000,000 net?

A. That is right.

Q. And that is the price that the Hope Company paid for it when it acquired it, is it not?

A. Yes, sir.

Q. And that is what you have got in your figures?

A. That is right.

* * *

2961 Redirect examination by Mr. SPRINGER:

Q. Now in the case of Mr. Antonelli's estimates in his claimed original cost, why didn't you accept those?

Mr. COCKLEY. You mean the part of it that was estimated, are you limiting your question to that?

* * *

The WITNESS. I could see no reason why Mr. Antonelli would be in any better position to estimate those costs than the person that estimated them at the time the property was acquired. I think if it were permitted to re-estimate the same property from time to time, that probably there would be no end to what finally might get on the books.

By Mr. SPRINGER:

Q. You mentioned the possibility of an improper distribution of expenditures explaining some of the differences in the figures which Mr. Antonelli claims for various accounts, and figures which you found to be the valid original cost. Will you elucidate that?

A. Well, there was in the direct labor and material costs which were claimed by the company to have not been capitalized. I don't think they even claim it to be expense; and they also
2962 claim it not in plant accounts. Of course if it can't be identified either in expense or in plant, I wouldn't know just exactly where to look for it.

Q. You mean you doubt that such an expenditure had been made?

A. There was some of the direct labor and material cost that was supported, but an examination of those costs indicate that it was more or less of an attempt to re-account for past costs, and by that I mean go back and change maintenance costs to plant accounts; and for that reason I disallowed that.

In fact I think, with reference to a number of those items, if I had found them in plant accounts to start with I would have thrown them out; but I considered them properly maintenance charges.

Q. And you also found unrecorded retirements, didn't you?

A. Yes.

Q. Now where you found overheads charged to expense, and there was an attempt to capitalize those retroactively in Mr. Antonelli's study, you disallowed those on an accounting principle, didn't you?

A. Yes sir; it wasn't merely the method by which they were computed, it was altogether the accounting principle.

Q. Well, to sum up your ascertainment of the valid original cost as of the end of 1938, you have not disallowed any supported asset accounts in the Hope Company's original cost, 2963 have you?

Mr. COCKLEY. I object to that: there are thousands and thousands of items.

Trial EXAMINER. Well, what difference does that make if he is familiar enough with them to say whether he has or whether he has not.

Mr. COCKLEY. All right.

The WITNESS. We haven't disallowed one dollar, that I know of, from their plant accounts; in fact I think we were very liberal.

By Mr. SPRINGER:

Q. In fact you added $1,400,000 to the plant costs, did you not?

A. We added that much to what was reflected on the books.

Trial EXAMINER. You don't mean that those amounts were unsupported?

The WITNESS. No, sir; that amount was supported.

1547 **TESTIMONY OF HOPE WITNESS CHISLER ON HOPE'S ACCOUNTING PRACTICES.**

Transcript pages 1547–1560

* * *

JOSEPH C. CHISLER, previously sworn, resumed his testimony:

Examination by Mr. SPRINGER:

Q. You are the vice president and the chief accounting
1548 officer of the Hope Company, are you not?

A. Yes; sir.

Q. How long have you been the chief accounting officer of the Hope Natural Gas Company?

A. Since July 1, 1933.

Q. What was your accounting responsibility before that time?

A. I was assistant treasurer, in charge of all accounting work.

Q. Who was the chief accounting officer of the Hope Natural Gas Company before you?

A. Mr. R. D. Beardsley was the treasurer.

Q. Do you adopt the accounting methods employed in Exhibit 20 by Mr. Antonelli?

Mr. COCKLEY: I do not think that is a proper question to put to this witness—whether he adopts all of the accounting methods. If he wants to ask him about some particular one, why not do that?

By Mr. SPRINGER:

Q. Did you not advise Mr. Antonelli on various accounting phases of his exhibit, and do you disagree with any of the accounting principles that he said he used?

Mr. MILDE. There are two questions there. May we have one at a time?

1549 The WITNESS. I advised Mr. Antonelli on the determination, or assisted in the determination of actual original cost. We determined the interpretation of original cost as defined in the West Virginia Classification of Accounts of 1913—our interpretation.

By Mr. SPRINGER:

Q. And he followed your advice, did he not?

A. Ove a period of two years, of course, we had numerous conferences, and we consulted with our attorneys and my assistants, and Mr. Antonelli also had recommendations, but the

whole plan and procedure was worked out together and the decisions made.

Q. Then you are in agreement with the accounting methods employed by Mr. Antonelli in Exhibit 20, are you not?

A. I am in agreement with the original cost that has been determined and shown in Exhibit 20, that that is the true original cost, according to our interpretation.

Q. Do you disagree with the accounting methods employed in Exhibit 20?

A. I think, Mr. Springer, what is presented in Exhibit 20—what Mr. Antonelli has presented—is the original cost as defined in this Classification of Accounts prepared in accordance with our interpretation, and that is what he has presented here.

1550 Q. Well, then you agree with the method employed by Mr. Antonelli?

A. I agree with the method.

Q. Now, with respect to all the labor costs other than well construction, they were capitalized up to 1918 by the Hope Company, and then expensed to 1923, and then capitalized after that, is that so?

A. There was a portion that has been expensed, from 1918 to 1923—certain portions of the construction.

Q. I asked you for the labor costs other than well construction?

A. That is true, but I stated that all labor costs other than construction were not expensed. That is what I wanted to imply.

Q. For what period?

A. From 1918 to 1923. In other words, there was certain construction work on lines and compressing stations where the labor cost was charged to expense, but not on all construction.

Mr. COCKLEY. That is in the period from 1918 to 1923?

The WITNESS. 1918 to 1923.

By Mr. SPRINGER:

Q. Then from 1918 to 1923, construction labor other than well construction, was expensed, and after that time

1551 capitalized, is that right?

A. If I can make myself clear—our construction work for the period 1918 to 1923, a portion of it, the labor costs—this is other than wells—was expensed. A portion of it was capitalized.

Q. You are familiar with the rate case involving the Hope Company before the West Virginia Public Service Commission in 1921, are you not?

A. I might have been at that time; I have not looked at it for years.

Q. Do you know what the Hope Company contended for the treatment of well construction costs in the 1921 rate case?

Mr. Cockley. I object to that. What conceivable difference does it make what in a local rate case, down here, they contended for in 1921?

Mr. Springer. I think it is highly important, Mr. Examiner, that we determine what claims were made covering the same items, now that they are attempted to be capitalized in this case.

Mr. Cockley. Well, we submit that here is a rate case down here which was obviously a local rate case in West Virginia, and involved distribution rates in West Virginia. The export rate, the wholesale rate, has never been under determina-
1552 tion. Are you going into that rate case in 1921, and then if the Hope Company had another one in 1927, are you going to go into what they claimed then, and then if we go ahead up to the rate case that we had in Ohio, see what they claimed in 1931, and 1932, and in the 1937 case, and I forgot one in Ohio in 1921, and see what was claimed then? Where does it all get us? Either we are entitled to include these things in the original cost or we are not; and what was claimed at one time or another is not going to make a particle of difference, and it is a perfect waste of time.

Mr. Springer. Mr. Examiner, I think this will show the Company's stand and past accounting practices, where it is claimed as operating expense items which now are attempted to be capitalized, and I think that you and the Commission are entitled to know the past accounting practices and the exercise of managerial discretion in accounting for these things. All I am asking the chief accounting officer of the Hope Company is whether or not he knows the past claims of the Hope Company in a rate case.

The Trial Examiner. After all of this discussion, he may know what you mean. The objection is overruled.

Mr. Cockley. Exception.

The Witness. I know what he means, but I don't recall what treatment we gave on the construction costs in that rate case.

By Mr. Springer:

1553 Q. Well, Mr. Chisler, are you aware that the West Virginia Public Service Commission stated in that 1921 rate case that well construction costs was a proper operating expense

for the purposes of that case, and that is reported in P. U. R. 1921 E., page 418?

A. I have not reviewed that and I am not just familiar with what treatment might have been given to well construction costs in 1921.

Q. The financial statements that your company has made in the past have been issued in the expectation that they would be relied upon as being an accurate statement of your accounting policies, isn't that so?

A. They have reflected our accounting, yes. They are prepared monthly, and reflect the conditions and the principles that are followed.

Q. And you consider your books of account to be important sources for the basis of your financial statements, don't you?

A. I do.

Q. Taking the $17,000,000 that, but for a small percentage, has been charged to operating expenses now capitalized in Mr. Antonelli's exhibit, when your company decided to expense those amounts, it did so in the exercise of managerial discretion, did it not?

A. Well, we followed the Code of Accounts, or we exer-
1554 cised that discretion.

Q. Sometimes you had an option to expense or capitalize well construction costs, for instances, didn't you?

A. That is true.

Q. And you made an election and expensed those costs?

A. That is true.

Q. Has the Hope Company always had a competent accounting officer?

A. Well, they have had several of them, and in my opinion, they have been competent; otherwise I do not think they would last very long.

Q. Then the Hope Company's past accounting policies have been the result of competent and well informed deliberate accounting advice, isn't that so?

Mr. COCKLEY. I object to that as calling for a half a dozen conclusions. The facts have been developed and they are perfectly obvious as to how these things were charged, and that is all that is important in this record. I object to it as wholly incompetent, immaterial and irrelevant.

Mr. SPRINGER. I think it is important, Mr. Examiner, that we determine whether or not these representations made through

their financial statements, were well advised, well informed and deliberate.

Mr. COCKLEY. Of course there were not any representa-
1555 tions made through financial statements, to anybody.

Wholly aside from that, this question calls for about three or four different conclusions and is wholly immaterial.

The TRIAL EXAMINER. I think the witness is able to take care of himself and answer the question.

* * *

The WITNESS. I would say that is true.

By Mr. SPRINGER:

Q. Was not the expensing of well construction costs the accounting practice at the time it was employed by the Hope Company in its accounting?

A. The well construction costs, from the beginning of business up to December 31, 1922, was charged to operating expense.

Q. And that was an accepted practice at that time, was it not?

A. That is the acco[illegible]ing principles that we followed, and I think generally in the oil business, and so on, that those construction costs were charged to expense.

Q. As even today some oil companies charge well construction to expense?

A. That may be so, but I don't know. January 1st, 1923, when the new Code of Accounts came in, we started to capitalize
1556 it.

Q. Were the Hope Company's books periodically audited by a certified public accountant?

A. We had our own internal auditing department for quite a number of years. It is only since recently that we have had outside Certified Public Accountants, Price, Waterhouse, I think since the Social Security came in, which made it mandatory at that time.

Q. Was there not a periodic audit by Certified Public Accountants before that time?

A. No, not to my recollection.

Q. Has your company in the past made under oath financial statements based upon your policy of accounting, to regulatory States and Federal taxing bodies?

A. We did.

Q. What effect did the noncapitalization of well construction costs have upon the Hope Company's financial statements to

stockholders, regulatory bodies, Federal and State taxing authorities, and institutions issuing financial publications?

A. Well, of course, the stockholder is the Standard Oil of New Jersey; that is the one stockholder. I don't know that had this $11,000,000 of well construction costs been capitalized,
1557 how large a depreciation allowance there would have been. I don't know what the net effect would have been.

Q. Was not the effect of noncapitalization of well construction costs to reflect less profit because that was charged to operating expense?

A. Well, the difference between the depreciation and the full amount of the well construction costs would probably reflect some change in the net income.

Q. What was that?

A. I say, the difference between the amount capitalized and the full 100 per cent of the well construction costs would have some effect on the results.

Q. I believe you stated that the Hope Company practice of noncapitalization of well construction costs would likewise affect the stockholding company, the Standard Oil Company of New Jersey?

Mr. MILDE. We object to that. That is not a fair statement of anything the witness said.

* * *

The WITNESS. Would affect them in what way?

By Mr. SPRINGER:

Q. Just as you have said. It would be a statement showing less profit if the well construction were expensed.

1558 A. It might be less loss or increased loss.

Q. Doesn't that make some difference in the Standard Oil Company of New Jersey's consolidated financial statement? It is a chain without a broken link, isn't it?

* * *

The WITNESS. Well, of course, the Hope Company happens to be one small company out of a large number in the Standard Oil of New Jersey. I don't know that it would greatly distort their picture.

By Mr. SPRINGER:

Q. You mean that $11,000,000 would not distort the financial statement? That is a sizeable sum, isn't it, Mr. Chisler?

A. Over a period from 1898 down to 1922, it is an accumulated sum.

Q. Are you aware of the Federal Income Tax regulations, which require the Hope Company to elect to treat well construction costs either as operating expenses or as a capital item?

A. Yes; I am familiar with that.

Q. That is Article 223 of Regulation 69, Income Tax Act of 1926, United States Internal Revenue. What election did the Hope Company make in connection with well construction costs for income tax determination?

1559 A. I would not be positive, but I think it treated that as an expense item.

Q. You made a consistent practice of doing that?

A. That is my recollection.

Q. During the period when the Hope Company began capitalizing well construction costs, did the Company's financial statements show the full effect of a change in accounting policy?

A. In effect, we continued to charge that to expense—the well construction costs. There was a reserve set up of the full 100 percent which was charged to depreciation expense or amortization expense, so in effect, as far as the net income is concerned, there would be no change.

Q. In effect, the capitalization of well construction costs was nullified by concurrent additional accounting?

A. That was the effect. I mean we amortized it fully 100 percent each year.

Q. How long did that practice continue?

A. That continued after 1923, to the time when we had this depreciation adjustment which was January 1st, 1927.

Q. Do you mean that after 1923 your company practiced the capitalization of well construction costs, with concurrent additional accounting entries, which nullified that change

1560 in accounting, and that continued from 1923 to 1927?

A. I would not say it nullified it. We capitalized it and amortized it fully down through 1933.

Q. How long did the policy continue after 1923 of capitalizing well construction costs where the net effect was not to change the net income of the company?

A. Beginning with 1934, January 1st, the well constructing costs were placed on a depletion basis, and on the amount of gas withdrawn, rather than on this amortization basis, and as far as the financial statements are concerned, that change-over would

be reflected, as I recall, as of January 1st, 1934. This adjustment was made, of course, and would appear in your surplus adjustment which was referred to before. That would not affect any of the current year's financial statements down through.

Q. Did the Hope Company in its history make any other substantial changes in its accounting principles and methods?

A. I don't recall of any offhand.

* * *

## 1171 TESTIMONY OF HOPE WITNESS ANTONELLI ON ESTIMATED "ORIGINAL COST" OF HOPE'S PLANT

Transcript pages 1171–1271, 1325–1353, 5068–5104, 5107–5196, 5572–5658, 6250–6345

* * *

Cross-examination by Mr. SPRINGER:

Q. Will you please turn to page 5 of Exhibit 20. How did you determine what property to exclude, which you term "distribution and General, used solely for the distribution of gas in West Virginia?"

A. The properties to exclude for distribution, used solely for distributing gas in West Virginia were indicated to me by the company as such properties, and they were not included in this particular report.

* * *

1172 Q. And that was consistent with the property listed by Mr. Rhodes in his reproduction cost new estimate?

A. Yes, sir.

Q. Do you know what features of general property your did exclude as being used solely for the distribution of gas in West Virginia?

A. I believe some of the transportation and equipment was excluded, and there might be some others, that I could not tell you offhand.

Q. Were there any buildings?

A. Of course, the buildings in the various city plants were not included in our original cost estimates.

Q. What is the basis for your determination of items formerly charged to operating expenses and which should be re-stated as capital items, in your Exhibit 20?

A. Because, in order to determine the complete original cost, it is necessary to include all costs, regardless of how they were shown on the company's books.

Q. And what authority have you for that statement?

A. I was engaged to determine the complete original cost of Hope properties, and in order to determine the complete
1173 original cost it was necessary to include all elements of cost irrespective of how they were shown on the books of the Company.

Q. Are you familiar with the instructions in the Uniform System of Accounts for Gas Utilities, prescribed by West Virginia in 1939, Exhibit 13 in this case?

A. Yes, I am.

Q. Will you please turn to page 20, Account No. 100–1, "Utility Plant in Service" which reads:

"This account shall include the original cost of utility plant, included in accounts 301 to 390, together with the amounts recorded in accounts 391 and 392, owned and used by the Utility in its utility operations, including such property owned by the Utility but held by nominees."

Then will you please refer to page 48 under "Instructions—Utility Plant Accounts," and paragraph B reads:

"The cost to the Utility of its utility plant shall be ascertained by analysis of the Utility's records. In ascertaining the cost, it is not intended that any correction need be made for depreciation, depletion or amortization, applicable to operating units or systems previously acquired, whether or not such depreciation, depletion or amortization was recorded in the books of the accounting utility." It is likewise not intended that adjust-
1174 ments shall be made to record in utility plant accounts amounts previously charged to operating expenses in accordance with the uniform system of accounts in effect at the time or in accordance with the discretion of management as exercised under such uniform system of accounts."

Does not that instruction forbid you to re-state as you have in exhibit 20, items which were formerly charged to operating expenses, that you have now capitalized?

A. We determined the original cost based on the accounting principle of the uniform accounts prescribed by the West Virginia Commission. And according to the definition given on page 5 for original cost, original cost as it applies to gas utilities, it means the cost of such properties to the person first devoting it to public service. Also on page 48, it states in paragraph C that if the original cost is not obtainable, it could be estimated.

It seems to me that paragraph B on page 48 is inconsistent with what the definition of original cost is stated to be and what is said in the paragraph C and we determined the original cost, the complete original cost, as I said, irrespective of the charge in the Company's books.

Q. Then your determination renders meaningless the specific part of Instruction B for Utility Plant Accounts, does it not?

A. Well, I think these instructions are inconsistent.
1175 I think there must be some mistake in stating that here. In one place they tell us to determine the original cost,

and if you don't know the original cost, it can be estimated. In another place you are told to record the cost as determined from the Company's books. It could not be original cost because, for instance, if we take the account of equipment or take the account of wells, the original cost of a well will be the cost of the equipment, plus the construction cost for sinking it. If we follow these instructions here, we go to the books and obtain only the cost of the equipment, because the cost of the construction has been expensed. I do not see how the cost of the equipment is the complete original cost of the well.

Q. You did not choose to follow the specific instruction for utility plant accounts, then?

A. No, sir; we followed the accounting principles.

Q. Are accounting principles supposed to be consistent? Is not one of the virtues of accounting claimed to be consistency?

A. I don't understand your question; I don't know what you mean.

Q. Is it consistent to charge to operating expenses and make financial reports based upon that discretion of the management——

1176 A. (Interrupting.) No, but ——

Q. (Continuing.) And then later restate those same amounts as capital items?

A. I was not doing an accounting job. I was determining the original cost of the property existing on December 31, 1938. I was not interested in bookkeeping or accounting practices of the companies at all. My job was to determine the original cost of the Hope properties.

Q. But you said you did it in compliance with the Uniform System of Accounts for Gas Utilities, prescribed by West Virginia.

A. I followed the accounting principles, yes.

Q. You followed accounting principles, but you did not do an accounting job?

A. No, sir. My job was to determine the correct original cost of these properties.

Q. Now, on page 6, you say that there was no system of accounts prescribed for the Hope Company prior to 1922. Does that mean that the Hope Company was not subject to regulation prior to 1922?

A. The Public Service Commission of West Virginia was organized in 1913 or 1914, and I believe that all of the companies

were required to furnish annual reports, because I have seen such reports. That is prior to 1922, so judging from that, I
1177 assume that they have been under regulation, but I am not not quite sure.

Q. On page 6 you state that the Hope Company did not capitalize well construction costs. How much have you restated in Exhibit 20 for that item?

A. The amount?

Q. Yes.

A. $11,279,554.08.

Q. And that amount was formerly charged to operating expenses, was it not, by Hope?

A. Yes, sir.

Q. Was the Hope Company involved in a rate case before 1922, do you know?

A. No, I don't know.

Q. And you don't know what the Hope Company contended for the treatment of well construction costs in its 1921 rate case then?

A. No, sir.

Q. And you are not aware of the fact that the West Virginia Public Service Commission stated in the 1921 Hope Rate Case that well construction costs was a proper operating expense for the purposes of that case?

A. No, sir.

Q. You stated that the Hope Company did not capitalize well construction costs. Was that an accounting discretion
1178 exercised by the management?

A. It must have been an accounting practice. In those days, I suppose that was the proper way to do it.

Q. Do you know who made the decision?

A. No, sir; I do not.

Q. Do you know that there are periods when non-capitalization of well-construction costs was practiced by Hope and when it was discontinued?

A. It was discontinued in 1923.

Q. And practiced from 1891 up to that time?

A. Yes, sir.

Q. And was the non-capitalization of well-construction costs the accepted accounting practice at the time it was employed by the Hope Company?

A. I believe that generally is correct.

Q. Some oil companies practice non-capitalization of well construction costs today, do they not?

A. That is my understanding, yes, sir.

Q. The Hope Company's decision not to capitalize well construction costs would affect its financial statements, would it not?

A. Yes.

Q. In effect, it would reflect less profit because the well construction was charged to operating expense?

1179 A. I would not know that.

Q. Doesn't it follow?

A. I don't know.

* * *

Q. Do you know what effect non-capitalization of well-construction costs would have upon the Hope Company's financial statements to the stockholders, regulatory bodies, and Federal and State taxing authorities and financial publications?

A. No, sir.

Q. The Hope Company's practice of non-capitalization of well-construction costs, you say, would affect its financial statements. It would likewise affect the consolidated statement of the Standard Oil Company of New Jersey, would it not?

A. I don't know. I have not given any thought to that.

Q. Are you familiar with the Federal Income Tax regulations, which require the Hope Company's officers to elect to

1180 treat well-construction costs either as operating expenses or as capital items?

A. No, sir; I am not.

Q. Do you know what election the Hope Company did make in connection with Well Construction costs for income tax determination?

A. No, sir.

Q. During the period when the Hope Company began capitalizing well-construction costs, did the Company's financial statements show the full effect of the changed accounting policy?

A. I don't know.

Q. Did you analyze the Hope Company's books from 1891 to the present time?

A. I analyzed the vouchers pertaining to the existing properties at December 31, 1938. As I said before, we had an inventory of all of the units in the Hope system, and my job was to determine the original cost, and I went to the proper vouchers and the proper company's books to determine the actual original cost. I was not interested in any of the company's bookkeep-

ing practices, as far as financial statements and so on were concerned.

* * *

1181 By Mr. SPRINGER:

Q. Then you did not make a complete examination of the books throughout the history of the Company?

A. I did, as far as the existing property is concerned: yes, sir.

Q. Did you consider all of the entries that related to the property in existence?

A. I considered all the entries that related to the costs of the properties in existence.

Q. But you do not know what changes were made by the Hope Company in its accounting procedure at the time it started to capitalize well-construction costs?

A. I was not interested in the accounting procedures of the company's. I determined the original cost of existing properties from the company's records.

* * *

Q. Mr. Antonelli, who made the decision that well-construction costs which were charged to operating expenses should be restated as capital items, in your Exhibit 20?

A. Well, I was asked to determine the real original costs of the properties, and I did so by going to the company

1182 records and finding the real costs of these properties. Nobody made the decision, as far as I was concerned, or as far as that is concerned. I had the general instructions to determine the complete original costs.

Q. Can we say in summary then, Mr. Antonelli, that you restated more than $11,000,000 for well-construction costs, which were charged to operating expenses, and you have placed them in capital now, without consideration to the specific instructions in the West Virginia System of Accounts?

A. Well, the only thing I did, as I said before, was that I determined the original costs, the complete original costs.

Q. On page 48 of the System of Accounts, you have rendered meaningless the instruction B, the last sentence: "It is likewise not intended that adjustments shall be made to record in utility plant accounts, amounts previously charged to operating expenses in accordance with the Uniform System of Accounts in

effect at the time or in accordance with the discretion of management and as exercised under such uniform system of accounts."

A. Well, if I had followed these instructions, I could not determine the real original costs.

Q. Why?

A. It just could not be done. The books do not record
1183 the complete costs. I had to go to other sources to get that cost.

* * *

Q. Was the effect of the Hope Company capitalizing the well-construction costs modified or nullified by concurrent additional accounting entries?

A. I don't understand the question.

Q. Well, is it not true that when a well construction job was closed, and charged to fixed capital, an additional entry was
1184 made charging operating expenses and crediting reserve for depreciation and depletion with an amount equal to the cost of well construction capitalized?

A. I did not pay attention at all to the Company's procedure, as I said before. My job was to determine original cost.

Q. Do you know whether the Hope Company, in its history, made any substantial changes in its accounting principles and methods other than those required by the various systems of accounts prescribed by the West Virginia Public Service Commission?

A. No; I don't know offhand.

Q. Were any changes in the Hope accounting principles and methods made without competent advice and authorization from responsible officers?

A. I don't know.

Q. Did not your analysis of the books reveal who the accounting officer was each year, and whether or not there had been determinations of principle and method by the management?

A. I was determining original cost. This was a job of going to the company's records and finding out how much should be charged as original cost, and that is all.

Q. Is the determination of original cost an exact science?

A. If all of the data and information is available, it would be an exact science.

1185 Q. In this case all of the data and information were not available, is not that so?

A. They were all available to the extent of 94 per cent. We estimated about 6 per cent.

Q. How many dollars does the 6 per cent amount to?

A. $4,000,000 or $5,000,000.

Q. Four or five million dollars?

A. Yes.

Q. Do you know whether the Hope Company has ever reclassified its property accounts before?

A. Do you mean since this Commission came into existence—since the West Virginia Commission came into existence?

Q. Well, no. From the beginning of the Hope Company's history.

A. Yes. In the beginning the Company had its property classified as perhaps ten accounts. Material prices were in one account, the labor was in another account, the compressing station, structures and equipment, were in the other accounts. Then in 1923, of course—No. It was reclassified once more, I believe, in 1913. The properties were reclassified as to production, transmission and distribution properties. Then they were reclassified in 1923 in accordance with the new classification of accounts of the West Virginia Public Service Commission. Then, there
1186 were some changes made in the classification of accounts in 1932—just minor changes. I believe the drilling and cleaning account was changed from "Production" to "General."

Q. What is the difference between the former reclassifications and your present one in Exhibit 20—fundamentally?

A. There are reclassifications as to the items of property and the general accounts have been reclassified considerably. In the prior accounts, the overheads, the so-called undistributed construction items, were all grouped together under several accounts. They were not distributed. In this case here, in this new system of accounts, they are all distributed with the items of equipment.

Q. Well, Mr. Antonelli, did the reclassification by the Hope Company in 1913 result in an increase in the total book cost.

A. I don't know. I could not answer that question.

Q. Did the reclassification in 1923 increase the total book cost?

A. I would like to make a correction. They reclassified the properties in 1920 and not in 1923. It did not increase it; no, sir.

Q. In 1932, did the reclassification result in an increase of the total book cost?

A. I don't think so.

1187 Q. Did the 1920 reclassification result in a decrease in the total book cost?

A. No, sir.

Q. Are the company records available to show the basis for the determinations made in the previous classifications?

A. It might be possible to obtain the information, but it would be a tremendous job and would take several years to do it, because properties have been abandoned and changed. It would be a very difficult job.

Q. Are the working papers available, underlying the former reclassifications?

A. You would have to go to the vouchers and other records to obtain the information. It would be a very difficult job to do.

Q. Did you have access to the working papers underlying the reclassifications formerly made?

A. I used them indirectly through vouchers. For instance, the reclassification made in 1920 was done through a memorandum voucher known as M-699, and we worked through that voucher considerably, to determine our original costs.

Q. Were there working papers supporting the memorandum vouchers?

A. Yes, there were a lot of vouchers, which all go back to this M-699 voucher.

1188 Q. Did you make use of those?

A. Yes, sir.

Q. Did you have available working papers summarizing all of the supporting vouchers in the former reclassification?

A. No, sir; I went direct to the original vouchers.

Q. Were those working papers available?

A. I did not need those papers to get my original costs.

Q. Well, they are in existence then, and available to the Commission's staff, I presume?

A. I presume they are. I don't know.

Q. You know they are in existence?

A. There are such papers; yes, sir.

Q. On page 8 of your exhibit, the caption, "Inventory of the Company's Properties as of December 31, 1938,—" did you make a check to determine whether the items of property listed in your inventory are used and useful in the Hope Company's Export business?

A. No, sir; I did not.

Q. Did you rely on someone else's determination?

A. The inventory as used in the original cost is the inventory of the properties existing at December 31, 1938, and recorded on

the Company's books, and I was instructed by the Company to include all properties so recorded, unless the Company advised me otherwise.

1189 Q. Who gave you the instruction?

A. The management of the Company.

Q. Would that be one person or several?

A. Mr. Chisler, who is the Vice President and Treasurer of the Company, and Mr. Cross, one of his assistants.

Q. In Paragraph B on Page 8, you say that your book inventory was checked account by account against all other available records. Could you tell us the general office and field office records which you used to check the book inventory account by account?

A. In the general office, we checked all of the records available in the Geological Department, such as well pockets and well cards. Information in the engineering department, such as surveys, line maps, and line pockets, and information in the district offices such as line pockets and all miscellaneous records.

Q. Did you make a check on the working papers under the previous re-classifications?

A. No, it was not necessary.

Q. Have all of those records been made available to the Commission's staff?

A. Yes, sir.

Q. On page 9, Mr. Antonelli, you state that substantially all visible property was verified by field inspection as to its
1190 existence and description. What dollar per cent does the visible property bear to the total property in the Hope system?

* * *

The WITNESS. The invisible properties consist of gas wells and pipe lines. They are the large items, and that represents about 7 per cent of the total properties.

By Mr. SPRINGER:

Q. You would say then that approximately 25 per cent of the property could be visually inspected?

A. Yes; the visible property, the visible properties.

Q. How much money is that?

A. About $55,000,000 original cost.

Q. And $55,000,000 could not be seen?

A. Could not be seen.

1191 Q. On page 9, you state that buried pipe was checked in the field by sampling method as to its existence and description. Would you describe the sampling method and the extent used?

A. This sampling method was done during the time the pipe was examined for condition, and as I understand it, the pipe was uncovered at equal intervals and examined.

Q. Just as Mr. Rhodes described?

A. Yes, sir.

Q. You relied on that?

A. Yes, sir.

Q. Would that furnish information as to the description of the pipe?

A. It will give the size of the pipe.

Q. And the length, of course, could not be determined by the sampling method?

A. No; we did not attempt to determine the length by the sampling method, no.

Q. I thought your statement was that you checked for description as well as existence?

A. Yes.

Q. And the length and size would be a description?

A. Through the sampling method we were able to determine the kind of pipe, whether it was a steel pipe, or a plain-end

1192 pipe, or what. In most of the cases—not in each case.

Q. The sampling method would not give you the complete answer, would it?

A. No, sir.

Q. Now, on page 9, you state that the book inventory was corrected to reflect only property in existence at December 31, 1938. Will you state the number of actual adjustments made to the book inventory by reason of the sampling method used for buried pipe, and the total effect in terms of dollars from those adjustments?

A. I could not do that. That is quite a job. I could prepare a statement.

* * *

Q. Were there numerous adjustments, Mr. Antonelli?

A. Yes, sir; there were. Some of them very minor, but there were adjustments.

Q. Both for inclusion and exclusion of pipe?

A. Yes, sir.

Q. Could you estimate the amount of money involved?

A. No, sir; I could not.

Q. On page 9, you state that in connection with the field
1193 field check of compressor station structures and equipment, you say use was made of an agreed inventory used in 1931 in the East Ohio-Cleveland Rate Case before the Ohio Commission. Do you know who made the 1931 inventory?

A. That inventory was prepared by Ford, Bacon & Davis.

Q. Was it a complete physical inventory?

A. It was a complete physical inventory, as of December 31, 1931.

Q. Can a physical inventory be made of the Hope system?

A. I am referring now to compressing stations, structures and equipment.

* * *

Q. On page 9, do you have the schedules which reflect additions and retirements to 1938, which have been applied to the 1931 inventory?

A. Yes, I have, and a copy of those schedules was furnished to the Federal Power Commission.

Q. To whom?

A. Mr. Lyons.

Q. On page 9 again, Mr. Antonelli, you state that additions and betterments from June 30th, 1931 to December 31, 1938, occurred in the field. How was that field check accom-
1194 plished?

A. By visiting each station and checking each item individually. The items that were not found there were retired, and other items that were found and not recorded in the inventory——

Q. (Interrupting.) Do you mean that you can go out in the field and look at property and tell whether there is an addition or a retirement involved?

A. By "addition" and "retirement" I mean we added additional items and retired others.

Q. Were you able to distinguish from former additions and former retirements?

A. I don't understand what you mean by "former additions and former retirements."

Q. Did you say you looked at the property in the field?

A. Yes, sir. All of the visible property was examined.

Q. Well then, how can you distinguish your additions and retirements from ones that were formerly made?

A. I don't understand what you have in mind. We had an inventory as of June 30th, 1931. This inventory was taken out in the field and checked, item by item. If we did not find the items in the field as recorded in our inventory, of course, we retired that item.

The TRIAL EXAMINER. You had an inventory of each
1195 compressor station, you mean?

The WITNESS. Yes, sir; of each compressor station. If we found an item in the field that was not recorded on our inventory, it was added.

Mr. MILDE. By "retired" you do not mean retired in an accounting sense, do you? I think that is where the difficulty is.

The WITNESS. No, sir; I mean it was eliminated from our inventory.

The TRIAL EXAMINER. You mean it was not there when you went back?

The WITNESS. That is right. It was not there when we went back in 1938 and 1939. It was there in 1931.

Mr. COCKLEY. Then you took it off your list?

The WITNESS. Yes; we took it off the list.

Mr. COCKLEY. And if you found something there that was not on your list, you put it on?

The WITNESS. Yes; that is the way we did it.

Mr. COCKLEY. And of course, you could not put anything on but a bare description of the equipment?

The WITNESS. That is all that was necessary, to put the description on so that we could identify it from the Company's books and vouchers.

By Mr. SPRINGER:

1196 Q. Did you reconcile that information with the book cost then?

A. Yes, sir; at the time that we went in the field, in addition to the 1931 inventory, we also had with us a transcript of the inventory as shown on the Company's books, and those two inventories were reconciled.

Q. You mean they were reconciled as to the existence of the units of property, or the dollar basis?

A. As to the existence of the units of property.

Q. Should there not be a reconciliation of the related dollars to the units of property added or retired?

A. The books do not reflect the complete original costs. It records only the book costs. We did not pay much attention to the dollars as shown on the books because they were not complete.

Q. You had a total dollar amount and you fitted what you call a check inventory into it without relating dollars to the units of property, is that right?

A. No, we prepared an inventory, and then we went to the Company's records, not only the Company's ledgers, but all of the Company's records, and we went back into the vouchers and found the actual costs of the amount of money that the Company actually spent to construct these properties.

Q. Are the Company's records adequate to enable you
1197 to determine the total cost to the company of compressor stations?

A. Yes, sir.

Q. Will you please refer to the last paragraph on page 9. What is the original source of the inventory of the pipe lines you mention there?

A. The inventory of the pipe lines was a transcription from the company ledgers checked against the information and data shown in the engineering department, and what is shown in the various districts, line pockets, and so on, and also survey maps and survey plats. Of course, they were spot-checked out in the field to determine their accuracy.

Q. Who determined when it was necessary to confirm the accuracy of the inventory data on hand?

A. I did. I made sure that the inventory was as accurate as humanly possible.

Q. Would you please describe the extent and nature of the new surveys which were made to confirm the accuracy of the pipeline inventories?

A. We prepared a list of all lines, line by line, and our first job was to go out in the field in each district and have all of the line-walkers come in, and we discussed the existence of these
lines. That was our first step. For instance, I would
1198 ask a man, "Do you know anything about a certain line?" and he would say "Yes, this line is still there." And I would ask him, "How long is the line?" and he will say, "1,000 feet." If he said it was four miles, I knew that there was something wrong. So that was our first check. Then a discrepancy of that kind was checked in the field by actual measures.

The next check was by setting out on parallel columns the inventory lines as shown by the engineering department and as shown by the treasurer's department, and the discrepancies were noted, and if it could not be explained, they were checked out in the field by actual measurements.

We also checked the inventories with the surveys made by the engineering department and line plats. When a line is laid, there is a plat prepared showing the length of the line and the kind of the line, the beginning point and the end.

Q. And how can you make an actual measurement of a pipe line?

A. By measuring the line with a chain.

Q. With a chain on top of the ground?

A. Yes.

Q. Do you penetrate?

A. No; you just follow the line.

Q. Could you tell us how many miles were measured that way?

1199 A. I am not quite sure, but I think it was about ten or fifteen per cent.

Q. Of the 4,000 miles?

A. Yes, sir. It was not necessary to measure all of the lines where we were certain that the inventory was correct. We measured all of the lines on which we were in doubt.

Q. And you say that that was about 15 per cent of the 4,000 miles of pipe lines?

A. Offhand I would say that is correct. I would have to refer to my papers to find the correct amount.

* * *

Q. Could you have the papers here late today and give us the correct answer on that?

A. Yes, sir.

Q. Will you please turn to page 10 of Exhibit 20 and referring to paragraph D, were you able to identify in the transcription of investment ledgers, the specific units of physical property shown in the new inventories made in the field as of December 31, 1938?

A. In most cases, we did. In some of the general accounts, particularly in the shop equipment, we were unable 1200 to identify the items found in the field with the items shown on the company's ledgers, but of course that is only a very small portion of the properties involved.

Q. In the case of pipe and fittings at a compressor station, if you could not find it at the time of the field check, did you put it under construction labor and class it as supplies expended during construction?

* * *

The WITNESS. I will have to refer to my papers to answer that question.

By Mr. SPRINGER:

Q. And on page 10 again, what is the dollar amount of your adjustments, in connection with the property no longer in existence which was still carried on the company's books?

A. Again I will have to refer to my papers, Mr. Springer. I could not answer that question offhand.

Q. You would not know the dollar amount of your adjustments in connection with property found by field check which had not been recorded on the books?

A. No, sir, that would be a big job to determine.

Q. Was it a large amount?

A. I would not say so; no, sir.

* * *

1201 Q. The Trial Examiner and the Federal Power Commission would not be expected to get the answer that way, would they?

A. Of course, in order to get the answer to these questions, it would require me to go over 70,000 pages and summarize them. It is a tremendous job, because they are shown by units of property. They are all there and all explained, and the reasons why the adjustments were made.

Q. You did not make any summaries for your own information?

A. I have the adjustments shown on this statement B.

Q. You do not know how much property you added to that inventory which was in existence which did not appear on the Company's books?

A. Not offhand; no, sir.

Q. Your working papers won't show that in summary form?

1202 A. Yes, sir; Statement C gives the various kinds of adjustments, but not as specifically as you would like to have them.

* * *

1205 Q. Mr. Antonelli, referring again to the dollar amount
1206 of your adjustments in connection with property no longer in existence which was still carried on the company's books, do you consider that important information?

A. No, sir.

Q. Now, in considering the dollar amount of your adjustments in connection with properties found by field check, which had not been recorded on the books, do you regard that as important information?

A. No, sir; there are not many such properties.

Q. And did you state the amount of money involved in these adjustments?

A. I stated the inventory adjustments, and I also stated the amounts involved reduced the original cost $449,042.39. That is a reduction to the original cost.

Q. That is a net figure?

A. Yes, sir; it is shown on page 34, statement C.

Q. Then there are other columns involved too, aren't there, such as material and labor costs, unloading and hauling, and warehouse handling?

A. Those are a different type of adjustments. I am referring now to the inventory adjustments only.

* * *

1208 Q. Mr. Antonelli, referring to column 6 on page 32 of your exhibit, you have used net figures there, have you?

A. Yes, sir; I did.

Q. And the working sheets do not show the dollar amount of adjustments in summary form, do they? The total dollar amount?

A. The working sheets will give you the total amounts for each account as it appears in statement C.

Q. You have stated that it was net and your working papers do not show the total gross.

A. The working papers show in detail each item added or retired in the inventory, and this is the result of the additions and retirements. The net figure is shown in the statement C, account by account.

The TRIAL EXAMINER. Does it show how you arrived at each amount as related to the original books?

The WITNESS. No. For such information it would be necessary to go back to the working sheets. It does record the amounts added and retired, item by item.

* * *

1209 Q. You have stated, Mr. Antonelli, I believe, that the dollar amount of your adjustments, in connection with property no longer in existence, which was still carried on the
1210 Company's books, was not important?

A. Not as far as dollars is concerned.

Q. Well, what do you mean? That $1,000,000 is not important?

A. I would not say that it was $1,000,000. It was not $1,000,000.

The TRIAL EXAMINER. Is it half a million dollars?

The WITNESS. I am not quite sure, but it is less than half a million dollars. I would have to look it up, because I cannot remember the figure.

By Mr. SPRINGER:

Q. In reference to the dollar amount of your adjustments in connection with the property found by field check, which had not been recorded on the books, you said also that you did not think that was important. Is that a million dollars?

A. Oh, no; it is a small amount. I am not sure—I don't know how much, but it is not a million dollars.

Mr. SPRINGER. Mr. Examiner, we renew our request for the tabulation showing the dollar amount of adjustments in connection with property no longer in existence which was still carried on the Company's books, and the dollar amount of adjustments in connection with property found by the field check, which had not been recorded on the books?

* * *

1212 Q. Would it require much work to prepare that tabulation?

A. After you see these work sheets, perhaps you will be satisfied with what we have. I believe they will show just what you wish.

Q. You will be able to testify to it from your sheets then?

A. I think so.

Q. Please refer to page 10 of your exhibit. How could property exist that was not recorded on the Company's books?

A. There is a lot of property that is not recorded on the Company's books and still it is in the field and owned by the Company.

Q. Does that mean that the property was in existence but it did not show in the plant accounts, and probably has been charged to operating expenses?

A. What property do you have in mind?

Q. How does property exist which does not show on the
1213 Company's books? What causes that? Is that an omission?

A. No; it might be that during the re-classification of accounts, certain properties were missed, or it might have been charged to expenses, although only a small portion of the properties are charged to expense.

Q. You mean the former reclassifications, do you not?

A. Yes; I mean the former reclassifications.

Q. Of 1929 and 1932?

A. Yes; sir.

Q. On statement B at page 31, you show the restated original cost of operated leaseholds, gas rights and royalties, totalling $1,684,635. Will you state the amount which was added to book costs to get that result?

A. The amount added to the books to get that result would be the difference between $1,684,635.98 and $1,331,100.55.

Q. Will you explain in detail how you determined the original cost of operated leaseholds, gas rights and royalties for each of the columns across page 31?

A. Column 4 was obtained from the financial statement. That is the amount shown in the financial statement for operated leases.

Column 12 was determined by adding the costs to the Hope Company, exclusive of the expense items and overhead, of the first lease acquired from other utilities.

1214 Column 5 was obtained by subtracting Column 12 from Column 4, and it is not supported by detailed leases adding up to the total of the column. This column was just a balancing figure.

Column 6 is the difference between the original cost of the leases and the book cost as shown on the Hope Company's financial statement.

Q. Column 6 is the difference between the figures and what other columns on page 31?

A. Column 5 plus column 6 plus column 12 and less column 4 will give you column 6.

The TRIAL EXAMINER. Will you repeat that answer, Mr. Reporter?

(The answer is repeated.)

The WITNESS. It is the original cost—it is the difference between the original cost of the leases, which is column 5, column

6 and colun 2, less the cost capitalized on the company's books of column 4, and that will determine the original cost of the leases to be $1,583,852.73 and the cost capitalized on the books is $1,331,100.55. The difference represents the inventory—no; it represents the adjustment, which is $252,752.18.

By Mr. SPRINGER:

Q. Is that sum of $252,752.18 under column 6 also a
1215 balancing figure?

A. No; that is an adjustment that had to be made on the books, in order to obtain the adjusted book cost of the operated leases.

Q. Is that supported by detail of the leases?

A. The detail? The total original cost is of the operated leases and is supported by detailed vouchers.

Q. Is the amount of $252,752.18 in column 6 supported by detailed leases?

A. That is only an adjustment.

Q. It is a balancing figure, is it not?

A. Well, you might call it a balancing figure. The original cost of the operated leases is $1,583,852 and the leases on the books are recorded at $1,331,100. The difference had to be shown under an adjustment, and that represents the $252,752.

Q. Will you explain how you determined direct material and labor costs not capitalized for operated leaseholds, gas rights and royalties?

A. I don't understand your question.

Mr. SPRINGER. I will ask the Reporter to repeat the question.

(The question is repeated.)

The WITNESS. Well, the leasehold consideration has
1216 always been capitalized, and only cost of obtaining for the years prior to 1921 were expensed, and also some of the recording was expensed, but most of the leasehold costs were capitalized. The items that were expensed were determined by ascertaining how much the company actually paid for such leases through vouchers and Company records.

By Mr. SPRINGER:

Q. Could you tell us how you arrived at the $64,398.61 in column 7 for direct material and labor costs, not capitalized, relating to operated leaseholds?

A. This amount comprises the cost of obtaining—and by the cost of obtaining, I mean the cost of the agent going out in the

field to acquire leases. I think it also includes certain recording charges. In some cases we were able to find the actual costs through vouchers. In other cases part of this $64,000 was estimated on the known costs of the other leases. By that I mean we knew how much it cost to obtain a lease by study of 3,700 or 3,800 leases, and we used that cost to estimate the cost of the leases that we did not know.

Q. Were the conditions comparable during the period that you have stated, to the test costs, which you used in your estimates?

A. This cost of obtaining price which we used as an estimated price, was based on leases purchased or acquired after 1217. 1921, and was used for the cost of obtaining Hope Company leases purchased prior to 1921. Although the wages paid by the Hope Company after 1921 were higher than prior to 1921, the transportation after 1921 was very accessible, and offsets the difficult transportation prior to 1921. The means of going from one place to another to see the various farm owners was not very good prior to 1921, and it took three or four or five times as long to reach a farmer prior to 1921 as it did after 1921.

Q. Now, Mr. Antonelli, will you please refer to the unoperated leases, gas rights and royalties, on page 31, with the restated original cost $681,882 and state the amount which was added to the book cost to get that result?

A. We had to add the amount shown on column 6, namely $104,881.48.

Q. Is that a balancing figure?

A. You may call it so. It is an adjustment figure.

Q. What is your description of an adjustment figure?

A. It is the difference between the original cost and the book cost, in order to balance with the books in column 4, we had to show this adjustment in the next column. It does not mean anything, as far as that is concerned—it is just an adjustment figure. It was shown just for the purpose so that we could balance with the Company's books, and it really has no
1218 effect on the original cost whatsoever.

Q. Now, will you please explain in detail how you determined the original costs for each of the other items of cost at page 31 for unoperated leaseholds, gas rights and royalties?

* * *

A. It was determined from the Company's records and vouchers.

Q. Starting with column 4.

A. It would be exactly the same way as I described it for the operated leases.

Q. On page 12, you state that all actual material and labor costs of the property in existence in 1938 which had been charged to expense were recorded on the original cost sheets. How did you determine the actual material and labor costs?

A. The actual material and labor costs were ascertained by finding out exactly how much money the Company spent
1219 in constructing these properties. It is the actual cost that the Company spent for constructing these properties, and it was determined from the Company's vouchers and the Company's records.

Q. Were you able to find all of the vouchers required for your actual determination of the materials and labor costs?

A. I was not able to find all of the vouchers, but I was able to find vouchers to the extent of 93 or 94 percent of the original costs of the properties, as I stated before.

Q. And then you estimated the remainder?

A. I estimated the remainder, based on the Hope Company's costs for constructing similar properties under similar circumstances and for like periods.

Q. Of the vouchers you did find, what method did you use to identify any operating expense costs relating to the costs of existing properties?

A. I don't understand your question.

Q. Was it possible for you to tie the existing property up with the old vouchers which were recording these items as operating expenses?

A. I still don't understand it, but what I did in connection with the items that were charged to operating expenses—I went to the Company records——

* * *

1220 The WITNESS. I went to the Company records and the Company vouchers, and determined the actual costs of these items, irrespective of the charge to capital or expense.

The TRIAL EXAMINER. The voucher in each case did not cover the particular expense that you were looking for, did it?

The WITNESS. Yes, sir; each item was identified by a voucher, and my job was to find the particular voucher and identify it.

The TRIAL EXAMINER. The voucher covered only that expense and nothing else?

The WITNESS. Yes, sir. The voucher for each item of equipment and each item of expense.

By Mr. SPRINGER:

Q. Was the voucher sufficiently complete to enable you to identify the unit of property existing today and relate the expense to that unit of property?

A. Yes, sir.

Q. In every case?

A. In most cases. For instance, if I am looking for
1221 the cost of this table [indicating], the table is numbered, and I go to the voucher and look for this number and look for the description of this table, and that is the cost of this table.

The TRIAL EXAMINER. That would be the cost of the table alone, without respect to any labor or hauling or freightage or anything else which expense might have been incurred in connection with that table. Would that same thing apply to freight on the table, for instance, haulage on the table?

The WITNESS. Yes, sir.

The TRIAL EXAMINER. Or labor on the table?

The WITNESS. Yes, sir.

The TRIAL EXAMINER. You would find a separate voucher for each of those items?

The WITNESS. Yes, sir.

By Mr. SPRINGER:

Q. On page 12, Mr. Antonelli, it is true that the direct cost of the materials and labor totalling $13,580,814.33 which you have added to the book cost of the property were formerly charged to operating expenses?

* * *

1222 The WITNESS. Yes, sir, that is true.

By Mr. SPRINGER:

Q. When was the practice of capitalizing direct costs of material and labor begun by the Hope Company?

A. For certain accounts, the Company capitalized labor from its inception. For gas well construction, of course, they did not capitalize until later on in 1923. For certain of the pipe lines prior to 1907, the labor was not capitalized. The labor for transmission lines and main lines was always capitalized.

Q. What is the basis for your determination that the items formerly charged to operating expenses should be restated as

capital items which you have described as direct material and labor costs not capitalized?

A. Well, this was done in order to obtain the complete original costs. The true original cost.

Q. Under the instructions of the Classification of Accounts of the State of West Virginia for 1939?

A. Under the accounting principles of the classification of accounts.

Q. Regardless of the former decisions of management to
1223 account for these items?

A. (No answer.)

Q. Haven't you said that you did not care how they accounted for them formerly?

A. Yes, sir.

Q. But you were out to determine the original cost, under your conception of what that means?

A. I was out to determine the true and real original cost of this property.

Q. Pardon me, Mr. Antonelli. Will you please refer to page 31 of your exhibit. I did not mean to interrupt you when you were telling when the Company started to capitalize direct material and labor costs for each of the classifications of the property listed on that page. You have explained some of those; will you continue now?

A. Shall I begin on Account No. 300-1 and go down?

Q. If you will, please.

A. Land was always capitalized by the Company, and the only items that were charged to expense were certain abstracting costs. It will be very hard for me to give you a definite answer for each account, but generally speaking, materials were always capitalized. Labor for compressing station equipment and structures was always capitalized, except, I believe for the years 1918
1224 to 1922. That is true for field lines, although certain lines prior to 1907, the labor was not capitalized. Certain of the rights-of-way costs such as the cost of obtaining was not capitalized prior to 1920. I think that about covers everything.

Q. Was it the discretion of the management to account for those items in the manner that you have described?

Mr. MILDE. I object to that. How can he testify as to what the management thought back in those times? He was not there twenty or thirty or forty years ago. What do you mean by your question?

The TRIAL EXAMINER. What do you mean by "Within the discretion of the management?"

By Mr. SPRINGER:

Q. Well, some decision had to be made, Mr. Antonelli, did it not, as to whether they should be capital or expense items?

A. I was not interested in that. I said that before, that my job was just to determine the original cost, the real original cost, irrespective of what the company did in the past.

Q. Then your answers would be the same relating to the costs of material and labor and the accounting of the Company as they were for the item of well-construction costs, when I asked
1225 you about intentional and informed accounting, during the history of the Company?

A. Yes, sir.

Q. On page 12, you state that you made an analysis of the costs experienced by the Company in what you term unloading, hauling and warehouse handling costs, and indirect field costs. What period of time did your analysis cover?

A. It covered from the beginning of the existence of the Company up to 1938. It covers the entire period of the Company's existence.

Q. On page 38, don't you talk about dress rehearsals?

A. Yes, sir.

Q. Field performances for unloading, hauling, and warehouse handling, were determined by rehearsals?

A. Yes, sir.

Q. What instructions were given to the men who played the parts in that case?

A. There were no instructions given. I sent one of my men that is familiar with warehousing handling, unloading, and hauling, and he spent several months going from one warehouse to another warehouse, interviewing all of the present employees, the past employees, going through the Company's records, and checking certain information, and also making time studies as to what was done in that time.

Q. What check did you make to determine that the con-
1226 ditions for the dress rehearsals were comparable to those twenty or thirty or forty years ago when the work was actually performed?

A. Well, these so-called dress rehearsals were comparable to those times when the thing was done twenty or thirty years ago.

with the same conditions, as much as possible, naturally, but that was all one part of the study that we made. We took several months in determining this unloading and hauling and warehouse handling.

Q. Mr. Milde said that you were not here twenty or thirty or forty years ago.

A. The records are here, and we have analyzed the records. We have talked to various employees, that were here twenty years ago. We have their names, and we know exactly what they did, and I am very sure that we obtained very accurate information affecting these types of costs.

Q. Will you please refer to page 38 of your exhibit. What were the available costs from the Company's records which you say substantiated your unloading pipe costs used in this exhibit at your dress rehearsal?

A. The pipe bills and payroll records and tally sheets.

Q. And how did they substantiate that?

A. If we found through actual field investigation that it cost, say fifty cents a ton to unload pipe, then we go to the
1227 records and find that it is about the same, and so we find that the men that gave us that information told us the truth.

Q. Will you please refer to page 12 of your exhibit and state whether the actual costs of unloading, hauling and warehousing and handling for property constructed and purchased as non-operating units by the Hope Company, were formerly charged to operating expenses?

A. If I understand your question, we did not include any unloading, hauling and warehouse handling of properties purchased from non-utilities.

Q. As non-operating units?

A. Yes, sir.

Q. Were the actual costs of unloading, hauling and warehouse handling for property constructed by the Hope Company formerly charged to operating expenses?

A. They were formerly charged to operating expenses, yes, sir.

Q. Then on page 32 of your Exhibit, that means that $383,454.28 has been added to the book costs as an estimate of the unloading, hauling and warehouse handling costs?

A. $383,454.28, yes.

* * *

1228 Q. And none of that related to properties purchased from non-utilities as non-operating units?

A. May I correct my previous statement, please? This amount was added to our original costs to determine the correct original cost. It was not added to the books; it was added to our original costs. It is part of our original cost.

Q. And what is your original cost?

A. The original cost is $70,000,000 which we determined for the original costs of the Hope Company properties.

Q. What do you mean when you say that you have added it to your original costs?

A. It is part of the original cost.

1229 The Trial Examiner. You do not mean you added it to that $70,000,000, do you?

The Witness. No, I do not. It is part of the $70,000,000.

The Trial Examiner. What did you add it to to make the $70,000,000? I think that is what he is trying to find out.

The Witness. This $383,000 was added as the unloading, hauling and warehouse handling of the casing and tubing and the pipe that went into the construction of the field lines.

The Trial Examiner. That is what it was added for?

The Witness. It was added for the costs of unloading and hauling and warehouse handling of the pipe. It was not added to the book cost.

The Trial Examiner. What was it added to?

The Witness. It was added to the material for casing and tubing and pipe lines and field lines.

Mr. Milde. Material costs.

The Witness. Material costs.

By Mr. Springer:

Q. Was it added to the $49,000,000 amount in column 5, page 32, which is captioned "Per books?"

A. No, sir; it was added to the material costs as determined by us to be the original costs of our casing and tubing and field line pipe.

1230 Q. What was your starting point for the determination of that term original cost?

A. My starting point was to find out the amount of money the Company actually spent for material and labor for unloading and hauling and warehouse handling charges, and the indirect field costs and overhead costs, which gave me the complete cost, the complete original cost of the Company's properties.

Q. How did you do that?

A. I did it, as I have already explained, by analyzing the Company's records and vouchers and so on, and digging in the records which I found.

Q. Well now, Mr. Antonelli, does the original cost statement that you have made have any relation to the book cost?

A. No, sir; the book cost is shown here only to show you what is shown on the books, and of course, to show the adjustments and where we found the costs, how much of it was capitalized and how much was expensed. I wanted to make a job that would be clear to everybody and that would show just exactly where we got the information. And at the same time, to tie it up with the books.

The TRIAL EXAMINER. The purpose of putting the book cost in this exhibit, then, was to relate the book costs to your results?

The WITNESS. Yes. We started with the book cost, and
1231 they made certain adjustments to it, and then we added some other costs which we found.

The TRIAL EXAMINER. Actually you did not do that? You did not start with the book cost, other than to just make a record of the book costs, and then you went ahead and made a separate determination?

The WITNESS. I started it with an inventory. On the first column of the inventory, I showed what was shown on the books for each item separately. Then on the next column I showed the adjustments upwards or downwards, whether I had to increase the book costs or decrease the book costs.

The TRIAL EXAMINER. That was simply to relate your results, as I say, to the book costs?

The WITNESS. Yes, sir.

By Mr. SPRINGER:

Q. You started with book costs?

A. I started with book costs, yes, sir; in most cases.

Q. And is your so-called original cost classification an appraisal of the Hope System properties?

A. Oh, no. This original cost is the cost of the property, the actual cost of this property.

Q. What is your definition of "original cost?"

A. My definition of original cost would be the full cost of constructing the properties involved.

1232 Q. Is that the basis for your original cost figure?

A. No; this definition was modified to agree with the definition given on page 5 of the new Code of Accounts pre-

scribed by the West Virginia Commission, namely, that the original cost as applied to gas utilities, means the cost to the person first devoting it to the public service.

Q. And what are the elements of that cost?

A. I don't understand what you mean.

Q. Does it include labor and material?

A. It includes the full costs. It includes the labor and the material and any other charges and expense which might have been incurred in connection with the construction of the properties.

Q. You have restated, have you not, Mr. Antonelli, in your original cost statement, items which were charged to operating expenses since 1923, for example, that you have now capitalized?

A. Since 1923?

Q. Yes.

A. I cannot answer that question offhand, but I know that I determined the original cost, and if the Company has expensed certain items since 1923, I have not paid any attention to them. I determined the original cost, irrespective of what the Company did.

Q. Well, as a matter of fact, you have capitalized items
1233 which the Company, since 1923, has charged to operating expenses, haven't you?

A. It is possible, but such items would be very small in amount.

Q. Well, it has actually been done, hasn't it? What do you means by "a small amount?"

A. It might be a small structure expensed by the Company. For instance, a gate-house costing $50. or $60.

Q. That is contrary to the instructions of the West Virginia system of accounts, is it not, which says that it was not intended that items formerly charged to operating expenses should be capitalized?

Mr. MILDE. I object to that. It does not say that.

Mr. SPRINGER. On page 48, in Section B.

The WITNESS. As I said before, I determined the complete original costs of the properties, regardless of paragraph B on page 48.

By Mr. SPRINGER:

Q. You ignored that instruction?

A. Yes, because it is inconsistent with what is stated in Paragraph C and inconsistent with the definition of original cost.

Q. Why do you think that it is inconsistent?

A. Because the definition of original cost was interpreted
1234 by me to mean the full original cost for construction of the property, and also in Paragraph C, page 48, it states that if the original cost is not available, it could be estimated.

Q. How does that change the specific provision of the items formerly charged to operating expenses, that they should not be capitalized?

* * *

Q. Mr. Antonelli, did you not state on page 5 of your exhibit, that under the new uniform system of accounts of West Virginia, it was required to state plant accounts on the basis of original costs of the property?

1235 A. Yes, sir.

Q. And have you made your original cost statement in conformity with the instructions and prescriptions in that uniform system of accounts?

A. I made it in accordance with the accounting principles set forth in the new Code of Accounts.

Q. What do you mean by the "accounting principles?"

A. Well, I reclassified the properties in accordance with this new Code of Accounts, and showed the material and labor for each item of property in connection with this new Code of Accounts and determined the original costs of the properties.

Q. Were any interpretations required before you could undertake your work?

A. Required from whom?

Q. Any interpretations of the principles of accounting which you say you relied upon?

A. Well, I interpreted it to mean that in order to determine the original cost of the properties, I had to determine the full costs.

Q. Have you stated in your qualifications that you were an expert accountant?

A. What do you mean by an accountant?

Q. Are you a Certified Public Accountant?

1236 A. No, sir; I am not.

Q. Have you ever been an auditor?

A. What do you mean by an auditor? I don't understand just what you mean by an auditor.

Q. Have you an accounting degree, that you have been trained in the science of accounting?

A. No, sir.

Q. And you did not need any accounting advice to assist you in making your determinations of how to make an original cost study based upon what you call the principles in the West Virginia system of accounts?

A. I had as many as 180 men working on this job. We had engineers and accountants and clerks.

Q. Did you receive accounting advice on the principles or the interpretation of the uniform system of accounts?

A. I did; yes, sir.

Q. From whom?

A. By reading this new Code of Accounts, and from various accountants that worked under me, and also from the Company.

Q. Who in the employ of the Company advised you in the principles of accounting?

A. Various employees. Mr. Cross, Mr. Chisler.

Q. And you accepted their advice, I take it?

A. Yes, sir; I did. May I say that this determination of
1237 original cost is more than an accounting job? Before you prepare the original cost, you have to prepare an inventory and you have to know what is in the inventory, and then the man that works on this original cost must know costs. An accountant knows figures but not costs.

* * *

1253 Q. Did you state earlier in your testimony that the determination of the original cost is an exact science?

A. I said it would be an exact science, if it is possible to find the actual cost on the Company's books and records.

Q. Is that an accounting or an engineering problem?

A. It is both. You have to know the items and you have to know the costs. I personally think it is more of an engineering problem than an accounting problem, and my experience in the last twenty years has been that original costs prepared
1254 under the direction of an engineer are the more accurate original costs, because the engineer knows what he is talking about so far as the physical property is concerned.

The TRIAL EXAMINER. He may not know what the accountant is talking about, as far as the books are concerned?

The WITNESS. I was not interested in the books; I was trying to find out the original cost. Here is a chair, and I was trying to find out how much the chair cost. It is a detective job, really, to go to the books and find out the cost of the chair and identify it, and so that I can prove to somebody that the cost of this chair

is $10. That is what we did. I was not interested at all in the way that the Company kept their books or what their practices were.

By Mr. SPRINGER:

Q. Please turn to page 12 of your exhibit. How did you determine the indirect field costs in your study?

A. The method followed is described.

Q. Is that on page 39?

A. It is on page 39, I believe.

Q. And on page 39, you say that present and former superintendents were interviewed, in order to learn actual account of the average time spent in the previous field construction. Did those superintendents have written records of their time spent on construction, or did they rely on their memories for
1255 this thirty or forty year old information?

A. They relied on their memories. If they had written records, of course, I was going to use them, but there were no such written records.

Q. And you relied solely on their memory of conditions forty years ago?

A. Well, those men, doing the same work year after year, they know very well how much time they spent in connection with the construction of pipe lines or drilling wells, and so forth. It is a very easy matter for them to give me a correct picture of the time spent in constructing properties.

Q. The men you interviewed have not been employed in that task for forty years, have they?

A. No, sir; I interviewed all of the men from the beginning up to 1938, all of the men that were available and still living.

Q. Of the men available, were there any who had supervised field construction forty years ago?

A. No; but many supervised field construction for a long time, and those men are men that grew up in the business, and they know how much time is necessary for supervision, even before they began supervising.

Q. And did you make a check of your determination to see whether it was in compliance with the cost of supervising field construction twenty to forty years ago, when it was
1256 actually performed?

A. Well, the costs that were determined as applicable to those dates, are not applicable to the supervision of today. These costs vary year by year, and it was so determined.

Q. Now, did you determine in 1938 what the cost of supervising field construction was in 1915?

A. We determined the salaries and expenses of the men that supervised the work in 1915. There was no trouble about that. We had that directly.

Q. You mean that field supervision and construction——

A. (Interrupting.) Yes, sir; name by name. I have the names of the men who supervised the work in 1915, down to the time-keeper, and I also knew and determined from the men that really did the work in 1915, how much time they spent in supervision. There was no trouble at all to determine the cost.

Q. Do you remember that man's name?

A. Oh, yes; I have several—not one man's, but I have several men's names. It may be twenty or thirty or it may be as many as fifty. We spent months doing this work. We visited every district and interviewed every man and reviewed all of the pay-roll vouchers and pay-roll books.

Q. And were the actual indirect field costs for the properties constructed or purchased from nonutilities or from other
1257 utilities, which not operating units of the system, formerly charged to operating expenses?

A. I don't understand your question.

Mr. SPRINGER. I will ask the reporter to repeat the question.

(The question is repeated.)

The WITNESS. The original cost did not include indirect field costs for such properties.

By Mr. SPRINGER:

Q. Does the indirect field costs which were actually incurred for the property constructed by the Hope Company, were they formerly charged to operating expenses?

A. Yes, sir; they were.

Q. Do you mean, Mr. Antonelli, that the only addition in your original cost statement of indirect field costs was made to property constructed by the Hope Company?

A. We also added indirect field costs to properties constructed by other utilities.

Q. You mean that it covered the properties purchased by the Hope Company from other utilities as an operating unit?

A. Yes, sir.

* * *

1258 Q. Mr. Antonelli, you stated that the Hope Company in the past has charged indirect field costs to operating expenses?

A. Yes, I did.

Q. And I assumed that that was intentional accounting on the part of the company?

A. I don't know what was the company's intention.

Q. Well, it was a fact, was it not, that you found that they had practiced the expensing of indirect field costs?

A. They were charged to operating expenses.

Q. And could you tell us for what period they were charged to operating expenses?

A. No, I could not. But I would like to make a statement that we are referring now to just certain accounts, and not
1259 all of the accounts. We are referring to gas wells and field lines. For the other accounts, the Company has charged indirect field costs direct to the properties.

Q. Do you know whether that was done since 1922?

A. I would say offhand; no, sir.

Q. You have added to your book costs an estimate of overhead costs totalling $2,866,414.26 for property constructed or purchased from nonutilities or as nonoperating units, haven't you?

A. I have not added anything to the book costs. I determined the original costs, and this amount represents the overhead.

Q. On page 13 you state that to determine the original cost of the company's properties in accordance with the accounting principles set out in the West Virginia system of accounts, it was necessary to determine the overhead costs in connection with construction and acquisition of properties. Now, referring to the West Virginia system of accounts, page 55, plant construction, No. 6, will you please read that into the record?

A. You mean as to overhead construction costs?

Q. Yes.

The TRIAL EXAMINER. That is already an exhibit. Why read it into the record again?

1260 Mr. SPRINGER. I want to refer to the language.

By Mr. SPRINGER:

Q. Does not paragraph B of that instruction on overhead construction costs forbid the addition to utility plant accounts such as you estimated for overhead?

A. First of all, my overheads are not estimated overheads; they are actual overheads, and not estimated. The only estimate that we had to make was the allocation between operation and new construction work.

Q. How did you determine the actual overhead costs?

A. We determined them from an analysis of the Company's books. Somebody had to supervise and plan the new construction work, and it was based on the Company records.

Q. Do you mean that the Company records are sufficiently specific to permit a segregation retroactively of overhead construction costs?

A. It was segregated by us on an equal dollar basis between operation and new construction work.

Q. Well, that is an estimate, is it not?

A. No; that is an allocation, and it is a very reasonable and fair allocation. As a matter of fact, I think the supervisory forces of the Company spent more time in connection with new construction work than they do with regular operation, which is just routine work.

1261 Q. What is the difference between an allocation and an estimate?

A. An allocation is when you know the total cost and you allocate it between certain things, while an estimate is where you actually have to estimate it.

Q. Could you make an allocation without making an estimate?

A. Yes.

Q. How?

A. If the Company spends $6,000,000 for operation and $4,000,000 for construction, the overheads would be 60 percent operation and 40 percent construction. That is just an example. It is very easy. It is all done on an equal dollar basis.

Q. Are you responsible for all of the statements made in connection with your study of overhead construction costs?

A. No, sir; I had discussions with the management of the Company and with the company lawyers.

Q. What instructions or advice did they give you?

A. I don't recall the specific instructions, but we decided that this was the only method by which we could determine the fair overheads applicable to the Hope Company properties.

* * *

1262 Q. Now, Mr. Antonelli, on page 13, on the subject of overhead costs, referring to group four, general overhead,

consisting of general administrative, legal, accounting and engineering service, and in detail on page 44, you state that some engineering expenditures were included by the Company in the investments, and that you did not use those expenditures in determining these overheads. Are those engineering expenditures still included in investments?

A. Yes, they are.

Q. In addition to your claim for engineering service overheads?

A. Well, there is no duplication between the engineering that has been charged to investment and engineering that has been expensed, but charged to operation. If it is charged to investment, it is still in investment and it has not been taken into consideration in determining the overheads.

Q. How could you determine there was no duplication?

A. Well, because the Company does not make a practice to charge the time of a supervisor in two places. They charge it to expense or charge it to investments. We have checked it and we know.

1263 Q. You have checked every entry?

A. Absolutely.

Q. Then this could not occur, you say, that if engineering and supervision were in the past capitalized and shown in the investment, that you have in your overhead cost statement added something for the same engineering and supervision?

A. No, sir.

Q. And you have checked every entry, to be sure?

A. Absolutely.

Q. In the past, the Company has made an allocation of the engineering expenses between capital and operating expenses, isn't that so?

A. In the past, the company has charged for certain jobs a portion of the time of certain of the men that supervised the construction of the new work: yes, sir.

Q. And that went into investment?

A. That went into investment: yes, sir.

Q. Now, you have come along in your original cost statement and taken the portion of engineering overhead that went to the expense and reallocated some portion of that on top of the investment, which includes the former engineering service?

A. That is not the same engineering. There is no duplication, as I said. Yes, we did, because engineering as was

1264 shown in the investment was not the complete engineering, and that these overheads include more than that engineering. In our engineering is included the administrative costs and the legal costs and the accountants' costs, and those costs are always charged to operating expenses.

Q. My question was confined to engineering supervision.

A. But our general overheads include more than engineering. It includes administrative, legal, accounting and engineering services.

Q. What examination did you make of the time distribution of the engineering department on the basis of which certain costs were allocated to investment by the company?

A. In that case the investigation was done during the examination of the vouchers, to determine the true cost of the operating units that we are trying to get the original cost for.

Mr. SPRINGER. May I have my question repeated?

(The question is repeated.)

The WITNESS. There was no time distribution. If any engineering charges were charged to investment, they were charged directly through vouchers. We did not have to find the time distribution. As a matter of fact there was no time distribution.

1265 By Mr. SPRINGER:

Q. What was the basis of your information for the allocation?

A. The allocation was based on a dollar basis between operating expenses and gross addition to investments.

Q. That was not the basis which the Company used when it originally accounted for engineering?

A. No. Any time that the Company charged engineering to investment, they would charge it directly.

Q. Were you able to determine what engineering services reflected the amounts directly chargeable to operating expenses?

A. No, sir.

Q. How would you be able to reallocate retroactively then the engineering services?

A. I did not allocate just the engineering services; I allocated the general overheads, and the general overheads includes the engineering services.

Q. On pages 43 and 44 of your exhibit, you mention the overheads. Was any portion of the administrative, legal or account-

ing department expenses identified as items 1, 2 and 3, ever allocated to investment by the Company?

A. As far as I know, those charges were never allocated to investment.

Q. On page 44, under the accounting department
1266 functions, you list the preparation of financial statements.

Do you think that the cost of preparing financial statements should be allocated to construction costs?

A. Well, that is only one function of the accounting department, and naturally if the Company lays a line, they will have to make a statement of the conditions. Surely. Why not?

Q. Your answer is "Yes"?

A. Yes, sir.

Q. Do you think that keeping the cash book, showing the receipts and disbursements of the Company funds, and the general ledgers and books, should be allocated to construction account?

A. These are all various functions that the accounting department does, and among those functions are the functions that pertain to the construction of new lines, to keep track of the books, preparing inventories, taking care of the payrolls, and so forth.

Q. Is your answer, Yes?

A. Yes, sir.

Q. Can you quote an accounting authority which would support your conclusion that keeping a cash book and preparing financial statements should be allocated to construction costs?

* * *

1267 The WITNESS. This represents all of the functions of the accounting department, and naturally, we allocate only a certain portion of it to the construction work, but proper estimates for the cash requirements might as well be a part of the new construction work.

By Mr. SPRINGER:

Q. Do you have an accounting authority which would support your statement that preparing financial statements, in part, should be allocated to construction costs?

A. All of this allocation was made after discussion with the management and the accountants of the Company.

Q. Do you mean Mr. Chisler?

A. Yes, sir.

Q. Do you state definitely that none of the costs of the functions listed under legal, administrative, engineering and
1268 accounting, on pages 43 and 44 were incurred in connection with gas purchased for resale?

A. Gas purchased for resale does not involve any considerable supervisory expense.

Mr. SPRINGER. Will you repeat my question, please?

(The question is repeated.)

The WITNESS. Not to the extent of the amount of the gas purchased for resale, no, sir.

Mr. SPRINGER. I do not believe that answers the question. Will you repeat it again?

(The question is repeated.)

The TRIAL EXAMINER. Now, read the answer.

(The answer is repeated.)

The TRIAL EXAMINER. It is not very clear to me.

Mr. COCKLEY. You mean No, don't you? Is not that the effect of it?

Mr. MILDE. Do you understand the question, Mr. Antonelli?

The WITNESS. Yes, I do. Maybe the incidental costs in connection with the purchase of gas has been included, but to include the amount paid for gas purchased would greatly distort the overhead percentage.

By Mr. SPRINGER:

Q. How do you know that?

A. It is self-evident.

1269 Q. Will you explain that to me?

A. Because the gas purchased for resale is a very large amount of money, and the Company would make a contract and that contract would be in effect year after year and certainly it would distort the picture if we added this gas purchased for resale year after year in order to determine the overheads. The overheads would be out of line.

The TRIAL EXAMINER. Your question was whether these overheads had been added to the gas purchased, was it not?

Mr. MILDE. In replying to the Examiner, let me ask if you did not add overheads to the gas purchased? Did you?

The WITNESS. No; we did not.

The TRIAL EXAMINER. That is the way I understood the original question. The question was whether or not any of these items had been included in gas purchased.

The WITNESS. The gas purchased was eliminated from the operating expenses when the overheads were determined.

By Mr. SPRINGER:

Q. Do you know how much of the costs of the functions of the administrative, legal, accounting and engineering departments are related to gas purchased for resale?

A. Not offhand; no, sir.

Q. You mentioned the contracts and the functions of the legal department relating to gas purchases for resale, and you
1270 exclude in your computations the gas purchased for resale?

A. Yes, I do.

Q. Are you able to state definitely that none of the costs of the functions listed under the administrative and accounting departments are incurred in connection with your second exclusion, gas used for compressor station operation, on page 44?

A. Yes, sir.

* * *

Q. Can you state that none of the costs of the functions you have listed under administrative and accounting departments, are incurred in connection with your third exclusion, depreciation and amortization items and taxes, other than payroll taxes?

A. Item Number 3 has been excluded because depreciation and amortization do not involve actual expenditures. Taxes do not involve supervision in proportion to the amount of the tax paid.

Q. Your answer would be "No." to my question, would it not?

A. That is right.

Q. Can you state that none of the costs of the administrative, accounting and engineering departments, are incurred in
1271 connection with your fifth exclusion, which is three-quarters of the cost of large purchases of property in place?

A. That is approximately right; yes, sir.

Q. You mean the answer is, No?

A. The answer is, No.

* * *

1325 Q. Now, will you please refer to page 13 of your Exhibit 20. Were the actual administrative and general expenses formerly charged to operating expenses by the Hope Company?

A. Yes, Sir; they were.

Q. Did the Hope Company ever maintain any records by which it could equitably allocate administrative and general expenses to specific construction projects?

A. No, sir.

Q. Have representations ever been made for the Hope Company in a rate proceeding where its administrative and general expenses reflected on the books had been reduced to exclude amounts now claimed to be allocable to construction costs?

A. May I have that question repeated?

1326 (The question is repeated)

The Witness. I personally don't know of any.

* * *

By Mr. Springer:

Q. In your exhibit on original cost, you have restated approximating a net of $17,000,000, which were formerly charged to operating expenses, from 1900 to 1939, isn't that so, Mr. Antonelli?

A. That is correct.

Q. Mr. Antonelli, referring to page 13 of your exhibit, how did you determine that interest during construction should be 6 per cent?

A. We had to have a reasonable interest rate which could be used over a long period of years, and after consideration, we decided to use the West Virginia legal rate for interest for all items in the original cost exceeding $5,000. in cost and requiring more than thirty days to construct.

Q. Whe nyou say "we decided" would you name the per-

1327 sons in the conference?

A. The decision was made by the management of the Company, Mr. Chisler and Mr. Tonkin, I believe—I am not quite sure if he was present—and the counsel for the Hope Company——

* * *

The Witness. A more appropriate interest during construction would have been the fair rate of return applicable to the properties throughout the history of the Company. However, it would have been very difficult to determine such a rate year after year, and that was one of the reasons that we finally

1328 adopted the 6 per cent legal rate, which we think is a reasonable rate.

By Mr. SPRINGER:

Q. Has the Hope Natural Gas Company ever paid 6 per cent on borowed nioney?

A. They have loaned money out at 6 per cent.

* * *

Q. Do you know whether the Hope Company has ever borrowed any money for construction purposes?

A. I don't know offhand, no, sir; but I made an investigation and I found out that the Company has loaned money at
1329 6 per cent.

Q. What has been the Company's experience in borrowing money? Has it ever paid 6 per cent for borrowed money for construction purposes?

Mr. COCKLEY. I still object to the question.

The TRIAL EXAMINER. The objection is overruled.

Mr. COCKLEY. Exception.

The WITNESS. I must repeat my answer that I don't know.

By Mr. SPRINGER:

Q. You don't know?

A. No, sir.

Q. You made no investigation of the cost of money to the Hope Company?

A. No, sir; I did not.

Q. Please refer to page 31 of your exhibit. Apparently overheads for compressor station equipment have been duplicated in that statement. Would you explain that?

A. What overheads?

Q. Engineering and superintendence, for example?

A. No, they have not been duplicated.

Q. Does not the book cost already include overheads for engineering and superintendence?

A. It includes a small amount of engineering and superintendence. They call it engineering and superintendence,
1330 but usually it means surveyors or engineers making locations and expenses for some of the general officers.

Q. And the engineering and superintendence in your overheads which has been added includes those same services, does it not?

A. It is no duplication at all.

Q. Why?

A. There is an additional general overhead which is administrative, accounting, engineering, and legal.

Q. How do you know that it is not a duplication?

A. I know because I investigated it. I had pages to show station by station, who did the station and how it was built and what was included and what was excluded. As a matter of fact I did not include all of the costs. I have a statement that will show even by names, the men that have been excluded. We have pro-rated all overheads on an equal dollar basis. It was taken as to each item of equipment and there was no duplication whatsoever in the overheads.

Q. Now, referring to page 31 again, you have a classification of property there, property purchased from non-utilities or other utlities, where not an operating unit or system. Who determined what purchased property was to go into this classification?

A. A list was prepared of all of the companies from
1331 which we purchased properties, and that list was turned over to the legal department of the Hope Natural Gas Company, and the legal department spent a considerable time in going over the annual reports filed with the West Virginia Public Service Commission, and also by writing to the various companies.

Q. And you relied on that determination for your classification?

A. Yes, sir.

* * *

Q. Do you know what the basis of the classification was, or did you just take the legal department's determination?

A. Most of it is self-evident. The companies are such, when they are serving the public, and when there were a few doubtful, and it was gone through very carefully, and we carried
1332 on correspondence for several months before we finally decided whether or not the Company was a utility.

Q. Will you state the amount of property purchased from non utilities or from other utilities, where not an operating unit or system, as reflected in your exhibit, and which represents what percentage of the total of such property, plus the property constructed by the Hope Company?

A. I have an approximate figure which shows the properties acquired from non-utility companies. It is only an approximate figure. It amounts to approximately $1,800,000 which is less than 7 per cent of the total original cost.

Q. It would be a greater precentage, would it not, of the total of the property plus property constructed by the Hope Company?

A. This $4,800,000, the 7 per cent represents the percentage of the total property—of the $70,000,000.

Q. Yes; but the percentage of $64,917,000 of property purchased from non-utilities, or from other utilities where not an operating unit or system, plus the property constructed by the Hope Company, would be greater, would it not?

A. Yes, sir.

Q. Do you have that percentage?

A. No, I have not. It would be about 7½ per cent.

* * * *

1334 Q. Do you know the amount of property that was purchased by the Hope Company from associated companies?

A. No, sir; but it is in my papers, in my working papers.

Q. Could you furnish that?

A. That would be a very big job, because we have our properties set up by units of property, and it would necessitate going over all of the working papers.

Q. Do you remember whether there was much property purchased from associated companies by the Hope Company?

A. They purchased properties from the Clarksburg Light & Heat Company, the Mountain State Company, the Flaggy Meadow Company, some perhaps from the Reserve Gas Company, the Hope Construction and Refining Company, the South Penn Oil Company—those are the major companies, I think.

Q. Those are associated companies, from which the Hope Company has purchased property?

A. Yes, sir.

Q. Do you know the dollar amount?

A. Not offhand; no, sir. How much the company paid for the properties, or the original cost?

1335 Q. Stated in original cost.

A. No; it is all intermingled in our work sheets, with other properties, and it will be a big job to get it.

Q. It might be $9,000,000 might it not?

A. The total purchased properties from utilities and nonutilities amounted to $9,000,000 but I know that the Company has purchased properties from other companies which are not affiliated or related to the Hope Company, so it could not be $9,000,000; it must be less.

Q. Do your working papers show the original cost to the former companies of the properties purchased by the Hope Company?

A. It shows the properties as they existed on December 31, 1938—the remaining properties as of December 31, 1938.

Q. Mr. Antonelli, is the amount of properties purchased by the Hope Company from associated companies readily ascertainable from your working papers?

A. I don't know what you mean by "readily ascertainable."

Q. Is it set out? Is it segregated or is it intermingled?

A. The development of the cost is segregated, but in a summary in the final work sheets it is intermingled, because, for instance, the Company might buy a well from the Reserve Gas Company and drill it deeper, and therefore, half of the well is Hope
1336 Company and drilled by the Hope Company, and the other half was purchased from the Reserve Gas Company, so in order to give you a statement of the amount, as you would like to have it, it would be necessary for me to go to the working papers.

Q. Did you not first make an analysis of purchases by the Hope Company?

A. Yes, sir; I did.

Q. Then you must have a list of purchases by companies and the amounts, and then the associated companies could be selected from that list?

A. But this is not an easy job. We have been working here now for a long time and we have 78,000 sheets, you know. We tried to do a job which could be substantiated, and it is not just sitting down and taking figures and going to this book and getting the cost of a prior company and then going to another book; it is not done that way. We had to investigate it and investigate the vouchers, and investigate the records, and we had to make certain adjustments, and we had to apply costs that were not shown on the books, so I could not just go there and give you a figure in five minutes or a half a day. It will take time. We have all the information—we have everything.

Q. That information is available?

A. Yes, sir; it is available.

1337 Q. But it would require a compilation of material?

A. The property purchased from affiliates and still in existence—information of that kind is available, yes, sir.

Q. You said that you made an analysis of the property purchased by the Hope Company?

A. Yes, I did; a very detailed analysis.

Q. And that would show the total property purchased by the Hope Company from associated companies, would it not?

A. As they existed on December 31, 1938.

Q. Can you furnish that information?

A. It will require a little time. Of course, I will have to ask my counsel.

Mr. MILDE. I don't understand what Mr. Springer wants.

Mr. SPRINGER. It is pretty obvious that when the Hope Company buys property from an associated company, it is important to investigate the price paid and the original cost to the company first dedicating it to the public service, in order to determine whether or not there is an inter-company profit.

* * *

1338 Q. In estimating the general and administrative expenses allocable to cost of this type of purchased property, did you distinguish between properties purchased from associated companies and from nonassociated companies?

A. Are you referring to properties purchased from utilities or from nonutilities?

Q. From nonutilities.

A. On properties purchased from nonutilities, the overheads that we added was equivalent to one-quarter of the general overheads which we applied to the property purchased from utilities, and that one-quarter of the general overhead was the same for the property purchased from affiliated companies or property—no: it could not be—yes: it is possible. Excuse me. From
1339 affiliated companies, or nonaffiliated companies, or nonutility.

Q. How did you determine that it should be one-quarter for overheads estimated to be allocable to property constructed by the Hope Company?

A. I discussed this matter with the management of the Company, and with counsel, and they all came to an agreement that the time of the Company's supervisory forces which was spent in negotiating and purchasing such properties, was about a quarter of the time that they spent in constructing new properties, and it was decided to use a quarter of the general overhead.

Q. Were any studies made upon which the one-quarter determination was based, or did you just get a statement?

A. In connection with another company, I had occasion to make a study of this type, and from our engineering experience with such properties, we think, and I think myself, that one-quarter is a fair figure—that one-quarter of the general overhead is a fair figure for properties purchased from nonutilities.

Q. What other company were you speaking about?

A. With a company that was purchased from—I don't know offhand; I will have to refer to the working papers.

Q. You will look that up?

A. Yes.

1340 Q. When you spoke of the management and counsel, could you name the persons who advised you to use the one-quarter estimate?

A. Mr. Chisler and Mr. Tonkin and counsel for the Company.

Q. Now, referring to property purchased by Hope from utilities, as an operating unit or system on page 32, totalling $3,218,399.28 in column 12, captioned, "Cost Capitalized per Hope books," what does that represent?

A. That represents what the Hope Company paid for these properties, exclusive of any additional charges that might have been incurred. That is the actual price that they paid.

Q. That is the cost to the Hope Company at the date of their acquisition?

A. For the properties still in existence at December 31, 1938.

Q. What disposition was made of the costs subsequently retired?

A. I could not answer that question.

Q. You know how much the Hope Company paid for the property but you don't know how much has been retired since it was acquired?

A. No; because I was not interested in how much property had been retired. I worked from the inventory as of

1341 December 31, 1938, the total properties existing as of that date.

Q. Do you know what the cost capitalized per the predecessor company books was in relation to the $3,000,000 figure of cost capitalized per the Hope Company books?

A. We might have some of those figures on our working papers, but I am sure that we do not have it for all of the companies.

Q. Do you know what the original cost of the property was when it was first devoted to public use by the predecessor company?

A. No, sir; I was not interested to know.

Mr. COCKLEY. Are you speaking now of nonutility companies?

Mr. SPRINGER. No; we are speaking of property purchased by

the Hope Company from other utilities, as an operating unit or system.

Mr. MILDE. What was your question?

By Mr. SPRINGER:

Q. Do you know what was the original cost of the property to the predecessor company first devoting it to the public use?

A. No, sir; although there might be some papers in my files which will give you some information, but I am certain that the information is not complete.

The TRIAL EXAMINER. You said that you were not interested in that question?

1342

The WITNESS. No; because I was interested in the properties existing December 31, 1938, and I did determine the original cost of properties which are still in existence but not the properties that were retired or withdrawn.

Mr. COCKLEY: I do not think the witness and the Examiner are talking about the same thing, but maybe I am the one that is confused.

By Mr. SPRINGER:

Q. Referring to page 32, Mr. Antonelli, under the caption "Property purchased by Hope from other utilities as an operating unit or system," you show in column 12 the figure of $3,218,399 cost capitalized per the Hope Company books?

A. That is right.

Q. Did you determine the original cost of that property to the predecessor company first devoting it to public use?

A. Certainly; yes, sir.

Q. You did?

A. Yes, sir.

Q. And where is the difference between the original cost and the amount that Hope paid for that property?

A. That would be shown in the details of our working papers.

Q. Under the new Uniform System of Accounts for West

1343

Virginia gas utilities, that would appear in the acquisition adjustment account, would it not?

A. This is not an accounting job. I was just determining the original cost of these properties.

Q. Of course, you constantly refer to the West Virginia Public Service Commission Uniform System of Accounts in your exhibit. You say you have adopted the accounting principles?

A. Yes, sir.

Q. And you have used their classifications of property. Did you just take what you desired from the system and ignore the rest?

A. No. This original cost has been set up on the same basis as if this uniform system of accounts had been in effect throughout the history of the Company.

Q. Does your exhibit contain the amount which you say you determined to be the original cost of the property to the predecessor company first devoting it to public use?

A. Yes, sir; if you will refer to the property purchased by the Hope Company from other utilities and operating systems or units; yes, sir.

Q. Well, is that in your exhibit?

A. That is in various items of equipment purchased. You will find it in the well accounts, building of pipe lines, and it is all set up, and we will estimate what the company
1344 paid and what was original cost.

Q. Don't you have a tabulation that will show in one column the original cost of the property to the company first devoting it to public use, and in the next column the amount of money paid by the Hope Company for that property, and another column showing the difference?

A. No, sir. We had a job to prepare this original cost, and we had a big job and we could not stop and make different kinds of exhibits, exhibits that I did not think were necessary at the time.

* * *

1346 The WITNESS. Column 12 gives you the cost capitalized on the Hope Company's books, and that shows what the Company actually paid for these properties.

The TRIAL EXAMINER. But it does not show what the company originally devoting it to public use paid for it, does it?

The WITNESS. Column 11 will give you that for——

Mr. MILDE. (Interrupting). Column 17.

The WITNESS. Column 17 will give you that.

The TRIAL EXAMINER. Column 17 represents the total of columns 12, 13, 14, 15, and 16.

The WITNESS. That is the original cost to the prior companies.

* * *

1348 Q. On page 32, Mr. Antonelli, with respect to direct material and labor costs, to other utilities, which were purchased as operating units in the amount of $4,639,000 how did you secure that information?

A. The information came from records pertaining to the prior companies, and in some cases where the records were not available, direct material and labor costs were estimated.

Q. Do you know how much of the amount was charged to operating expenses on the books of the predecessor company?

1349 A. In most of the cases, the companies were affiliated or associated with the Hope Company and were under the same management, and the books were kept about the same as the Hope Company's, and I had an idea—I knew that the affiliated companies kept their books as the Hope Company did.

Q. How much of the amount did you have to estimate?

A. I could not tell you offhand.

Q. Pardon me?

A. I could not tell you offhand. I don't know.

Q. Was it a large amount?

A. I don't think so; no.

Q. I believe you have stated that the direct material and labor costs were charged to operating expenses by the predecessor companies?

A. Direct material and labor costs? No; I did not.

Q. Didn't you say the practices were the same as the Hope system?

A. Yes sir. The books were kept exactly as the Hope keeps their own books.

Q. How did you determine the actual material and labor cost for other utilities?

A. By analyzing the vouchers, as in the case of the Clarksburg Heating and Light Company. In the case of the Mountain

1350 State, I think we had quite many records. We had some records in connection with the Flaggy Meadow Company.

Q. On page 16, you state that where the original costs could not be ascertained from the predecessor company's books, that Hope Company's experience was used as the basis. Did you make an appraisal for that purpose?

A. An appraisal? No, we did not make any appraisals at all. We determined the original cost.

Q. If you had to use the Hope Company's experience you had to determine comparability, didn't you?

A. Certainly. For instance, the Clarksburg Light & Heat Company has a well in the Bridgeport District and the Hope Company has a well in the Bridgeport District, and if we have

the cost of drilling a well, say in 1916, for that district, certainly that would be a fair price to use for pricing the Clarksburg Light & Heat Company's well. It is not an estimate or making a unit cost, but it is basing it on the best available information that we could get.

Q. On page 34, under column 14, unloading, hauling and warehouse handling cost on property purchased by the Hope Company as operating units, totalling $18,556, were they formerly charged to operating expenses?

A. I don't know. These overheads were based on the Hope Company's experience. It does not amount to very much in dollars.

1351 Q. You did not make an examination of the predecessor company's books to determine that cost?

A. No; it would have involved a great deal of work and it was not worth it. I don't believe we would have been able to get all of the costs.

Q. You don't know whether they were expensed or capitalized?

A. No, sir.

Q. On page 32, referring to——

A. (Interrupting.) I would like to correct that statement. I know they were not capitalized and they were not included under direct material and labor costs. I know that much.

Q. Under indirect field costs, column 15 of page 32 of property purchased by the Hope Company from other utilities, as operating units totalling $38,919 were those costs determined from the records of predecessor companies?

A. No, sir; they were based on the Hope Company's experience.

Q. That was the basis of the memory of the men who were field superintendents?

A. Yes, sir.

Q. Were actual indirect field costs of property purchased by the Hope Company as operating units, charged to operating expenses by the predecessor companies?

A. I don't understand your question.

1352 Mr. SPRINGER. I will ask the reporter to repeat the question.

(The question is repeated.)

The WITNESS. It all depends on the kind of properties involved. In some cases, some kinds of properties, the predecessor, judging from the method that the Hope Company kept their books, the

indirect field costs were charged direct to investment. In other cases, such as gas well equipment and field lines, my judgment on what I saw on the Company's books was that they were charged to operating expenses.

Q. Were any of those indirect field costs capitalized by the predecessor company?

A. As I said, for certain of the accounts, yes, sir.

Q. Do you know how much?

A. No, sir; that was reflected in the costs which we obtained from the predecessor company, but I don't know how much.

Q. Now, referring to the overhead costs, column 16, page 32, totalling $122,042, how do you know that the overhead percentages for the Hope Company constructed properties apply to the purchased properties?

A. That was based on my experience in the last twenty years. The Hope Company overheads were very reasonable, and
1353 I considered that it would be applicable to properties that were purchased from other utilities, as part of a unit or system.

Q. Were the actual overhead costs for property purchased by Hope as operating units, charged to operating expenses by the predecessor companies?

A. Yes, sir; as far as I can determine from the company's predecessor books.

Q. Throughout your examination, you have stated that you consulted Mr. Chisler or received instructions from him in the preparation of your exhibit.

* * *

The WITNESS. Yes; I consulted Mr. Chisler and consulted some of the other men of the Hope Company management, and I consulted the counsel of the Company.

* * *

5068 Cross-examination by Mr. SLAFF:

Q. Did you follow a Code of Accounts in the preparation of your original cost determination in this case?

A. Yes, sir; I did, as much as possible.

Q. What Code of Accounts?

A. I followed the West Virginia new Code of Accounts as prescribed in 1939.

Q. And the Federal Power Commission System of Accounts?

A. That is practically the same, those two.

Q. Now under those Codes of Accounts or Systems of Accounts similar to those two, what original cost determinations have you made other than the Hope determination?

A. Peoples Natural Gas Company.

Q. And those are the only two that you have made under
5069 those types of systems of accounts?

A. That is right.

Q. And you say with respect to the Peoples determination, Mr. Radcliffe, the Treasurer of the Company, was in charge of that, in general charge?

A. Yes; he was the man that decided on certain policies that we had to follow.

Q. Tell me this, Mr. Antonelli: Do you consider a coat of paint a property?

A. A coat of paint?

Q. Yes.

A. Why, certainly, if the house was painted when the building was first built, sure, why not?

Q. I am not asking you, Mr. Antonelli, to ask me why not. You do, then, consider a coat of paint a property of the Hope Natural Gas Company?

A. Yes, because I wanted to determine the complete original costs of the property. We went out in the field and found this building ——

* * *

5070 Q. (Interposing.) What building? Have I inquired about any building, Mr. Antonelli?

A. You said coat of paint as part of some other item.

Q. I am asking you whether you consider a coat of paint, just that, a property of the Hope Natural Gas Company. Now will you tell me whether you do or do not consider that a property?

A. I couldn't answer that question.

Q. You can't?

A. No, sir.

Q. Why didn't you say so in the first place?

A. All right.

Q. You cannot answer, then?

Mr. MILDE. He has already answered.

Mr. SLAFF. Now he has changed his answer.

By Mr. SLAFF:

Q. You cannot answer as to whether or not you consider a coat of paint a property of the Hope Natural Gas Company, is
5071 that correct?

A. If it is part of some other item, yes; it is a property, and I tried to explain why.

* * *

5072 By Mr. SLAFF:

Q. Now, Mr. Antonelli, let's see if we can start over again in the light of the instructions—and the only binding ones are those of the Examiner.

In the light of those, can you now tell me whether you consider a coat of paint a property of the Hope Natural Gas Company?

A. I could not answer this question without qualification.

Q. And do you consider freight costs a property of the Hope Natural Gas Company?

A. Absolutely; yes.

Q. Now with respect to our coat of paint, or your coat of paint, you said you couldn't answer whether you considered that a property of the Hope Natural Gas Company without a
5073 qualification, is that right?

A. Yes, sir.

Q. Do you want to answer that with a qualification now?

A. Yes, sir; I do.

Q. Will you go ahead and do that?

A. All right. When we made the inventories of the Hope properties, we found that certain buildings were painted. Then by going to the Company records we found the cost of the buildings and found the material and the labor, but the voucher disclosed that the cost of painting was not included in this particular voucher for the particular building that I have reference to. Therefore, we added to the cost of the building the cost of the paint, and in that case we considered the painting as a cost of the property just as much as the lumber or anything else that went into that particular building.

Q. No, I didn't ask you whether you considered the cost of the painting as a cost of the property, that was not the question, Mr. Antonelli. The question was whether you considered the coat of paint a property of the Hope Natural Gas Company?

A. Yes, sir, with the qualification that I made.

Q. You do?

A. Yes.

Q. Now will you turn to page 72, say, of your exhibit
5074 that has been marked No. 60.

Now with respect to the office and warehouse, No. 9001, is it a fact that no costs were included in the Federal Power Commission original cost exhibit for that warehouse and office?

A. No, sir; that is not the fact.

Q. For that warehouse and office, costs were included in the Federal Power Commission original cost exhibit, is that not so?

A. Well, certain costs were included, but not all of the costs were included.

Q. Well, it is not an accurate statement to say, is it, that no costs were included in the Federal Power Commission original cost exhibit for office and warehouse, No. 9001?

A. No, but that is qualified by saying——

Q. (Interposing). Just a minute——

Mr. MILDE. (Interposing.) Let him finish his answer.

Mr. SLAFF. We will get his qualifications. Let's take it step by step.

By Mr. SLAFF:

Q. That statement, as I gave it to you, is not an accurate statement, then: that is to say—let me repeat it again.

TRIAL EXAMINER. I assume that you are making the statement, you are not referring to a statement that he has made elsewhere?

5075 Mr. SLAFF. I will come back to the statement that he has made.

By Mr. SLAFF:

Q. It is not an accurate statement to say that no costs are included in the Federal Power Commission original cost exhibit for the Hope Natural Gas Company, Office and Warehouse No. 9001, in the Bridgeport District, is it?

A. Well, as far as you have gone you are correct. Of course, in my testimony yesterday, I said that part of the costs were not included. That was, I believe, the answer to the first question asked.

Q. Now also with respect to the Drilling Tool Shed, No. 9003, the original cost exhibit of the Federal Power Commission does include costs for that Drilling Tool Shed, does it not?

A. Well, it includes incomplete costs.

Q. Well, it does include costs for that Tool Shed, does it not?

A. Yes, it does.

Q. All right——

A. (Interposing.) Certain costs.

Q. Again with respect to that Drilling Tool Shed, No 9003, in the Bridgeport District, it is inaccurate to say that there are no costs included for that Drilling Tool Shed in the Federal Power Commission original cost exhibit?

A. I didn't say that.

5076 Q. Isn't that correct?

A. No, sir.

Mr. MILDE. I object to that question, because nobody has made that statement except Mr. Slaff.

Mr. SLAFF. No one except the exhibit on its face, that is all.

Mr. MILDE. The statement is not made in the exhibit, and we are not cross-examining Mr. Antonelli about the correctness or incorrectness of statements made by Mr. Slaff. It is perfectly apparent that when it says Office and Warehouse, No. 9001, and lists items of property that are excluded, that you can't take part of the description and say—is that an accurate or inaccurate statement?

TRIAL EXAMINER. It also says there, "All material and construction costs"; what does that mean?

Mr. MILDE. For this concrete block wall, et cetera, as contained in Office and Warehouse No. 9001.

Mr. SLAFF. It is thoroughly patent to me, Mr. Examiner, that this is a completely misleading exhibit beginning with column 1, and I think I have a right to develop that.

TRIAL EXAMINER. Well, the way I would read this, the way I would interpret it would be that it included all of the Office and Warehouse No. 9001, and these items set out under that are simply specifications of what might have gone into it. I cer-

5077 tainly would not conclude that it only meant a portion of that office and warehouse.

Mr. MILDE. Well, I think if Mr. Antonelli hasn't made that clear already, he should, because it is those parts of these buildings for which all construction and material costs are excluded.

Mr. SLAFF. It seems perfectly patent that it hasn't been made too clear up to now. If the Examiner understands it as he stated, and as I understood it until I started to get into the

underlying work papers and found that the original cost exhibit of the Federal Power Commission did include costs for many of the items set out in column 1.

TRIAL EXAMINER. As I understand it now, then, the first line in each of these items represents the structure concerned, and then below that you set out in more detail the items which were not included, is that it?

Mr. MILDE. That is right. Take that first item. Now Office and Warehouse No. 9001, the following parts of that building, as it were, were not included in the Commission examiners costs, but were included by Mr. Antonelli, the concrete block wall, plasterboard, millwork, plumbing fixtures and electric lights, and the exclusion there is all material and construction costs for those parts of the building. Now if you will run down to, say, the Dresser Coupling Shed, No. 9056, which is the second item under the Buffalo District, there the amount excluded is the
5078 building itself, you see "One story, wood frame structure, with rolled roofing and wood sheathing sides". That means that in that case the entire building was excluded. Frankly, it was difficult to set these matters up, but we did it in a way that we thought would give as nearly a complete story as we could, and you really have to read each one of these subsidiary items to know what part of the cost of a building, whether it was all or part, has been included by Mr. Antonelli and excluded by the Commission examiners.

Take the bottom line of this page, Screw Coupling Shed, No. 9058, and there the description is a description of the entire building, "One story, wood frame structure", and so on, whereas, if you go up to the Oil House, No. 9002, the second item, the omitted parts there are the millwork, electric lights, and so on.

Is that a correct statement, Mr. Antonelli, of the way this item is set up?

The WITNESS. That is entirely correct, that is exactly what we did.

TRIAL EXAMINER. It seems to me that under this arrangement here, you would have set up, under this first item, the entire original cost of this structure as shown in Exhibit No. 20. That would appear in column No. 1, or No. 2, rather, and then over here you would have shown the amount included by the F. P. C. original cost exhibit and the amount excluded, and
5079 explain the amounts which were excluded.

Mr. MILDE. Well, that would have meant practically a reproduction of these 70,000 work sheets that we have.

TRIAL EXAMINER. Well, it doesn't seem to me that it would. Of course, I don't know as we are accomplishing anything by arguing about it, but if you put this concrete block wall, and so forth, over in the last column, that would have made it clearer.

Mr. MILDE. That might have been a better way to set it up. You don't always think of the best ideas first. I want the Examiner, however, to be perfectly clear what this exhibit shows on those structural items; those parts or all of the structures that have been omitted are described under the name of the structure. I think the only exception to that, that I should direct your attention to, is in the case of the lease and land accounts——

Mr. SLAFF. (Interposing.) We will come to that. I would like to proceed.

TRIAL EXAMINER. Proceed.

By Mr. SLAFF:

Q. Do you agree, Mr. Antonelli, with Mr. Milde's testimony?

A. Yes, sir; I do.

Q. Now with respect to the items on page 72, then, as he explained it, taking the Tool Shed listed in the Buffalo
5080 District, one story, wood frame structure, et cetera, that indicates that no costs were allowed for in the Federal Power Commission exhibit, is that right?

A. No; there is another item, 9056 seems to be a complete building.

Q. I am just taking them one by one.

A. Oh.

Q. Now with respect to No. 9055, because there is that description, we are to understand that no costs were allowed in the Federal Power Commission exhibit of that building, is that right?

A. That is right.

Q. The same is true with respect to 9056, is that correct?

A. Yes.

Q. 9057 also?

A. Yes, sir.

Q. Go over to 9060 on page 73. That is described as a one story, wood frame structure with rolled roofing, et cetera. Were any costs included in the Federal Power Commission original cost exhibit for that item?

A. No, sir.

Q. None whatever?

A. No, sir.

Q. Where is that listed in your working papers?

5081 A. It is listed on page 12, book 137.

Q. Is it not a fact that $325.51 of the cost of that storage shed was included in the Federal Power Commission original cost exhibit?

A. I can't say offhand unless I refer to my papers.

Q. You just said offhand a minute ago that no cost was included, didn't you?

A. Yes, sir; I did, according to this.

Q. Now what do you say on reconsideration?

A. I don't know what is in the papers.

Q. Go to your working papers.

A. I haven't got those working papers with me. I will produce the working papers and check it up.

Q. Will you check that up?

A. Yes, sir.

Q. Tell us if that is not a fact with respect to storage shed No. 9060.

A. 9060 or 9059?

Q. 9060.

A. I don't think there is anything included in the Federal Power Commission exhibit for this particular shed; but I would like to check it.

Q. By all means.

A. I will.

Q. Now let's go to the leases.

5082 From pages 4 to 30 in your Account No. 330-2, Natural Gas Producing Leaseholds, Operated, how many leases do you show on those 26 or 27 pages?

A. I haven't counted them.

Q. Well, I total about 2,650; does that sound about right to you?

A. Well, I will check it up. Yes, that is about right.

Q. Now you show, do you not, obtaining costs for each one of those leases?

A. No, sir.

Q. As excluded in the Federal Power Commission original cost exhibit?

A. No, sir; I don't.

Q. Well, what do the words "Obtaining cost" mean in line 1 of page 4, column 7?

A. As I testified yesterday, I said either obtaining or recording or abstracting, and an occasional consideration.

Q. With respect to Lease No. 578, did you include, as shown on page 4, obtaining costs?

A. No, sir; in that case I included $17.20 for abstracting cost. That is all that is included in that particular lease.

Q. What about lease 1897?

A. 1897?

Q. Yes.

5083 A. I don't have that lease, but I can look it up.

Q. What about 3977?

A. On 3977, I have costs of obtaining of $8; and I have costs of abstracting of $17.20; and costs of recording—$1.35.

Q. And for that lease 3977, you have no consideration?

A. Well, the consideration was capitalized, it wasn't necessary to include the consideration here.

Q. Then the consideration was not excluded in the Federal Power Commission original cost exhibit with respect to lease 3977, was it?

A. No; I never said it was.

Q. Well, your exhibit shows it as excluded in the Federal Power Commission original cost exhibit, does it not?

A. Well, this is only a brief description——

Q. (Interposing.) You mean a brief misleading description?

A. No; it would have been a tremendous typing job to list every cost separate, Mr. Slaff.

Q. Well, it is a tremendous job, Mr. Antonelli, I want you to understand, for me to have to go through this with you and make it understandable and correct.

A. I went over it with Mr. Pace. He came down to Clarksburg and we spent two days with him, and he examined the books, and it was perfectly clear to him that these were only part costs.

5084 Q. Mr. Antonelli, did you tell us in your direct testimony that the consideration cost of Lease No. 3977 had been included in the Federal Power Commission original cost exhibit?

A. Yes, sir; a general statement was made to that effect.

Q. With respect to Lease No. 3977, which, as far as your Exhibit 60, page 4, indicates, the consideration therefor was excluded in the Federal Power Commission cost exhibit.

Now, with respect to that specific lease, did you tell us, anyplace in your direct-examination, that the consideration cost for

that lease was included in the Federal Power Commission original cost exhibit?

A. Well, nobody asked me. No; I didn't.

Q. Well, were you holding out because nobody asked you?

A. Oh, no.

Q. Well, did you go over your testimony in advance with your counsel?

A. Yes.

Q. You knew what he was going to ask you?

A. Sure.

Q. And you knew in advance, before you got on the stand, didn't you, that you were not going to tell us with respect to any of these specific leases here, which your exhibit shows costs to have been excluded in the Federal Power Commission original cost exhibit, that those costs were not excluded?

5085 A. Well, as a matter of fact, I did, now when I come to think of it. I gave you the total amount for this cost to be $49,000, of which only $15 was consideration. Therefore, anyone, I assume, would understand that it cost more than $15 to purchase or to acquire these leases. I did say that; I did say that yesterday.

Q. And it is on the basis of that answer that you—in your mind, at least—justify stating that consideration costs for various of these leases are shown to be excluded in the Federal Power Commission exhibit, is that right?

A. Not only on that statement. I explained this exhibit to Mr. Pace, and I also made a statement yesterday which showed that the omitted costs were only part costs or the direct material and labor costs that were not capitalized on the Company's records.

Q. Now you show recording costs as excluded in the Federal Power Commission exhibit for each and every one of these 2600 or more leases, do you not, in your Exhibit No. 60?

A. No, sir; I don't.

Q. Well, do you show in line 1 of page 4 that recording costs for the three leases there shown were excluded in the Federal Power Commission original cost exhibit?

A. Not in this exhibit, it is shown on page 21.

Q. Turning to page 4——

A. (Interposing.) Yes, I have page 4.

5086 Q. Does that show that the recording costs for the three leases in the first line were excluded in the Federal Power Commission cost exhibit?

A. No, sir; it doesn't.
Q. It does not?
A. Not on this page; no, sir.
Q. Well, now, are you looking at column 7?
A. I am looking at column 7.
Q. What is the heading?
A. It says, "Obtaining, recording"——
Q. (Interposing.) No, the very top heading.
A. "Excluded in F. P. C. Original Cost Exhibit."
Q. That it right.
Now that means, I take it, excluded in Federal Power Commission original cost exhibit, is that right?
A. That is right.
Q. And underneath that heading are set out the items which were excluded in the Federal Power Commission original cost exhibit, is that not correct?
A. Yes, sir; that is correct.
Q. All right. Now with respect to the three leases in the first line on page 4, according to column 7 of your Exhibit 60, page 4, recording costs for those three leases were excluded in the Federal Power Commission original cost exhibit, isn't that so?
A. That is correct, but——
5087 Q. (Interposing.) Just a minute, we will get to your explanation.
Mr. MILDE. Let him finish now.
Mr. SLAFF. I have no objection to his making an explanation. But I would like to have him make it in an orderly fashion at the right time.
Mr. MILDE. This is the point that he has selected to make that explanation.
TRIAL EXAMINER. You want to strike out your original statement, "That is correct"?
The WITNESS. No, I would like to qualify my statement, Mr. Examiner.
TRIAL EXAMINER. You don't mean, then, that it is correct; you mean it is correct with qualification?
The WITNESS. That is right.
I would like to say that yesterday I explained that the costs excluded by the Federal Power Commission were either obtaining or recording or abstracting and an occasional consideration.
I was very particular about that, and the only reason that we did it this way was to save time and save a typing job. Other-

wise, we would have had about 10,000 pages here in this report. That is the only reason we did it the way we did.

By Mr. SLAFF:

5088 Q. Are you all through with your qualification?

A. Yes, sir.

Q. Do you want to make any more? Feel free to if you want to.

A. No; that is all.

Q. Now we have got your answer complete, then?

A. Yes, sir; you have.

Q. Now then, to get back to the original question.

As far as the face of this exhibit is concerned, page 4 of Exhibit 60, your represented in the exhibit that with respect to the three leases shown in the first line, the recording costs were excluded in the Federal Power Commission cost exhibit, isn't that correct, Mr. Antonelli? Isn't that a fair statement?

A. Well, not the way I look at it.

Q. Looking at the face of the exhibit? Look at that for a while, will you, and tell me if that isn't a fair statement that I have made to you?

A. I assume that someone not familiar with these pages might take it that way.

Q. Well, isn't it a fair statement, Mr. Antonelli, that anyone looking at this exhibit, looking at the exhibit itself, would find that you were representing in the exhibit that recording costs for the three leases set out in the first line of that page had been

5089 excluded in the Federal Power Commission original cost exhibit; isn't that a fair statement of what any reasonable person, looking at that exhibit, would understand, Mr. Antonelli?

A. Yes, sir.

Q. And the same is true, Mr. Antonelli, is it not, with respect to all the other leases set out on that page, that is to say, that any reasonable person looking at your exhibit would understand that you were representing that the recording costs for each and every one of the 2,600 leases contained in those pages 4 to 30, had been excluded in the Federal Power Commission original cost exhibit; isn't that so?

Mr. MILDE. Well, now; I object to that, because that isn't pertinent to this case. It isn't a matter of whether any reasonable person——

Mr. SLAFF (interposing.) It is pertinent to the fact that this is the most misleading exhibit, or one of the most misleading, that has been put in by the Company.

Mr. MILDE. May I finish?

TRIAL EXAMINER. Yes, proceed.

Mr. MILDE. This exhibit is part of a great mass of testimony on the matter of costs of leases and other things. It fits into the Company's exhibits and the Commission examiners' exhibits, and it is perfectly apparent, when those are all compared, precisely what is shown here.

Mr. Antonelli read the dollar amounts yesterday. We
5090 are not concerned here whether somebody to whom we handed this exhibit, on the street, even if he was a reasonable man would have any idea what it was about, he probably wouldn't. But fitting into the picture with all these other exhibits that are in here, which show that the Commission examiners have allowed so much for operated leases, and Mr. Antonelli claims so much, and there is a difference, his explanation as to what the dollar amounts are included in these things yesterday, it is all perfectly clear in the record and there was not the slightest attempt on the part of the Company to misrepresent the situation.

Now unfortunately, on some of these exhibits you don't always get them into the precise technical shape you would like, and I am sure Mr. Slaff wasn't misled, and we got this exhibit up in a hurry for cross-examination, and if we were doing it again we probably wouldn't do all this ditto marking, and that is why I had Mr. Antonelli explain yesterday that in the case of these leases, with respect to various leases, sometimes it was the recording cost and occasionally the consideration cost, and the abstracting cost and occasionally the obtaining cost, and he read the dollar amount of each of those in the record, and that was for the purpose of trying to make clear that we didn't intend by this exhibit to represent—and the Commission's staff knows that—we didn't intend to represent, in the case of each and every one of
5091 these leases, that all of these costs were excluded.

I think Mr. Slaff is right in saying that if you just presented it to somebody who just read the English language, without knowing anything about this case, he might get a wrong impression, and I had hoped yesterday that Mr. Antonelli had cleared that up.

In the case of leases and land accounts, some costs, of course, have been included by the Federal Power Commission exhibit, that is shown by this exhibit, it is shown by the comparison exhibits that are in this case; it is shown by our exhibits.

And this inventory of omitted items is intended to show the character of the excluded costs, and I don't want the Examiner

to think that we intended to make anything but a perfectly frank statement as to what this was, and I hoped that it had been clarified yesterday when I had Mr. Antonelli tell what the dollar amounts were.

My objection is based on the ground that to ask Mr. Antonelli whether a reasonable man would look at this and draw certain conclusions, just isn't pertinent to this case.

If he wants to ask whether he thinks somebody who knows all about these other exhibits would be misled, that might be pertinent.

Mr. SLAFF. As matter of fact, Mr. Examiner, this exhibit is thoroughly misleading, and it wasn't until last night,
5092 when I started trying to reconcile parts of his testimony with this exhibit, that I become aware first of the fact that apparently all these costs set out as excluded were not as had been represented in the exhibit. Up until that time—and I made, I think, a reasonably careful check of the exhibit—I had taken it for granted that they were as represented here.

Mr. MILDE. Well, I think, that is perfectly understandable, because Mr. Slaff hasn't been in this case from the beginning, and he doesn't know what these other exhibits are. I think if he were coming into it fresh, he might well have the viewpoint of the man on the street, and not——

Mr. SLAFF. (Interposing.) Let's get the viewpoint of the man who purports to be a little familiar with the case.

TRIAL EXAMINER. Objection overruled.

Mr. SLAFF. Can we have the question, Mr. Reporter?

(The question was read by the reporter as follows: "Q. And the same is true, Mr. Antonelli, is it not, with respect to all the other leases set out on that page, that is to say, that any reasonable person looking at your exhibit would understand that you were representing that the recording costs for each and every one of the 2,600 leases contained in those pages 4 to 30, had been excluded in the Federal Power Commission original cost exhibit; isn't that so?")

The WITNESS. It is a little misleading. I will admit that.

5093 By Mr. SLAFF:

Q. And the same is true also with respect to Account 330–2, "Natural Gas Producing Leaseholds—Unoperated," as set out at pages 32 to 62?

A. Yes, sir; that is correct.

Q. Now with respect to these 2,600 leases, or thereabouts, set out at pages 4 to 30, for which you show obtaining costs for all of them, there were obtaining costs attached to only about how many, do you know?

A. The obtaining costs were attached only to the leases that were purchased from landowners, I can't say how many.

Q. About 300, wouldn't it be, instead of the 2,600 for which you show obtaining costs?

A. Well, I will tell you how many.

Q. How much did you use for the average obtaining cost?

A. $8.

Q. $2,400 was your total for obtaining costs?

A. That is about correct; yes.

Q. Now what was the average recording cost, approximately, do you know?

A. The average recording cost I would say amounted to maybe $1.50 or maybe $2, I can't tell—probably there were 400 recordings.

Q. Instead of the 2,600 for which recording costs are shown as excluded by the Federal Power Commission exhibit,
5094 original cost exhibit, there are only 400, approximately?

A. That is right.

TRIAL EXAMINER. What was the total amount of that cost?

MR. SLAFF. $704.

The WITNESS. That is for operated leases.

By Mr. SLAFF:

Q. And, of course, with respect to all those numberless leases for which you shown consideration costs, probably only a very, very few of those actually had any consideration costs which were excluded in the Federal Power Commission original cost exhibit; that is also correct, is it not?

A. I think there was only one lease, I am not quite sure.

Q. Well, if there was only one lease, Mr. Antonelli, or only two leases, that had any consideration cost excluded by the Federal Power Commission exhibit, why did you show consideration costs excluded by them for every one?

A. Well, this was only a general heading, Mr. Slaff, and I probably should have made it a little clearer. I agree now with you that it is not as clear as it should have been.

Q. Let's go a little further into that. You show a consideration cost for all the leases set out on pages 4 to 11 of your exhibit, don't you?

A. 4 to 11?

Q. Yes.

5095. A. Yes, sir.

Q. Then at pages 11 to 20, you drop consideration costs as having been excluded in the Federal Power Commission original cost exhibit, isn't that so?

A. No; that must have been a mistake in typing, that is the first time I noticed that it was dropped; or maybe there wasn't any consideration for those particular leases. I will have to check that.

Q. Well, we know there wasn't any consideration for those?

A. Yes.

Q. And we know that there wasn't any consideration for all but two of the rest of the 2600, isn't that so?

A. I will have to check that statement. Maybe a consideration did appear to the extent of maybe a dollar per lease.

Q. If it was a dollar per lease, there couldn't have been any more than 15, could there?

A. I will have to check that.

Q. Let's have an answer right now. The total consideration cost of these leases was $15, wasn't it?

A. That is right.

Q. Now considering a dollar lease, that means that the consideration cost, excluded as you claim by the Federal Power
5096 Commission exhibit, applied to only 15 of the leases at a maximum, isn't that so?

A. No; it may be 50 cents.

Q. Well, we will get to the 50-cent basis. At a dollar a lease consideration——

A. (Interposing.) That will affect 15 pages.

Q. 15 pages or 15 leases?

A. 15 pages, because maybe each lease might be on a separate page.

Q. Now, let's start all over again, Mr. Antonelli, so you understand my question.

Let's begin from the beginning. You told us there were $15 of consideration costs excluded by the Federal Power Commission's original cost exhibit, is that right?

A. Yes, sir.

Q. Now you don't want to change that statement, do you?

A. No, sir; I don't.

Q. Now you told us a little earlier this morning that maybe that applied to a couple of leases, one or two leases, and you apparently do want to change that statement now, is that correct?

A. Yes; I am not quite sure now when I see all the consideration appearing on certain pages and not on other pages. I would like to change my answer.

Q. Do you know of a consideration for a lease of 50 cents in the Appalachian field?

5097 A. No; well, I can't say offhand.

Q. Do you know of any?

A. Yes, I think so. They get some for nothing.

Q. But did you ever hear of a consideration of a half a dollar being offered?

A. Oh, yes; sure. I think you will find some in our working papers.

Q. And a quarter.

A. Yes, and 5 cents.

Q. You did?

A. Yes.

Q. Do you have any distinct recollection, or are you just plucking things out of thin air?

A. No; I am talking from records. I am pretty certain that I found some 5-cent considerations.

Q. Now of course you testified that they got some leases for nothing?

A. There are some leases included in here that the Company paid just obtaining and abstracting and recording costs on.

Q. Now, getting back to your consideration of $15, you have no idea whatever of how many leases that applies to?

A. Not offhand; no, sir.

Q. Do you have any judgment?

A. No; there are too many leases, I can't guess it.

5098 Q. You mean that on that one thing you won't guess, is that right?

A. Not until I look at my papers, and then I will tell you the right answer.

Q. Now can you tell us why, after setting out, on pages 4 through 11, consideration costs as excluded in the Federal Power Commission original cost exhibit for all the leases up to the last five lines of page 11, you, from that point on, through the 15th line on page 20, did not show consideration costs as excluded? What occasioned the change?

A. Well, I can't answer that question offhand. I will look it up at noontime and look up the working papers, and I will be glad to answer the question, because anything I say now will be a guess.

It was done in a hurry, it might be that it was just a mistake, but I don't think it was a mistake. The other reason might be that the boys were certain that there was no consideration for those leases listed in this particular book, which is Book 22, and so they left that out. I am very certain that it was done on purpose, because, as you will notice, that is in Book 22.

Q. Yes; and it occurs in the middle of a page, and one thing or another?

A. Yes; there possibly wasn't any cost of consideration shown in this particular book, and therefore the boys left out the word "consideration."

5099. Q. Now then, will you check that and find out the reason for it?

A. Yes, sir.

TRIAL EXAMINER. As I understand your explanation, these are not general statements over here in column 7, but are applicable to actual situations, is that correct?

The WITNESS. No; they are general statements, but apparently Book 22—and by "Book 22" I mean the Original Cost 22, where all those costs are set up in separate columns—did not show any consideration expensed.

TRIAL EXAMINER. And those in book 21 do show consideration expense?

The WITNESS. Yes.

Mr. MILDE. That is for one or two leases?

The WITNESS. That is right, that is apparently what has happened.

TRIAL EXAMINER. The difference, then, is with respect to one or two leases?

The WITNESS. Yes; we are just talking about $15 now.

By MR. SLAFF:

Q. Was the rest of this exhibit prepared with the same care, Mr. Antonelli, as went into the preparation of that part of the exhibit that deals with Account No. 330-2?

A. Well, the rest of the exhibit shows definitely what the items are. This was the only one that we had a general
5100 statement on, on account of the large typing job.

Q. That isn't the question. The question I put to you is: Did the people who prepared this exhibit, and you in supervising the preparation of the exhibit, devote any more care to that portion of the exhibit that deals with other accounts, than you did to that portion of the exhibit that deals with Account 330-2?

Mr. Milde. I object.

Trial Examiner. The objection is overruled.

The Witness. I would say that the whole exhibit was prepared with great care. We didn't try to do one account better than the other account, and it was all prepared with great care.

By Mr. Slaff:

Q. I mean, whether it was prepared with great care or not is perhaps something that someone else other than you and I will judge, but at least it was all prepared, in your judgment, with the same degree of care throughout?

A. Yes; there wasn't much to do but record these costs from the original cost books. There wasn't any trick involved in summarizing these books.

Q. Of course, whether or not there was a trick involved is also another question?

A. Well, there wasn't.

Q. Then, as I understand your answer, and I don't know
5101 whether you answered my question, but as I understand it you didn't put any special care on one part of the exhibit as against another, it was all prepared in the same general way?

A. That is right.

Q. Now will you turn for a minute to page 356. You show there, do you not, in the first four items, expenses in connection with Line H-2?

A. Yes, sir.

Q. When was that line laid?

A. The line was laid in 1902.

Q. When was the first amount shown in column 2, of $219.60, spent by the Hope Company?

A. In December 1902.

Q. And what is the voucher reference on that?

A. M-225, 1902. The amount is $15.07.

Q. Now is the total of $219.60 made up of several items?

A. Yes, sir.

Q. All expended in December of 1902?

A. No, sir; the first one was in connection with freight and it happened to be in December 1902. The amount was $15.07.

Q. All right, when was the next?

A. The next one was——

Q. (Interposing.) And by the way, to what account was that amount charged?

A. Well, it was charged to expense, I don't know the
5102 account.

Q. It was charged to an operating expense account number?

A. It wasn't capitalized, it was charged to expense.

Q. Just a minute, Mr. Antonelli. Was it charged to an operating expense account?

A. I think it was; yes. I don't know, but I am certain it was; I would have to check it.

Q. Well, will you check it and tell us to what operating expense account that amount was charged?

A. Yes, sir.

Q. Now when was the next item going into that total of $219.60?

A. The other item pertains to a labor expense and has a voucher number H–126, 1902, for $4.34, probably in August.

Q. Of what year?

A. They are all 1902.

Q. Tell me this: Were all of these items going into the total of $219.60 charged to operating expense accounts?

A. I think they were; yes.

Q. Now going to your item of $18,323.64, when was that incurred?

A. Well, I think that was incurred in 1905 or 1906, I am not exactly sure of the date, but it was two or three years after the line was laid.

Q. And what was the nature of the work in connection
5103 with which that expense was incurred?

A. Well, that was in connection with clamping this 18-inch line going to Cleveland.

Q. And to what account or accounts were the expenses that went to make the total of $18,000, charged?

A. I think they were charged to operating expense. I will have to look that up this noontime, and I will let you know.

Q. That is made up, is it not, of a great number of vouchers for small amounts?

A. No; I think that is only one voucher, but I will check it.

Q. Will you check that?

A. Yes.

Q. And will you also check the specific accounts so that you can tell us the specific accounts to which the expenditures were charged?

A. Yes.

Q. Now going to the next item on that page, 639 feet of 18-inch pipe of line H–2, when was the expense in connection with that incurred?

A. Well, I can't say that offhand, I will look it up. I can't remember all of these things, and I don't have my details here.

Q. All right, check that, please.

5104 Will you also check the item of $9,673.62?

A. I can tell you something about that.

Q. All right.

A. The $9,673.62 represents the cost of laying an additional river crossing.

Q. When?

A. I am sorry, I will have to look that up. I haven't got the information here.

Q. And you will tell us when, and also what accounts the items were charged to?

A. Yes, sir.

Q. Now going to page 357, and taking the largest item on that page, Clamps on pipe line H–2, the next to the last item, that shows an expenditure of $15,638.63, does it not?

A. Yes, sir.

Q. When was that expenditure made, do you know?

A. It was made, I would say, two or three years after the line was built.

Q. Made about 1906, wasn't it?

A. Somewhere around there, 1905 or 1906.

Q. And do you know whether or not that was charged to Account No. 2, repairs to lines?

A. No, I don't, but I will be glad to check it.

Q. You will verify it?

A. Yes.

* * *

5107 PETER ANTONELLI resumed the stand and testified further as follows:

Cross-examination (resumed) by Mr. SLAF:

Q. Now, Mr. Antonelli, in respect to the items we have been discussing on pages 357 and 356, are there specific vouchers in back of each of the expenditures there shown?

A. There are specific vouchers for the amount of approximately $58,000 out of $103,000 not included in the Federal Power Commission Exhibit 57.

Q. Are those specific vouchers for material costs or for construction costs, or for both?

A. They are for both. $15,638.63 is for equipment costs, and the rest of it, I believe, is mostly for constructing river crossings and replacing river crossings, and so on.

Q. How much did you say was for material costs?

A. $15,638.63.

Q. With respect to the difference between the amount for which you found specific vouchers, and the $100,566 total
5108 shown on page 358, how did you determine that difference?

A. This difference represents construction costs for extensions of the lines listed on these two pages, namely, 356 and 357. The material for these extensions was capitalized, and we didn't have any trouble in finding it, and found out what date they were installed, and so on——

Q. (Interposing.) If I may break in without interrupting your train of thought, you say you had no trouble finding the material costs. Did you have specific vouchers for that?

A. Yes, sir; we did.

Q. Well, let's start all over again, then.

Tell me first off, out of this total of $100,566.82, for how much did you have specific vouchers?

A. Well, approximately $58,000, and about $45,000 we did not have vouchers for.

I was looking at page 357.

Q. All right, $102,962, right?

A. Yes.

Q. And for $58,000 you have specific vouchers?

A. That is right.

Q. That leaves?

A. $44,000.

Q. For which you have no specific vouchers?

A. Yes.

Q. Now with respect to that $44,000, how did you
5109 determine the amounts which went into that total?

A. That is just what I was trying to explain before you interrupted me.

Q. Well, the explanation didn't seem to me very clear.

A. I have to give this kind of an explanation.

By going to the capital account for the main lines, we found that the Company has capitalized the extensions of these lines that are shown at pages 356 and 357. This list repesents mostly exten-

sions of initial installations, and as I said, the material was capitalized and recorded on the Company's books.

However, the labor for construction of these lines was not capitalized; only the initial installation of the lines was capitalized. By that I mean that when the line was laid, they capitalized both the material and labor; but with additions they, as a rule capitalized only the material.

Therefore, there was no way for me to find the actual construction costs of this extension. Therefore, it was necessary for me to estimate these costs, and they were estimated, based on known costs for similar lines in about the same period.

In other words, we summarized all of the costs of 10-inch pipe—transmission line I refer to now—and found out that for a certain period the cost might have been, say, 90 cents a foot, and
5110 we applied that 90 cents a foot against the 10-inch extension lines that were shown in here. That gave us a result which was very conservative, because, as everybody knows, extensions cost more money than the initial installation, but that was the best we could do, so we used this conservative estimate.

Q. Did you add anything to the known labor costs?

A. No, sir; I just used them as I found them on the Company's records.

Q. Did you add 25 percent to the known labor costs in this connection, or in any other connection, in your exhibit?

A. I don't know what you mean by 25 percent overhead cost; I didn't add anything but the costs as I found them on the Company's records.

Q. Did you increase your labor costs, as found in the Company's records, by 25 percent in any case in the preparation of your estimates?

A. Well, I don't understand your question—which estimates?

Q. The ones that you are referring to now and those that were made in connection with Exhibit 60.

A. Are you referring to Account 353?

Q. I am referring now to any of the estimates made in Exhibit No. 60.

A. I thought you were talking about Account 353.

Q. Well, I am asking you a general question now.

5111 A. Well, I haven't added any overheads.

Q. I didn't ask you whether you had added any overheads. I asked you whether you had increased the cost of labor, as determined from your analysis of the company's records, by 25

percent in any of the labor estimates that you made in connection with the items shown in Exhibit No. 60?

A. No, sir.

Q. You did not?

A. No, sir; I haven't added any 25 percent to the Company's records, no, sir.

Q. All right, let's leave page 357 for a moment—we will come back to that—and let's turn to page 72 of your exhibit.

Have you that before you?

A. Yes, sir.

Q. The first item there is Office and Warehouse, No. 9001, Concrete block wall, et cetera—is that right?

A. Yes, sir.

Q. And an amount is shown of $442.44, is that right?

A. Yes, sir.

Q. How was that amount derived?

A. In this case of this Office and Warehouse, No. 9001, the incompleted costs for this building (and by "incompleted costs"

5112 I mean that part of these costs were found on the Company's records and capitalized, and the amount shown here was not capitalized and not allowed by the Federal Power Commission), we were unable to find the cost of the concrete block wall, plasterboard and millwork, plumbing fixtures and electric lights in any of the investment structure accounts. Therefore, we estimated in this case the material cost and the construction cost.

Q. And you estimated the material cost——

A. (Interposing.) By using, for the material costs, vouchers for exactly the same kind of materials, maybe the voucher would be exactly for the same materials, but I couldn't identify it; but for the same kind of materials that were expensed. In other words, they weren't capital vouchers.

That gave us the cost of the material.

Now as far as the labor is concerned, we estimated the labor using the performances, the Company's performances. Those performances were again determined by analyzing several compressing station structures where we knew the actual cost of installing or constructing these compressing station structures. We picked those stations because we were certain that the costs were complete.

Now in order to simplify the work, we developed unit costs using just ordinary performances which weren't applicable to this particular Company, but just ordinary performances.

Q. That is from the Company records?

A. No, not yet; I am coming to that.

5113 Now to these performances we applied the actual labor rates that the Company pays, and we got a unit cost. Then we applied those unit costs to the material, the quantity of materials for these stations that we knew the actual cost. Then we totalled them, then we divided this total into the total of the actual costs of the compressing station structure that we did know, and the percentage varied from 20 to 30 percent, or something like that. So we decided to use 25 percent.

In other words, we added 25 percent to this performance we had worked up to equalize them to the performances of the Company, and I think that is what you had in mind.

Q. After analyzing the Company's records and developing unit performances, and developing labor costs per unit, you then added 25 percent on top of that to the labor costs, did you not?

A. No, sir.

Q. Well, let's start again?

A. I didn't say that at all.

Q. You developed the material costs, did you not?

A. Yes, I developed the material costs.

Q. Then you proceeded to analyze the Company's records to determine your labor costs, right?

A. Yes; and I found——

Q. (Interposing.) Just a minute. And from that you

5114 determined the labor performances?

A. No, sir; I didn't; I didn't say that.

Q. Well, did you or did you not?

A. No.

Q. Were your labor costs developed as a ratio of material in any cases?

A. I don't know what you mean by "ratio."

Q. Mr. Antonelli, don't you know what a ratio is?

A. Well, not in this sense, no.

Q. Well, do you know what a ratio is, just a plain ratio?

A. Well, a ratio is a relation between one thing and another.

Q. Then you know what ratio is?

A. Yes.

Q. Did you develop labor costs as a ratio to material costs in any instance?

A. I found, in the case of compressing station installation costs, the relationship between the total construction costs and the total

material costs of the initial installation before retirement, to obtain the relation of labor to material; yes, I did.

Q. Then you did develop a ratio, you did develop labor costs as a ratio of material costs, is that right?

A. Well, not in the sense of the way you are saying it.

5115 I found out what was the relation, say, in a compressing station, between the labor and material. Say the relation was 25 or 30 percent. I used that as a basis in some cases to price certain items; yes.

Q. Now in what cases?

A. That is in the case of compressing station installation costs.

Q. Now what ratios did you develop?

A. Well, they vary according to the station and the year and the type of equipment, and so on. We didn't just take one ratio, we made sure that we got what was right.

Q. Let's confine ourselves for the minute to Office and Warehouse, No. 9001.

Did you determine your labor cost by the application of a ratio to your material costs?

A. No, sir.

Q. You did not?

A. No.

Q. Did you in the case of any item contained in Account No. 331-3?

A. Well, there are so many items, I don't know, but I don't think so. I can't say offhand, but I don't believe so. There might be an item here and there.

Q. Will you bring in Book No. 136 this afternoon?

A. Yes, sir; I will be glad to if it is here.

Q. Well, if it is not here, send for it.

5116 A. All right.

Q. Did you make a study, in connection with this and other items—and I am referring to 9001, Office and Warehouse—of the Company's labor performance, by years and by districts, from the Company's records?

A. I think we did, not in the case of this account, but I believe in the case of the Account for the Measuring and Regulating Structures.

Q. How did you determine the labor performance to estimate the construction cost of this Office and Warehouse, No. 9001, shown on page 72?

A. As I explained it—do you want me to explain it again?

Q. Well, you explain it.

A. We have developed unit costs. That was the basis of it.

Q. Did you develop unit performances for specific types of activity?

A. Yes, sir; we did.

Q. And was that from the Company's records?

A. No, sir.

Q. Now what was that from?

A. That was a general engineering performance, the general engineering performances that we use for estimating purposes——

5117 Q. (Interposing.) Well, weren't you developing Hope Company's costs and not general costs?

A. Yes; but you didn't let me finish. I was going to tell you what we did after that.

Q. Go ahead.

A. We got these general performances and we did that just as a matter of convenience. There were so many small items of this type, and we had to finish the job, the Company was pressing me for time, and I had to do something about it.

So that is why we used these general performances.

To these general performances, which was just hours, we applied the Hope Company's labor rates.

Q. Where did you get those labor rates?

A. Those labor rates came from the Company's payroll vouchers and the Company's records, the genuine labor rates paid by the Company. That is the second step.

After that we applied this performance—now we have complete performance, cost per foot for laying brick, or what not—we applied these performances to three stations for which we actually knew the installation costs, and we knew the quantity of material that went into these stations. Of course, that was as of the date when the station was built. We totalled it, and say that this station came to a certain amount of dollars for installation. That was on one hand.

On the other hand, we had the total cost for installation 5118 of these stations that I referred to. Now, dividing one by the other we found out that these general performances were 25 percent, on the average, higher than what the Company's performances were.

Therefore, we increased the cost 25 percent. That was done as a matter of saving time. I could have done it the other way and avoided all these arguments now.

Q. Well, after developing general performances, units of performance, to which you applied the Hope Company labor rates, you then increased the total dollars thus derived by 25 percent, is that correct?

A. That is in the instances that I used the estimate.

Q. For example, in connection with the Office and Warehouse, No. 9001, you developed, did you not, a material cost of $270.04, and then a labor cost, on your general performances, of $172.40, which latter amount you then increased by 25 percent, which gave you a total of $442.44; that is correct, is it not?

A. I don't know the amount, but we did substantially that in order to get the performances of the Company.

Q. And that was in line with your conservative policy, is that correct?

A. Absolutely; yes.

Q. Now while we are on that subject, will you tell us where in the System of Accounts of the West Virginia Commis-
5119 sion or the Federal Power Commission, you find authority for making such estimates in determining the original cost of a natural gas company's property?

A. Well, I——

Q. (Interposing.) Constructed by you?

A. I find it in the definition of original cost.

Q. Which one is that?

A. That is shown on page 5.

TRIAL EXAMINER. That is the West Virginia Code?

The WITNESS. It is both West Virginia and the Federal Power Commission.

Mr. SLAFF. Page 5 of the West Virginia System of Accounts. The definitions are the same?

The WITNESS. Yes.

It says: "Original cost as applied to gas plant means the cost of such property to the person first devoting it to public service."

By Mr. SLAFF:

Q. What does definition 10 say?

A. "Cost means the amount of money actually paid for property or services or the cash value at the time of the transaction of any consideration other than money."

Q. Where is there any specific authorization in the System of Accounts for making estimates?

5120 A. Well, there is at some place here. It is at some place on pages 48 and 49, it is a long time since I have looked at this book.

Q. Do you mean Account Instruction 2 (C)?

A. On page 38 it says, "Original cost under gas plant purchased"——

Q. (Interposing.) I am speaking now of original cost of plant constructed by the company.

A. Well, in order to get——

Q. (Interposing.) As long as you understand, go ahead and answer.

A. The only way to get the original cost is to get the full cost of the property, and if the full cost was not reported in the Company's books, we had to estimate it. I thought that was in accordance with the definition of original cost.

Q. Well, I asked you, Mr. Antonelli, whether you found any specific authorization for estimating the original cost of plant constructed by the utility, in the Uniform System of Accounts?

* * *

5125 "Q. Well, I asked you, Mr. Antonelli, whether you found any specific authorization for estimating the origi-
5126 nal cost of plant constructed by the utility, in the Uniform System of Accounts?"

The WITNESS. You refer to property constructed by the Company?

By Mr. SLAFF:

Q. That is right.

A. I can't recall offhand. There might be something in the books, but I can't recall offhand as to property constructed by the Company, but it was evident that if I was attempting to get the complete costs of the property, and the amount of money the Company actually paid for this property, I had to do just what I did, and determine the full cost of these properties. There are no two ways about it, and that was my problem, to get the actual amount, the amount that the Company actually spent for these properties; and if I couldn't find the cost for certain negligible items, I estimated, and made my estimates based on Company costs.

Q. Well, it is a fact, is it not, Mr. Antonelli, that to the best of your knowledge there is no specific authorization in the System of Accounts for the estimating of costs of property constructed by the utility?

A. I don't know, I don't recall; I will have to refresh my memory about that.

Q. Will you do that and tell us?

5127 A. Yes.

Q. And it is a fact that as far as you know at this time, it is only with respect to the determination of original cost of property acquired as an operating unit or system that the estimating of such costs is permitted by the Uniform System of Accounts of the West Virginia Commission or of the Federal Power Commission, isn't that correct?

A. I don't know, I can't answer that question. I know that practically every company in the country making an original cost study, and not having the actual cost of the property constructed by the company, is using the same method I am using, and they had to estimate it, there is no other way to get it if it isn't on the books.

Q. In respect to this last answer of yours, do you mean that practically every utility company in the country, or most of them, that are making original cost studies, are following methods similar to yours?

A. They are trying to follow methods similar to ours, but some of those companies haven't got——

Q. (Interposing.) Which ones?

A. I can't mention companies; I don't know.

Q. Well, but you just told me that practically all of them were trying to follow the same methods that you have followed. Now would you please name five of those?

A. Well, I could not name five of those.

5128 Q. Can you name three?

A. No; I wouldn't like to mention any names.

Q. Don't be modest or reticent, Mr. Antonelli, this is a public record.

A. I do know——

Mr. MILDE (interposing.) That is just the point.

By Mr. SLAFF:

Q. It is a matter of public information, they all have to be filed with the Commission.

A. I know that they don't have the information.

Q. How do you know if you haven't investigated?
A. That is what they told me.
Q. Who told you?
A. Various men working on the jobs.
Q. What jobs?
A. Various jobs, original cost jobs.
Q. What original cost jobs?
A. Well, I am sorry, but I can't disclose names.
Q. Is it a confidential matter?
A. No; I am just giving you examples.
Q. Well, you haven't given us any examples, Mr. Antonelli, and I am asking you to name five of these original cost jobs that are being done where the same methods that you have used are being followed?
A. I said they were trying to follow.
5129 Q. That is right, where they are attempting to follow the same methods?
A. The Manufacturers Light & Heat Company is trying to follow the same methods, as far as I know now. It is hearsay evidence, because that is what they tell me they do. And the South Penn Oil, I think, is doing the same thing.
Q. Who else?
A. I thought some of the Philadelphia boys, the Philadelphia company.
Q. Is that the Pittsburgh Company?
A. Yes.
Q. Any others?
A. Well, I can't recall offhand.
Q. Are any of those jobs being done by Ford, Bacon & Davis?
A. No, sir.
Q. Now who told you, with respect to the Manufacturers job, that they were following generally the same methods that you followed?
A. Nobody told me, but I was down there examining some of the Company's records in regard to another matter, and I saw they were doing practically or approximately the same kind of work.
Q. And those three companies that you have named are all you can name at this time, is that right?
5130 A. Yes, sir.
Q. All right.
Now then, let's get back to the System of Accounts——

TRIAL EXAMINER (interposing). But you learned they were doing it this way before or after you did this job?

The WITNESS. Oh, after, way after. I mean, what they were doing is that they were analyzing vouchers and making unit costs, determining unit costs based on vouchers, and there was considerable estimating done because they didn't have the records. I have been to those companies in connection with other work, and I know they don't have records, and there is no way to get it from the company's records, except to estimate it.

By Mr. SLAFF:

Q. Mr. Antonelli, hasn't the Hope Company, ever since it has been under the regulation of the West Virginia Commission, been required to keep its books on the basis of cost?

A. I don't know, I can't tell you.

Q. Mr. Antonelli, do you mean to tell us you didn't investigate that before you began your original cost—call it determination?

A. It wasn't necessary. What I did was that I prepared an accurate inventory of the Company's properties; then I went to the Company's records, I didn't care what kind of records
5131 they were, I was trying to find the actual cost of each item, how much the Company paid for these items. We wrote to the various predecessor companies and got the costs from them, and so on. I didn't care how the Company kept it on their books or what they were doing, that wasn't my job, I had a lot of other things to worry about.

Q. Let's see, you worried about the present System of Accounts, because you made your original cost study, as you tell us, in accordance with that System of Accounts, is that right?

A. I followed the general accounting principles set forth in this Code of Accounts, yes. I used the same account numbers and tried to classify the properties in the same order.

Q. What distinction are you making between following the System of Accounts and following the same accounting principles as are set out in the System of Accounts?

A. Well, as I tried to tell you, I set up the properties, classified the properties in accordance with the investment accounts shown in this book, and then followed the principles as to material and labor and overheads.

It states here that you should include with the material, the labor, include its proportionate overhead and construction costs, and so on. I did all of that.

Q. Then you did follow, in making your original cost determination, the System of Accounts prescribed by the
5132 West Virginia Commission and prescribed by the Federal Power Commission, is that correct?

A. Yes, and also I followed the definition of original cost which says that the original cost is the full cost of the property.

Q. Well, let's see if I understand you. You didn't pick and choose out of the System of Accounts as to what you were to follow and what you were to disregard, is that correct?

A. Well, what I did——

Q. (Interposing.) No, Mr. Antonelli——

Mr. MILDE (interposing). Let him explain.

By Mr. SLAFF:

Q. Let me repeat my question, and you tell me whether you can answer it yes or no. Did you pick and choose out of the System of Accounts, certain parts thereof that you would follow, and certain parts that you would disregard?

A. No, sir.

Q. Now let's get to the next question.

A. Well, I would like to qualify my answer now.

Q. Go ahead and qualify it if you want to tell us you did pick and choose.

A. What I did, my first purpose was to determine the original cost, the full original cost of these properties.

5133 TRIAL EXAMINER. Regardless of what the System of Accounts said?

The WITNESS. That is right. I was asked to find out, to go to all records and everywhere and get the actual cost of these properties, how much money this company spent for these properties, and how much the predecessors paid for prior utilities. That was my first purpose.

Then I went to this System of Accounts and said—we are going to use this original cost for other purposes, setting up the books, maybe, in another form.

So in order to help, at least utilize part of this work for other purposes, we set it up using this Code of Accounts shown in here, and classified the property in accordance with this Code of Accounts, and included each item of equipment, each proportion of the installation cost and overheads, and so on.

That was all necessary for setting up the continuing property records. So I could kill two birds at the same time.

TRIAL EXAMINER. In other words, you first decided, irrespective of the System of Accounts, how much you wanted to set up, and then you used the System of Accounts so far as practicable in splitting it up and setting it up; is that the effect of your statement?

The WITNESS. Well, in effect, that is correct. My first reason was to get the original cost of these properties.

5134 By Mr. SLAFF:

Q. Then it is a fact, is it, that in your original cost determination, as you ultimately came to it, you did disregard certain of the portions of the Uniform System of Accounts prescribed by the West Virginia and the Federal Power Commissions?

A. Well, I think there is just one paragraph here where it says about not intended to estimate. I didn't pay much attention to that because it just didn't mean anything to me. How could you determine original cost if you couldn't estimate? It just couldn't be done. If you had to get the total original cost, you had to estimate.

Q. In other words, are you referring to Utility Plant Instruction 2 (B) which states that the cost of the utility of its utility plant shall be ascertained by analysis of the utility's records?

A. Yes.

Q. That instruction in the System of Accounts you disregarded; isn't that correct?

A. Where is that?

Q. At page 48 of the West Virginia Code of Accounts and page 37 of the Federal Power Commission Uniform System of Accounts.

A. Yes; that is right.

Mr. SLAFF. Read the question and the answer, will you, Mr. Reporter?

5135 (The record was read by the reporter.)

Mr. MILDE. I wonder if you won't be fair to the witness and tell him whether you mean all of Instruction 2 (B) or one sentence of it, or what?

Mr. SLAFF. Instruction 2 (B). If he wants to qualify it, let him go ahead and qualify it. He is perfectly able at qualifying, as he has demonstrated this morning.

Do you want to qualify your answer, Mr. Antonelli?

The WITNESS. There isn't anything to qualify. I said I determined the original cost of these properties, and I followed.

this Code of Accounts as much as possible, except that I estimated all of the items that I couldn't find in the Company's books or expensed.

* * *

5136 PETER ANTONELLI resumed the stand and testified further as follows:

The WITNESS. Before we start, I would like to make a correction here to your last question.

Mr. SLAFF. Go ahead.

The WITNESS. You asked me if I had disregarded Instruction 2-B in this new code of accounts and I would like to make it clear that the only portion that was disregarded is the last sentence starting with "It is likewise not intended that adjustments shall be made," and so on.

Cross-examination (cont'd) by Mr. SLAFF:

Q. Well, then, you did pick and choose as to what parts of the system of accounts you would follow and what part of this system you would not follow. Is that right?

A. Well, I determined the original cost.

Q. No, no that isn't the question I asked you, Mr. Antonelli. The question I asked you is this: It is a fact, is it not, that you did pick and choose as to what part of the system of accounts you would follow and what part or parts you would disregard?

A. Well, the only part that I disregarded is the
5137 part that I just mentioned.

Q. And that was a deliberate policy of disregarding that portion of the system of accounts. Is that right?

A. Well, if I hadn't done that, I couldn't have determined the original cost correctly.

Q. That is not the question, Mr. Antonelli. The question is this: Your disregard of that portion of the system of accounts was a deliberate policy adopted by you in making your determinations. Isn't that so?

A. Well, I disregarded that part; yes.

Q. Well, then, it was a deliberate policy which you adopted ——

A. It wasn't a policy.

Q. Just a minute. In making your determination was it not?

A. Well, I will say yes, then.

Mr. MILDE. Mr. Slaff, Mr. Antonelli can report on those questions that you asked him to get at noon.

By Mr. SLAFF:

Q. I think we might get that into the record now, if you have the information.

A. Where are the large books?

(Document furnished witness.)

By Mr. SLAFF:

Q. Have you during the noon recess, Mr. Antonelli,
5138 checked certain matters which were discussed this morning and which you now wish to report on? If so, will you go ahead?

A. Yes, I did. Now, in connection with Account 353, Mains, you asked me in reference to the first item pertaining to Line H-2, $219.60. You asked me as to when those charges occurred and what account they were charged to. The charges occurred in 1902 and 1903 and were charged to Account 11 and Account 14.

Q. And what are Accounts 11 and 14?

A. Well, 11 is conduct. It is named "Conducting-Maintenance" and 14 is "Conducting-Telephone."

Q. Did you say "conducting"——

A. (Interposing.) Conducting, c-o-n-d-u-c-t-i-n-g, conducting.

Q. Does that mean operating, maintenance?

A. Yes.

Trial EXAMINER. Those are West Virginia account numbers, are they?

The WITNESS. These are company accounts, that is way back in 1902 and '3.

Mr. MILDE. There weren't any West Virginia account numbers until 1923.

The WITNESS. The next one was in connection with the next item, Line H-2, showing $18,323.64.

5139 Mr. MILDE. What page is that on?

The WITNESS. Page 356.

That charge occurred in 1906 and it was charged to Account No. 2.

By Mr. SLAFF:

Q. And what was that account?

A. Repairs to Line. The next item is in connection with 639 feet of 18-inch pipe in Line H-2 amounting to $1,245.10.

Mr. MILDE. You mean the construction cost?

The WITNESS. The construction cost—I was coming to it—of 639,000 feet of 18-inch pipe.

By Mr. Slaff:

Q. How many feet?

A. Six hundred thirty-nine feet. Of this footage 316 feet were constructed in 1937 and 323 feet in 1938. No cost was found on the company records.

Q. No cost for what was found?

A. For the construction of these 639 feet.

Q. Yes; and to what account?

A. I don't know. I had to estimate it.

Q. I see. That $1,245.10, then, is an estimated cost, not a voucher cost. Is that right?

A. That is correct, yes.

Q. All right.

5140 A. The next amount is in regard to $9,673.62. That is for the construction of river crossing that took place in 1919 and it was charged to Account 21-D and 23-B.

Q. 21-D?

A. And 23-B.

Q. 21-D is maintenance of transmission line equipment. Is that right?

A. Well, it is marked "Dredging."

Q. Well, what does the account cover?

A. As far as I can determine it just says "Dredging."

Q. Well, is it a subaccount of any other account?

A. It is a maintenance account.

Q. Yes. And what about 23-B? What is that?

A. Well, it is called "Labor"; again maintenance, transmission and labor.

Mr. Milde. I thought you said that figure was 1929. Did you read it 1919?

The Witness. Did I say 1919?

Mr. Slaff. You did.

The Witness. I am sorry, it is 1929.

The next item shown on page 357 pertains to the claims on Pipeline H-2 and the amount of $15,638.63. This charge occurred in 1906 and it appears under Account No. 2, "Repairs to Line."

By Mr. Slaff:

5141 Q. I think that covers what you are requested to furnish with respect to Account No. 353, does it not?

A. Yes, sir.

Q. Is there anything else you have to report on now?

A. Yes, sir; in connection with one of the structures that appears at page 73, I think.

Mr. MILDE. What page?

The WITNESS. Page 73. That was in connection with Building 9,060.

By Mr. SLAFF:

Q. That is right.

A. I looked up this building in my original costs and I have this original cost determination book in front of me and the charge to that building was not included in the Federal Power Examiner's Exhibit 57.

Q. May we have your work book that you are looking at now, please?

A. Do you want to see it?

Q. Yes.

(Book furnished Commission's counsel.)

By Mr. SLAFF:

Q. Your work book shows, does it not, for that building, cost capitalized for company's books of $325.51?

A. It shows the amount of $325.51 under the cost capitalized by the company. Now, that particular item is only a inven-
5142 tory item. In other words, it is shown on their inventory voucher M-181-1920, which was a reclassification voucher in 1920 and it does not pertain to this particular building at all, we had to throw it out. We just disregarded this voucher because the cost shown on the books for this item is not the cost of this particular building.

Q. The problem now, Mr. Antonelli, is not whether you disregarded the $325.51, which your book shows as cost capitalized for that storage shed No. 9060, but whether, as you stated this morning, the Federal Power Commission examiners disregarded that amount.

A. Yes; they did because they accepted our adjusted book cost of a structural account and that as you notice there is zero adjustment for that particular building.

Mr. MILDE. You mean adjustment to zero?

The WITNESS. To zero; yes.

By Mr. SLAFF:

Q. On what journal entry did the Federal Power Commission examiners take that $325.51 out?

A. Well, I can't tell that, but I know that the adjusted book cost as shown by the Federal Power Commission is the same as ours. In other words, the $1,800,000 that they allowed us is the same figure as we had.

Q. Now then, did you make any determination with respect to this specific item and the $325.51 which was cost capitalized
5143 on your company's books for that storage shed as to whether or not the Federal Power Commission examiners did exclude that amount?

A. I did not have to make such a determination; no sir.

Q. You mean you arrived at a conclusion, then, that they had excluded that amount without making any specific determination with respect to it. Is that correct?

A. Well, they must have, they accepted by adjustment.

Mr. SLAFF. Will you repeat the question, please?

(Whereupon, the last question was read by the reporter.)

The WITNESS. Yes.

By Mr. SLAFF:

Q. Now, where is the adjustment with respect to this item of $325.51?

A. Whose adjustment?

Q. Did you make any adjustment with respect to it?

A. Oh, I don't understand what you have in mind, what adjustment?

Q. You have stated, have you not, that this $325.51 was excluded by the Federal Power Commission examiners. Is that right?

A. They must have excluded it, if they accepted our adjustments.

Q. Now, was it stated in your working papers as "Cost capitalized per company books"?

5144 A. Will you repeat the question?

Q. Yes; was it stated in your working papers as "Cost capitalized per company's books."

A. Yes, sir.

Q. And do you know whether or not the Federal Power Commission examiners accepted that amount as cost capitalized per company's books?

A. I know that they did not accept that amount as cost capitalized per company's books because they accepted our adjusted book costs as I determined them.

Q. What adjusted book cost of yours did they accept?

A. They accepted the $1,800,000 adjustments made for property constructed by the company or purchased from other utilities.

Q. Were those your inventory adjustments?

A. They were all kinds of adjustments.

Q. And you say included within that adjustment was this amount of $325.51?

A. I assume so; yes.

Q. Well, don't you know?

A. Well, no; I don't know what the Commission——

Q. (Interposing.) Well, is all your testimony as to what they excluded with respect to this item pure assumption?

A. No; it is a fact that they accepted all of our adjustments.

5145 Q. Well now, is this specific item included in that adjustment?

A. Well, I will have to look up the working papers and I will let you know.

Q. All right, look that up, if you please.

A. All right.

Q. Now, do you have any other matters that you wish to report on?

A. That is all I have at the time being.

Q. Now then, returning to the matter of estimates of original cost which you made and particularly with respect to estimates of labor cost, you testified this morning, as I recollect, that you developed certain performance rates. Is that correct?

A. For certain billing of structure accounts.

Q. Yes, now on what basis did you determine those performances?

A. Well, I already explained that this morning.

Q. Well, as I understand your explanation, it was some kind of engineers' estimates of performance. I am trying to get the specific basis for those performances.

A. Will you explain the question a little clearer, please? I don't understand it.

Q. Surely. I will be glad to. You say you developed cer-

5146 tain rates of performance for different kinds of work. That is correct?

A. Yes.

Q. Now, what I am trying to get from you is from what underlying data you developed those rates of performance. Was a study

made of other companies, studies made of performances at other times, and so on?

A. Well, there are so many questions in the question you ask me. What do you mean by "rates," first?

Q. Well, all right. Let's take any specific item for which you developed performance rates. Did you develop performance rates in connection with the work, the construction work shown on page 72? Let us go back to that.

A. Yes, sir; I did.

Q. You did. All right. Now, for what items, with respect to the first item shown under the "Office and Warehouse, No. 9001," did you develop performance records?

A. I developed performance rates for the portion pertaining to the construction cost of the items that were not allowed by the Commission in connection with this office and warehouse building.

Q. All right, let's see if we can get that a little more specific on the record. Did you develop performance rates for installation of concrete work, a concrete block wall?

A. Yes, sir; I did.

5147 Q. Performance rates for plaster boarding?

A. Yes.

Q. For installing plumbing fixtures?

A. Yes, sir.

Q. And for installing electric lights?

A. Yes, sir.

Q. All right, and similarly for other work you also developed performance records?

A. Yes, sir.

Q. Now that, Mr. Antonelli, is what I mean by performance rates that I have been talking about. Now will you tell us from what underlying data you developed those performance records?

A. The performances as far as the time required to construct these items, I am talking about the hours and so on, were based on information that Ford, Bacon & Davis has in their files. Now, to these performances we apply labor aids which came from the Hope pay rolls named "Pay Roll Vouchers."

Q. Just on the performances?

A. I am not through yet. Now is the part where we deviate. Now, that was the first job that I did. Then I listed the cost of three compressing stations and I was certain that the cost as far as construction cost is concerned was complete.

5148 I also had the quantities of materials that went in this compressing station structure. I applied this performance that I just described to the figures of these three compression station structures and I obtained a total and I divided this total into the total construction cost, actual construction cost, of these stations and I found out that I had to increase these performances that I have just described and cost that I have just described 25 percent together in line with what were the actual performances in cost of Hope Company.

Q. Well now, where did Ford, Bacon & Davis get the underlying data from which you developed your first performance rate?

A. It doesn't make any difference, I could have done it from any——

Q. (Interposing.) It does make a lot of difference, Mr. Antonelli. Now will you tell us where Ford, Bacon & Davis got those performance rates?

A. They got that from their experience. They have all kinds of construction work. It is their own, Ford, Bacon & Davis, experience.

Q. Now what is that supposed to represent? Is that supposed to represent the average construction experience on jobs done or supervised by Ford, Bacon & Davis?

5149 A. No, sir; it is general average perforances used for constructing structures and buildings.

Now that was adjusted upwards or downwards to conform with actual performances to various jobs that we do. In this case we had to adjust it 25 percent to get it to the performance of Hope Natural Gas Company.

Q. Yes; so you have told us several times, but we are not up to the point of adustment yet, Mr. Antonelli. Have no fear, we will come to it.

Now, before we get to that point I want to know from what specific data Ford, Bacon & Davis develops its performance rate.

A. Well, that is from their own experience in connection with other work that they have done, actual construction work they have done.

Q. Then, that is the actual rate of performance on other actual construction work done or supervised by Ford, Bacon & Davis. Is that correct?

A. Yes; large jobs—very large jobs—and it might be in a different part of the country; I don't know. It doesn't apply in that case to the Hope construction.

Q. Well, do you know where or what job, from what jobs those were developed?

A. No, sir; I don't.

Q. I see. Then as far as Hope's construction was con-
5150 cerned, it is piecemeal construction, if you please, that was by way of performance, at least, 25 percent less efficient than the performance that Ford, Bacon & Davis had observed in jobs which it had done or supervised. Is that correct?

A. No.

Q. It is not correct?

A. No, sir.

Q. For the Ford, Bacon & Davis rates were, you told me, developed from actual jobs?

A. Rates, I didn't mention anything about rates.

Q. The performance rates.

A. Oh, excuse me.

Q. The performance rates were developed from actual jobs done or supervised by Ford, Bacon & Davis. Is that correct?

A. Well, they were based on the experience of actual jobs.

Q. Well, when you say they were based on the experience of actual jobs, don't you mean that those were the actual performances on those jobs as determined by Ford, Bacon & Davis?

A. Well, I will explain it. Now, we have in our office a department called "Valuation and Report Department" and we do a great deal of reproduction cost evaluation work, so we try to get our valuation work and the production cost figures
5151 as accurate as possible, as efficient as possible, as easy as possible and as fast as possible, so in the case of buildings, taking into consideration all the experience from our engineering department, we set up formulas for how much we will install in how many hours, say, it will take a bricklayer to lay a thousand bricks. It is set up in such a way that it can be varied up or down on individual jobs and location of the job.

Q. Now, how is it developed, Mr. Antonelli? That is the question which I have asked you and I am still trying to get an answer. Aren't the rates of performance which you have developed in your valuation department based upon actual performance observed by Ford, Bacon & Davis in jobs which it has done or supervised?

A. It is based on the experience of Ford, Bacon & Davis from actual jobs.

Q. All right. Now that experience from actual jobs consisted in recording actual performances in those actual jobs. Is that correct?

A. Many actual jobs, not one, but many actual jobs, yes.

Q. Is that correct?

A. That is correct.

Q. So then, the performance rates, which you have developed in your office files, are then the actual rates of
5152 performance on jobs done or supervised by Ford, Bacon & Davis. Is that not so?

A. No, sir. No, sir; I say thay were based on the experience of Ford, Bacon & Davis, that they got from these actual jobs, but it wasn't based on one job or any particular job.

Q. Mr. Antonelli, I haven't confined any single one of my questions—perhaps you don't understand properly—to any one job done by Ford, Bacon & Davis or to any specific job done or supervised. Now, will you listen carefully to the question, please, and see if you can answer it?

A. All right.

Q. Is it not a fact that the performance rates developed by Ford, Bacon & Davis are the rates of performance found by Ford, Bacon & Davis to exist on many jobs which it has supervised or done?

A. It doesn't apply to any particular job.

TRIAL EXAMINER. Will you read the question again, please?

(Whereupon, the preceding question was read by the reporter.)

The WITNESS. I want to stress that fact.

By Mr. SLAFF:

Q. I think we understand that part, will you read the question?

(Whereupon, the preceding question was read by the
5153 reporter.)

The WITNESS. I will say yes.

By Mr. SLAFF:

Q. All right, those are rates which exist over a wide spread of jobs that your firm has supervised or developed, as I understand?

A. Well, I want to make sure that it doesn't apply to any particular job.

Q. Well, would you call them average performance rates?

A. Average normal rates; yes.

Q. That is the actual, the average normal actual rates of performance that exist, that have been found by you, by your firm, to exist over many jobs? Correct?

A. That is right.

Q. Now, is it not a fact that the performance of the Hope Company, as determined by you, was at least 25 percent less efficient than these average normal actual rates of performance found by Ford, Bacon & Davis to exist in these many other jobs?

A. No, sir. Not efficient. You said efficient. I wouldn't say that. They were less, because of the holding conditions and the type of country and the fact that usually Ford, Bacon & Davis' performances are based on union men, union labor, while
5154 here the company could not get a very good man to properly locate it in remote places and it would be hard to attract real first-class carpenters or bricklayers. That is the main difference that makes the difference of 25 percent in cost. Another thing, this labor is here.

Q. Is what?

A. I mean the non-union labor rates are a little lower.

Q. Are you speaking of the rates of wage now?

A. Yes, wage.

Q. We are not at this time, you understand, discussing wage rates, Mr. Antonelli. We are simply discussing performances.

A. Yes.

Q. Well then, to put it another way, if I withdraw the word "efficient," to do the same work in the Hope Company, it took 25 percent more labor than to do the work for various units as developed by Ford, Bacon & Davis?

A. It took them 25 percent more time, because, as I said, the stations are located in remote places and it takes longer to get there and to come back again. I am not talking about present conditions, I am talking way back in the history of the company, the roads were not so good and it really did take a longer time to construct this building than the performances used by Ford, Bacon & Davis for up-to-date type of construction work.
5155 Now, you say you compared the perfomance rates developed by Ford, Bacon & Davis with the actual rates of performance found in the three buildings of the Hope Company, is that correct?

A. No, sir.

Q. Well, tell us how this comparison of Ford, Bacon & Davis performance was made with company performance to bring about the 25 percent adjustment.

A. Well, I have repeated that four times now, but first of all we applied to those performances the labor aids of Hope as to the day of constructing these three compressing stations, total compressing stations, and priced them, using these performances with the Hope labor aids and we obtained a total. Then we knew the total cost of these stations. I am referring now to structures again.

Now, we divided one by the other. We found that the actual cost was 25 percent higher than using this hypothetical performance.

Q. So from that you deduced that the performance rates developed by Ford, Bacon & Davis were higher by 25 percent than the actual performance rates which had gone into the construction of these three compressor station structures?

A. Not compressing station structures, I am talking about
5156 compressing stations, one at Cornwell, which was a large station, and another was—I will get the names of those stations.

Q. I wish you would, please.

A. Cornwell, Payne and Minnora.

Q. When was Cornwall—is that Cornwell or Cornwall?

A. Cornwell, C-o-r-n-w-e-l-l.

Q. Yes, when was that constructed?

A. I will have to look it up. I think in 1925. I am not quite certain.

Q. What about Payne?

A. Well, I will have to look them up. I don't remember offhand.

Q. Were any of these three stations constructed prior to 1920?

A. I am not certain, I will have to look it up.

Q. Do you have that information here?

A. No; I haven't.

Q. Now then, turning to your Account 353, "Mains," you said with respect to that this morning, if I remember your testimony correctly, that out of a total of some $102,000 summation on page 357, you had specific voucher references for some $58,000 and for $44,000 of construction cost you had no specific voucher references, but had estimated those costs. Is that correct?

5157 A. Yes, sir; that is correct.

Q. Now, those estimates were developed as the cost of similar construction for the same period. Is that it?

A. We summarized the costs of all transmission lines by size and kind by periods for which we knew the actual cost of construction, the actual amount paid by the companay for constructing those lines and we obtained the cost per foot for each size and kind of pipe and that cost per foot was the one that was used in case of the items appearing on pages 356 and 357. It is the actual cost, no estimates at all, the actual cost for constructing similar lines at about the same time and the same kind of pipe.

Q. Well, costs of other construction, of course. That is correct, is it not?

A. The cost of constructing transmission lines; yes.

Q. Not these specific lines?

A. Oh, no; if I had the costs I wouldn't have to estimate it.

Q. Now, Mr. Antonelli, can you tell us which takes more time, abstracting a lease or abstracting a deed?

A. Will you read the question?

(Whereupon, the pending question was read by the reporter.)

The WITNESS. Well, I would say it all depends on the deed
5158 or it all depends on the lease, I can't answer that question offhand.

By Mr. SLAFF:

Q. No; on the average?

A. I don't know, I can't answer that question offhand.

Q. You mean you are just not prepared to answer it. Is that correct?

A. Yes, sir.

Q. All right. Now, turning for a minute to your first account shown in this Exhibit 60, Account No. 330-1, where were the expenses in connection with the items there set out originally charged? Do you know?

A. They were charged to operations.

Q. And beginning right at the beginning with this account you there disregarded the Instruction 2-B of the system of accounts or at least so much of it as states that "It is, likewise, not intended that adjustments shall be made to record in utility plant accounts amounts previously charged to operating expenses in accordance with the uniform system of accounts in effect at the time or in accordance with the discretion of management as exercised under such uniform system of accounts." That is correct, is it not?

A. Yes; I disregarded the last sentence; yes.

Q. Yes. Now, with respect to your Account 330-2, natural
5159 gas-producing leaseholds operated and unoperated, what is the situation with respect to the expenses in connection with those items?

A. Well, what do you mean by "the situation"?

Q. Well, were any items there previously charged to operating expenses or not?

A. I think they were.

Q. Do you know?

A. Well, I know the abstracting cost was charged to operation; yes, sir.

Q. And what about the other costs?

A. I don't know.

Q. What was the answer?

A. I say I can't answer.

Q. Now, with respect to Account No. 330-2, unoperated leaseholds, was any amount allowed by the Federal Power Commission examiners as consideration cost as far as the entire account was concerned?

A. I think that the Federal Power Commission included the unoperated leaseholds in Account 100-4.

Q. Well, was any amount included in that account as representing consideration cost for such unoperated leaseholds?

A. Included where?

Q. By the Federal Power Commission examiners.

A. I know, but where?

5160 Q. As part of the original cost of the property.

A. You mean as part of the $51,000,000 adjusted book cost?

Q. As part of the original cost of that property as determined by the Federal Power Commission examiners.

A. Original cost—I didn't know they had any original cost.

Q. Oh, Mr. Antonelli, quit stalling, will you?

A. No, I am sincere about it. Are you talking about the $51,000,000 or are you talking about the items that were adjusted out?

TRIAL EXAMINER. Whatever we have been talking about all the time.

The WITNESS. No; there are two things in there. We are talking about a $51,000,000 adjusted book cost that we have and they allowed some other items that they adjusted out.

By Mr. SLAFF:

Q. All right, let's get it this way just so you won't have any problems as to what we mean by the question. Did you inventory the leases, unoperated leases?

A. Did I inventory?

Q. Yes.

A. I obtained these lists from the company's records and made sure that they were in existence as of December 31, 1938,
5161 that, in effect, is an inventory of the unoperated leases as of December 31, 1938.

Q. And did you make a detailed list of each and every one of those?

A. Yes, sir; I did.

Q. Now, then, did you make any adjustment to the book cost as shown on the company's books of those leases?

A. We determined the original cost of those leases and, of course, the difference between the book cost and the original cost was the adjustment.

Q. Did you add an amount of $104,811 to the cost shown on the company's books for those leases?

A. Excuse me, I will have to get my papers.

Q. Please do.

Mr. MILDE. Mr. Examiner, on your point, when Mr. Antonelli is talking about the $51,000,000 he means the plant accounts including the operated leases, because the Federal Power Commission examiners in their $51,000,000 figure didn't include unoperated leases but had transferred those to Account 100-4. That may have caused some confusion and I thought I would clarify that.

Mr. SPRINGER. That is plant held for future use?

Mr. MILDE. Yes; and they have treated that another way with some interest.

The WITNESS. Yes; I did. Excuse me, repeat the ques-
5162 tion, please.

(Whereupon, the pending question was read by the reporter.)

The WITNESS. I would like to put it the other way. My original cost was $104,000 over and above the book cost. All right.

By Mr. SLAFF:

Q. That may be a different—I don't know the distinction, but it is all right.

A. Well, I determined the original cost and at the same time my purpose of showing the book cost was to show the relation between original cost and book cost.

Q. Where was that $104,811 determined? How was that determined?

A. That was determined in the same manner as we determined the original cost of the operated leases.

Q. And how was that?

A. By going to the company records and finding the costs of the first lease.

Q. And you had specific vouchers then——

A. (Interposing.) Excuse me.

Q. I beg your pardon, I thought you had completed.

A. The first lease by examining the vouchers and making certain that those were the costs for each lease that we have included in the original cost.

5163 Q. And you found specific vouchers for each and every lease which went in to make up that total of $104,811. Is that correct?

A. Yes, sir.

Q. And that amount was included by Federal Power Commission examiners in their determination of the original cost of gas plant, was it not?

A. It was not included in the adjusted book costs of $51,000,000. It was included as adjustments under Account 100–4, property held for future use.

Q. Well, it is in the total of the gas plant, the original cost of the gas plant as found by the Federal Power Commission examiners, is it not?

A. Not in the $51,000,000 that we are talking about.

Q. The $51,000,000, Mr. Antonelli, refers to the gas plant in service, does it not?

A. That is right.

Q. There is another gas plant of the company, is there not?

A. Yes, sir.

Q. That is gas plant held for future use. Is that not so?

A. That is correct; yes, sir.

Q. So that all the gas plant of the company is composed
5164 generally of two components, gas plant in service and gas plant held for future service. That is correct, is it not?

A. That is correct; yes.

Q. Now, in the total of gas plant, the Federal Power Commission examiners allowed this amount of $104,811 for consideration cost for leases unoperated, did they?

A. Yes, they did and classified it as property held for future use.

Q. And for those considerations you had specific vouchers, did you? Is that correct?

A. Yes, sir; I did.

Q. Did you have specific vouchers for showing the consideration for the other leases unoperated from which you derive a total of $4,088 as consideration cost?

A. Will you read the question.

(Whereupon, the pending question was read by the reporter.)

By Mr. SLAFF:

Q. Let me withdraw that question so it will be a little clearer on the record.

You have stated, have you not, that the total of $71,591 shown on page 62 was made up of abstracting, obtaining, recording, consideration and miscellaneous costs? Is that right?

A. Yes.

5165 Q. And within that total is $4,088 for consideration costs, is that correct?

A. That is correct.

Q. Now then, the question which I put to you earlier, do you have specific voucher references for the consideration costs going in to make up that total of $4,088?

A. No, sir; I do not have specific vouchers for this amount.

Q. Now, to what leases are those dollars applicable?

A. I have the information, but they are not available at the moment. I have them in my working papers.

Q. Now, how did you develop that total of $4,088?

A. It was based on the consideration of other leases acquired from the same county and I believe the same years as the leases, but we did not have the cost, the leases that make this $4,000.

Q. Now, how did you know that consideration was paid for these particular leases?

A. Oh, we have information in the files which shows that consideration was paid.

Q. It didnt' show the consideration, however, is that right?

A. The consideration was expensed and I could not obtain the actual cost so it was necessary to estimate.

5166 Q. Now then, with respect to these leases, you say the consideration was expensed but you have no voucher references for them. Is that right?

A. Yes.

Q. Now, you have a list, do you, of the specific leases?

A. I could produce a list of these specific leases: yes, sir.

Q. To what expense account were those costs charged, do you know?

A. No, sir; I do not.

Q. Well, how do you know they were expenses?

A. As far as I recall, my working papers show that they were expensed.

Q. Do your working papers show the account to which they were expensed?

A. Well, I will have to refer to my working papers to answer that question. I can't tell offhand.

Q. All right, will you do that?

A. Yes, sir.

* * *

5167 By Mr. Slaff:

Q. Now, Mr. Antonelli, I don't know whether we have specifically covered it or not, but the cost which you used for abstracting cost in Account 330–1 was an estimated cost, is that correct? That is at page 2 of your Exhibit 60.

A. The abstracting cost was not an estimated cost, it was based on vouchers and was supported by vouchers.

Q. Well, what vouchers?

A. Hundreds of vouchers.

Q. Well, it was an estimated cost, estimated from hundreds of vouchers for this specific abstracting of Deed No. 46,404?

A. No, sir; I explained yesterday, and I will explain it again, that the Company never kept the cost of each abstracting separately. Therefore, it was necessary for me to total all of the abstracting costs and divide it by the number of abstracts, to get an average cost.

5168 It is an allocated price, an allocated cost, and I did that for various periods, but it was supported by vouchers, and we have the vouchers, and I can tell you the name of the man that did the abstracting, and the date he did it, and how much money he spent for expense in connection with the abstracting, and his salary, and everything else.

Q. You can tell us the name of the man who abstracted Deed No. 46,404?

A. Absolutely, I have it right in front of me.

Q. What is his name?

A. C. S. Weaver.

Q. And how much time did he spent on abstracting Deed No. 46,404?

A. Well, I couldn't tell you that, but I can tell you how much he spent in total amount.

Q. No, we are confining ourselves to Deed No. 46,404, shown on page 2, and you arrived, did you not, at an abstracting cost in connection with that particular deed, of $47.40?

A. The $47.40 is the average allocated actual cost for abstracting for the period that this deed was acquired.

Q. Now we are confining ourselves to Deed No. 46,404. You used, in your Exhibit No. 60, at page 2, in columns 2 and 6, an abstracting cost of $47.40 for that specific deed; isn't that so?

A. Yes, sir; I did.

Q. Now do you know what the specific cost of abstract-
5169. ing that specific deed was?

A. I might surprise you and find it, because I think I have it. It is more than $47 ——

Q. (Interposing.) Oh, Mr. Antonelli, do you know what the specific costs of abstracting that specific deed No. 46,404 were? Do you know or don't you?

A. I don't, because the Company did not keep records of the specific costs for each abstracting.

Q. All right.

Now then, your amount of $47.40, as the cost of abstracting used by you, as the cost of abstracting that specific deed, is an estimate derived from costs of abstracting a number of deeds, is it not?

A. No; sir.

Q. Are you caviling or do you have objection to the term "estimate"; is that it?

A. No; it is an allocated actual cost of the deeds and leases that have been abstracted. It cost the Company so much per year to abstract leases, and they had so many leases abstracted. By dividing the number of leases into the cost, I got the average cost; and that was the only practical way to get it and get done in time.

Q. Mr. Antonelli, isn't an average cost an estimated cost, what is the difference?

A. Oh, not at all.

5170 Q. Well, then, it is the term "estimated" that you were objecting to; is that right?

A. Yes, sir. I know that this cost of $47.40 is actual cost incurred by the Company in abstracting.

Q. How much time did it take Mr. Doakes to abstract that specific lease or deed?

Mr. WILDE. Weaver was the name.

The WITNESS. Judging from the amount, he probably spent 5 or 6 or 7 days.

By Mr. SLAFF:

Q. Do you know?

A. Sure I know. I know his salary, and judging from that he probably did spend that much time, and that is the average time it takes to abstract leases and deeds.

Q. Now getting away from averages, Mr. Antonelli, do you know the specific amount of time that Mr. Weaver was engaged in abstracting Deed No. 46,404; do you or don't you?

A. No; I said no; no, sir; I don't.

Q. Then you don't know what the cost to the Company of abstracting this one deed was?

Mr. MILDE. I object to the question. It has been asked and answered twice before.

Mr. SLAFF. Well, it may have been asked several times before, but I don't know whether it has been answered.

TRIAL EXAMINER. Let him answer it again.

5171 The WITNESS. No; I don't, and I would like to qualify my answer by saying I don't know because the Company did not keep separate the costs incurred in connection with abstracting; but I do know the actual average allocated price for abstracting.

By Mr. SLAFF:

Q. And that is what this $47.40 is, your conception of the average allocated cost—right?

A. Yes, sir; and this isn't any different than the pipe lines, or anything else.

For instance, the pipe line might have had, say, 1,000 feet, and later on we find out that the line is only 500 feet. Say we find out as of December 31, 1938, that we only had 500 feet. Therefore, we allocate the cost of the 1,000 feet to the 500 feet.

Q. And that you——

Mr. Milde (interposing). You mean you wrote that out?

The Witness. Well, we wrote out the 500 feet.

Trial Examiner. You wouldn't call that an estimated cost?

The Witness. No, that is an actual cost, only half of the line was gone.

By Mr. Slaff:

Q. You did make estimates in connection with this Exhibit 60, did you not?

5172 A. Yes, sir; I did.

Q. But these costs you consider outside of the category of estimates; and these are not estimates, but average allocated costs, is that right?

A. You refer to abstracting now?

Q. Yes.

A. The abstracting I consider actual costs.

Q. Average allocated actual costs would be a complete statement—right?

A. Yes.

Q. Does that also apply with respect to leaseholds, Account 330-2?

A. Yes, sir; it does.

Q. Now did you obtain your average allocated cost for abstracting leases in generally the same manner that you obtained it for abstracting deeds?

A. Yes, sir.

Q. That is to say, for each year you took the number of leases abstracted, the number of men who worked on abstracting leases for the Company, their salaries, and divided the amount of dollars paid by the number of leases they abstracted; is that it?

A. Yes; and sometimes, and for some years, the Company had abstracting done by outsiders. In that case we will show the total cost of abstracting, lease by lease.

5173 Q. And again, you would not consider that you had estimated the cost of abstracting any of these leases?

A. No, sir.

Q. Now with respect to Account No. 330-5, Other Land and Land Rights, were your abstracting costs developed in the same manner as we have discussed with respect to the other two accounts?

A. Yes, sir; that is true with all the land and lease accounts.

Q. Will you tell me whether Ford, Bacon & Davis made a labor performance study of the construction in connection with the Hope property in 1929?

Mr. MILDE. I object to that. It is not relevant to any question in this case.

TRIAL EXAMINER. I can't see the relevance just at present.

Mr. SLAFF. If it is not developed as relevant, it will be subject to a motion to strike.

Mr. MILDE. I think we might have a statement by counsel as to how he expects to make it relevant.

Mr. SLAFF. At this point I prefer not to make such a statement.

TRIAL EXAMINER. All right, you may reserve the right to move to strike if it isn't properly developed. The objection is overruled.

Mr. MILDE. Note an exception.

5174 The WITNESS. Ford, Bacon & Davis, in their valuation of the Hope properties as of 1929, priced in detail all of the compressing stations and other structures, and I presume they developed unit costs, similar unit costs to those that I have referred to this afternoon.

By Mr. SLAFF:

Q. Getting away from your presumption, Mr. Antonelli, do you know whether they developed such unit costs?

Mr. MILDE. I object, on the same grounds.

TRIAL EXAMINER. The objection is overruled.

Mr. MILDE. Note an exception.

The WITNESS. I don't know offhand, no, sir.

By Mr. SLAFF:

Q. In your original cost determination in this case, did you make any investigation to determine whether, in 1929 or thereabouts, Ford, Bacon & Davis had developed any unit costs and performance rates for the Hope properties?

A. Yes, I did.

Q. And what did you find?

A. Well, I can't recall offhand. I will refer to my papers and let you know.

Q. Well, where is that contained in your papers?

A. Oh, it is contained in the 80,000 pages that we have in connection with this original cost determination.

Q. And are you meaning to tell us now that just at this
5175 moment you don't know that Ford, Bacon & Davis did

develop such unit costs and performance rates for construction on the Hope property at that time?

Mr. MILDE. Objection.

TRIAL EXAMINER. Overruled.

Mr. MILDE. Note an exception.

The WITNESS. I think they have, but I would like to make certain.

By Mr. SLAFF:

Q. I have no objection, Mr. Antonelli, I want you to understand, to your verifying your answers.

Now did you use those rates of performance in any way in connection with the estimation of performance for your original cost determination?

A. I can't say offhand, I will have to refer to my papers.

Q. Well, Mr. Antonelli, don't you know now whether you did use those performance rates, developed by Ford, Bacon & Davis specifically for the Hope property in 1929, in connection with your original cost determination?

A. No, sir; I don't know offhand.

By "performance" you mean again the hours and not the costs, is that it?

Q. That is right.

A. We might have, but I am not certain. I will have
5176 to examine the working papers, and I will let you know.

Q. Did you have anything to do with that 1929 valuation of the Hope properties?

A. I think so, but I don't recall, it is so long ago, and I can't tell. There are so many jobs that we are doing that I can't tell you offhand. I will have to refer to the working papers.

Q. I notice you listed in your statement of qualifications in your Exhibit No. 20, "The companies for which I have done work of the foregoing nature include the following," and then you refer to the Hope Natural Gas Company, at page 3.

A. But there were several Hope Natural Gas Company jobs, and I think this refers to other jobs, in 1937, maybe, or 1923, or something like that, and I can't tell you which one.

Q. While you are checking this matter of whether or not unit performances were developed, and whether or not you used them in connection with your original cost determination, will you also refresh your recollection as to whether you had any con-

nection with that 1929 valuation; and if so, what the natu
of your connection was?

A. I will be glad to.

Q. Now turning to Account No. 331-2, Field Measuring an
Regulations Station Structures, shown on page 69 of your Ex
hibit, can you tell us whether or not any of the costs involve
5177 in constructing those boxes or houses, were included i
the miscellaneous costs incurred in connection with tha
account?

A. Well, I don't understand what you mean by "miscellaneou
costs" included in that account?

Q. Well, in the structure account, in 331-2, isn't there a sub
account, "Labor, Teaming, Freight and Miscellaneous Costs"?

A. Yes, sir.

Q. Now tell us what is meant by "miscellaneous costs" in tha
subaccount?

A. I don't have any miscellaneous costs.

Q. What?

A. I don't have any miscellaneous costs.

Q. What is meant by the term "miscellaneous costs" in tha
subaccount?

A. I don't have any miscellaneous costs in this subaccount, I
have material and I have labor.

Q. Now let's start all over again, Mr. Antonelli.

There is a subaccount, "Labor, Teaming, Freight and Mis
cellaneous Costs"?

A. Not in this account; not the way I developed it; no, sir.

Q. No; I realize that, Mr. Antonelli, but on the Company's
books, in the Company's records, getting away from page 69 fo
the moment?

5178 A. I don't know what is on the Company's books.

Q. You mean you don't know anything at all about any
thing that is on the Company's books?

A. Yes, I do, but I couldn't remember just every account.

Q. I am not asking you to remember the specific details of
every account. Just getting away from your page 69, within the
Account "Field Measuring and Regulating Station Structures"
there is a sub-account, is there not, "Labor, Teaming, Freight and
Miscellaneous Costs"; isn't that so?

A. I don't recall. I can't say unless I look up the books and see

Q. Well, you told me just a few minutes ago there was.

A. No; I never said anything about this account having miscellaneous costs, unless you mean by "miscellaneous costs" the way we use it sometimes,—for instance, we have in a structure—not in this structure, but in other structures,—main items such as lumber and concrete and roofing, and so on, and then we have some miscellaneous costs such as fixtures or plumbing or that type. Is that what you have in mind?

Q. Mr. Antonelli, doesn't practically every one of the accounts of the Company contain a provision, a subdivision for miscellaneous costs?

A. In the case of pipe lines they do have miscellaneous costs, and that includes miscellaneous small materials and
5179 supplies consumed during construction, and board, and doctors' bills, and stamps, and things like that.

Q. How about field lines; does that account also have a miscellaneous sub-account?

A. Yes; pipe lines are field lines.

Q. How about compressor stations?

A. Yes, I think the compressing stations have.

Q. How about field measuring and regulating station structures?

A. I don't recall about this account; I know some other accounts have it.

Q. All right, Mr. Antonelli, will you check that account and determine for us whether or not there is provision made in this account for miscellaneous costs?

A. Yes, sir. The structures are so small, you know, and I don't think they would have miscellaneous costs for this account.

Q. Well, you will check and find out and report to us?

A. Yes.

Q. Now you say you found a voucher covering 700 of these 1300 wood boxes, is that right?

A. Yes, sir; I found several vouchers. One of the vouchers was for 689 meter boxes. The voucher was L-92, 1919.

Q. And you used the cost as developed from that voucher for the bulk of the 1386 boxes?

5180 A. Well, this voucher covers the construction and installation of part of these 1300 boxes, yes.

Q. Now first off, where was that expense charged to in the first instance, do you know?

A. I think it was charged to operation.

Q. That voucher covering some 680-odd boxes?

A. Yes, sir.

Q. When were these 1300 boxes constructed, do you know?

A. They were constructed at about the period of this voucher. I will explain that. The company will build these boxes and keep them at the warehouses and use them as they need them. They are small boxes, and usually they do this work when they are not very busy, in the summer, and they store them and then use them later. So that is why they all happen to be in 1919. I assume that that is the answer, or I am positive that that is the answer.

Q. You are positive that is the answer with respect to the entire 1300, is that right?

A. No; there were some other vouchers that show some other boxes installed in different years. This was the large one.

Q. Can you tell us when the balance of those boxes was constructed?

A. I could probably tell you about 50 more, the actual cost for approximately 50 other boxes.

5181 Q. When were those constructed?

A. Various years, 1920 and 1923 ——

Q. (Interposing.) Were those all expensed?

A. Yes, sir; they were.

Q. All vouchers that you found in connection with these boxes had been charged to operating expense, the costs had been charged to operating expense?

A. Yes, sir.

Q. Now with respect to the houses, the 122 houses, do you know how those were charged, that is, the costs in connection therewith?

A. They were charged to operation.

Q. Now going back to another matter, Mr. Antonelli, can you tell us now whether or not it is a fact that your Company, the Hope Company, has always been required to show the cost of its property in its capital account?

A. No, sir; I cannot. I don't know what were the Company's policies, and I wasn't interested in finding out.

Q. Now how long have you been in this business of valuing public utility properties?

A. Any public utility property?

Q. Yes.

A. Since 1919.

Q. And in the course of that time, have you familiarized yourself with the Systems of Accounts under which the utilities
5182 which you were valuing were required to operate?

A. I investigated the books in order to get the costs, yes. I know something about——

Q. (Interposing.) You know something about the Systems of Accounts?

A. Yes.

Q. Now do you know something about the System of Accounts under which the Hope Company operated in West Virginia prior to the present System of Accounts, the prior system being in evidence here as Exhibit No. 12, I believe?

A. Yes, sir.

Q. And do you also know something about the System of Accounts of the West Virginia Commission under which the Hope Company was required to operate from 1923 to 1931?

A. Yes, sir.

Q. You do?

A. Yes, sir.

Q. Do you know whether, under those Systems of Accounts, the Hope Company was required to show in its fixed capital accounts the cost of its properties?

A. Yes, I do.

Q. And it is a fact, is it not, that under the Systems of Accounts under which the Hope Company was operating, from 1923 on, at least, of the West Virginia Commission, it has always been
5183 required to show in its fixed capital accounts the cost of its properties?

Mr. MILDE. I object to that. The accounts are in evidence, and it is not a question of fact, it is a matter of interpretation of the accounts.

Mr. SLAFF. I don't know what interpretation there is.

Mr. MILDE. Also, it is not proper cross-examination of Mr. Antonelli.

TRIAL EXAMINER. Well, so far as the existence of the facts are concerned, I think they are entirely clear from the evidence. If the purpose is to test the knowledge and reliability of the witness, that is something else.

Mr. MILDE. Well, as I understand it, that isn't the purpose of the question. Mr. Antonelli hasn't been testifying as to the interpretation of Codes of Accounts. He has testified that it hasn't been necessary for his original cost determination.

Mr. Slaff might as well interrogate Mr. Antonelli about his qualifications on the Ohio Code of Accounts, or something else, if he just wants to know how much he knows about accounting. It certainly has nothing to do with what he did, nor does it test his reliability or credibility as a witness on the subject for which he was presented.

TRIAL EXAMINER. Well, it doesn't seem to me that it is of great importance, anyway, so far as that is concerned.

The objection is overruled.

5184 Mr. MILDE. Exception.

* * *

The WITNESS. I don't know what is required, but I could tell you what actually Hope did.

Br. Mr. SLAFF:

Q. I am asking you whether you know what they were required to do under the governing Systems of Accounts from at least 1923 on?

A. Well, I could tell you from this Code of Accounts what was required, yes. I have read this Code of Accounts, and I know what is required.

Q. And was the Company, the Hope Company, required to show, in its fixed capital accounts, the cost of its properties?

A. According to the Code of Accounts prescribed as of 1923, yes.

Q. You determined the cost of the Hope Company's properties from sources other than the fixed capital accounts of the Hope Company, is that correct?

A. I went back to the vouchers and records where the actual cost was recorded, because I found that the fixed capital did not reflect the actual or complete cost of these properties.

5185 Q. Well, is that the equivalent of saying, are you telling us, then, Mr. Antonelli, that the Hope Company—in your judgment, at least—did not keep its fixed capital accounts in the manner in which they were required to keep them under the controlling Systems of Accounts, from 1923 on?

A. I am not a judge of that, I am not experienced enough to say that. I don't know.

Q. Are you telling us that the fixed capital accounts of the Company did not show the cost of the Company's properties?

A. It showed some costs, but they didn't show the complete costs.

Q. All right.

Now have you testified earlier today, or yesterday, that you were not interested in the bookkeeping or the accounting practices of the Company, and that your job was to determine the original cost of the Hope properties?

A. Yes, sir; to determine the original cost of the Hope properties from the Hope records, vouchers, and so on.

Q. And it is your belief, is it, that that determination can be made regardless of the Company's accounting practices?

A. That is the only practical way that one could make original cost, at least that is my experience.

Q. And is it your statement that such a determination of cost can be made without regard to the accounting for the
5186 various transactions?

A. My experience wasn't as difficult as that. What I did was, as I said before, make a list of all of the items in the system; then go to the various records of the Company where the actual costs for these items were recorded; and that is all I did, all I had to do. It was just a tedious job finding the cost of each item.

Q. I should like at this time, Mr. Antonelli, to find out, if I can, from you what were the principles that underlay your determination—and I am asking you now whether it is your testimony that the costs of property can be determined without a consideration of how the transactions were accounted for in the first instance?

A. Well, I did take that into consideration in connection with the investigation of the vouchers and records of the Company. Naturally, the vouchers will show the transactions, and I read them very carefully to see what happened to the various items. But I confined myself to the individual items and what happened to each individual item, and not what was the practice of the Company or what the Company did on their books, or what-not, or what was the policy of the Company. I didn't care if the item was expensed or capitalized, or what-not.

My job was to find the actual cost, the amount of money that the Company paid for these properties.

5187 Q. Mr. Antonelli, is it not a fact that for two identical construction jobs, the costs may vary, depending upon the accounting procedures of the two companies which have constructed those identical jobs?

A. I don't understand the question; will you explain it?

Q. Surely. Let's put a case to you.

Let's consider a pole line construction—everything else is the same, of course, all other factors are the same—a construction by two companies. In each of the cases the company has taken 500 poles out of its storehouse; in each of the cases each of the companies had, let us say, 2,000 poles in its warehouse, not specifically identified; and the poles had been acquired by each of the companies in the following manner: 1,000 at $1 apiece, and the remaining 1,000 at $2 apiece. Do you follow me that far?

A. Yes; I follow you.

Q. Now suppose the first company accounts on the "first in-first out" method, and the second company accounts on the average cost method. What is the cost to the first company of the material in the pole line of the 500 poles, and what is the cost to the second company of the material in the pole line which they construct?

A. Well, I can't answer that question; it doesn't mean anything.

5188 Q. Mr. Antonelli, you were discussing "first in-first out" yesterday, weren't you?

A. Yes.

Q. That is the way you priced out the communications equipment inventory of this Company, wasn't it?

A. Yes; sir.

Q. You know what "first in-first out" means, don't you?

A. Yes.

Q. You know what "average" means?

A. Yes.

Q. All right. Now then, confining ourselves to the first company, under the hypothesis I have given you, what is the cost of those 500 poles in its pole line? That is the company that uses the "first in-first out" method of accounting.

A. Well, the cost would be that the company will use the most recent poles first, and will keep on using them until it exhausts all of its poles.

Q. What is the cost to the company of the 500 poles in its pole line under the "first in-first out" method of accounting?

A. Well, what was the cost, a dollar apiece?
Q. A dollar apiece.
A. It would be $500.
Q. Well, what is the cost of those identical 500 poles
5189 to the second company which accounts on the average?
A. That was a dollar apiece?
Q. The costs were identical.
A. It would be $500.
Q. On the average method?
A. Well, you have 500 poles——
Q. (Interposing.) Perhaps you don't understand the question, Mr. Antonelli.

The 2,000 poles were put into the warehouse and none of them were tagged. The first 1,000 that went into the warehouse cost $1 apiece, and the second 1,000 that went in cost $2 apiece. Now the first company accounts on the "first in-first out" method; the second company accounts on the average cost method.

Now will you tell us what the cost of those 500 poles in the pole line is, as far as the second company is concerned?

Mr. MILDE. I object to that question unless Mr. Slaff will state to the witness what he means by the word "cost." Does he mean the actual cost or the accounting cost?

Mr. SLAFF. Mr. Examiner, I am trying to find out from the witness what he means by "cost."

Mr. MILDE. No, he slips in this word "cost" without any statement to the witness as to whether he wants the actual cost or the accounting cost, or the cost——

Mr. SLAFF (interposing). This witness can qualify all over
the lot, and I have no objection to his qualifying his
5190 answer if he feels he can't answer it unqualified.

Mr. MILDE. The answer is inherent in Mr. Slaff's assumption. If he means actual cost, he said that all of these poles cost exactly the same thing to both companies. So obviously, by "cost," when he goes on to ask a question about it, he must mean something else besides actual cost.

You say to a witness, "500 poles cost one company the same amount of money as they do the other company; now what does it cost Company A and what does it cost Company B?"

Now the word "cost" the second time isn't used in the same way. I think the witness is entitled to a statement by the cross-examiner as to what "cost" he wants him to figure out.

Mr. SLAFF. This witness has used allocated cost; he has used cost; he has used estimated cost; he has used first in-first out cost. He knows what costs are—maybe.

TRIAL EXAMINER. This witness is an expert in determining costs, and he is being asked now how he would make that determination and what his determination would be.

Mr. MILDE. I thought he was being asked what the cost was as meant by Mr. Slaff, because he starts out with the premise that these things cost the same amount. So when he says——

Mr. SLAFF (interposing). I say that the first 1,000 poles
5191 cost each of the companies a dollar apiece, and the second 1,000 that went into the warehouse cost each of the companies $2 apiece.

Mr. MILDE. So it is perfectly apparent that all these poles cost Company A and Company B exactly the same amount of money.

Mr. SLAFF. Mr. Antonelli, do you understand now what Mr. Milde wants you to testify to?

The WITNESS. No, sir; I don't.

By Mr. SLAFF:

Q. Maybe you understand my question?

A. No; I don't understand your question. It is so mixed up.

Q. Let's start from the beginning; let's get the assumption straight.

TRIAL EXAMINER. Well, you understand the assumptions, don't you?

The WITNESS. Not quite; I want to make sure what he has in mind.

TRIAL EXAMINER. Start over, then.

By Mr. SLAFF:

Q. Each one of the companies buys the first 1,000 poles at a dollar apiece. That is clear, isn't it?

A. Yes.

Q. They each buy the second 1,000 poles at $2 apiece—right?

5192 A. Yes.

Q. In each case the 2,000 poles are in the warehouse, unidentified, untagged. The first company accounts on the "first in-first out" method; the second company accounts on the average cost method. Each one of these companies constructs a 500-pole run. Now what is the cost to the first company of the 500 poles in that pole line which it has constructed?

A. Well, that is not the way we did it, but I will answer your question. For one company it will be $1.50 per pole, and for the other it will be $2 per pole.

Q. You are a little off aren't you, Mr. Antonelli?

A. Then I don't understand your question.

Q. "First in-first out," what does that mean to you?

A. On the "first in-first out" theory, you exhaust the latest costs or the latest poles, and then you go back to the first ones.

Q. Aren't you thinking of "last in-first out," Mr. Antonelli?

A. That is right. No, "first in-first out." We took out the oldest poles and we retired the oldest poles first, and we assume that the poles that are in there now are the latest poles.

Q. What poles would go out of the warehouse first on the "first in-first out" method, Mr. Antonelli?

5193 A. The oldest poles will go out first.

Q. Go out of the warehouse?

A. The latest poles will go out of the warehouse, the oldest poles will go out from the inventory.

Q. We haven't had any poles in the field and in our inventory, we have just got 2,000 poles in each of the warehouses.

A. Yes.

5194 Q. Now, under the "first in—first out" method, which poles would go out first, the oldest ones?

A. That is not what I did at all. I don't know which poles would go out under the "first in—first out" method.

TRIAL EXAMINER. You mean which ones would be charged off the books, don't you?

Mr. SLAFF. Certainly.

TRIAL EXAMINER. He is talking about taking the poles physically out of the warehouse and I assume the first ones they would take out are the last ones they put on the pile.

By M. SLAFF:

Q. Let's get back to the same language. Can you tell us now what is the cost of the 500 poles in the pole line under the "first in—first out" method of accounting for cost?

A. In the warehouse or in the inventory?

Q. In the pole line that has been constructed.

A. I am sorry, but I don't understand your question. I want to make sure now. We were talking about warehouses and now you are talking about the line. What are you talking about?

Q. Mr. Antonelli, do you mean now that you don't understand what the question was that was put to you?

A. No, sir.

Q. Do you want to start all over again, from the be-
5195 ginning?

A. Yes.

Q. Will you just listen reasonably carefully then? You do understand the underlying assumptions that each of the two companies bought a thousand poles at $1 apiece, put them into the warehouse; and each of the companies then bought another thousand poles at $2 apiece and put them in the warehouse.

Then, each of the companies withdrew 500 untagged poles from the warehouse and constructed a pole line. Is that all clear to you, up to that point?

A. Yes, sir.

Q. Now, then, what is the cost of the pole line to the first company which counts on the "first in—first out" basis?

TRIAL EXAMINER. You are called on in each case to determine the cost of those poles.

The WITNESS. Well, they are untagged, those poles?

By Mr. SLAFF:

Q. Completely untagged.

A. They won't know which are the dollar poles and which are the $2 poles, and they are all mixed up together. Therefore, they will have to use the average price.

Q. Well, my assumption, Mr. Antonelli, is that the first company does not use the average price but uses the "first in—first out" method of pricing.

5196 A. That assumption is wrong because if the poles are untagged, the company does not know which are the dollar poles and which are the $2 poles.

Q. Mr. Antonelli, don't you know that it is a thoroughly sound, accepted method of accounting to account "first in—first out" where items in a warehouse are unidentifiable?

A. No, sir.

TRIAL EXAMINER. Isn't that what you did?

The WITNESS. No; I did that in the case of the inventory. I was talking about the inventory, Mr. Examiner, and not about the warehouse.

By Mr. SLAFF:

Q. Well, Mr. Antonelli, are you intent now on demonstrating that you don't know anything about accounting; is that it?

A. No, I don't say that; no, sir.

* * *

5572 PETER ANTONELLI, having been previously sworn, took the stand and testified further as follows:

Cross-examination by Mr. SLAFF:

Q. Mr. Antonelli, you will recollect that towards the conclusion of your examination on Tuesday we were discuss-
5573 ing an illustration which I had put to you with respect to cost of identical property to two different companies. Do you have the facts of that illustration in mind?

A. Yes, sir; I do. I am sorry I misunderstood you. I thought you were talking about communication equipment.

Q. No; you understand that was purely an illustration I was giving?

A. Yes.

Q. And with respect to that I had asked you to tell me what the cost of the poles in the pole line of the first company which are accounted on a first-in, first-out basis was. Can you tell me that now?

A. As far as the actual cost is concerned, the cost to the "A" company is the same as the cost to the "B" company.

Q. No, I am not asking for a comparison. I am asking you in dollars now. Let us take "A" company which accounts on a first-in and first-out basis and "B" company as the company which accounts on an average basis. Now, will you tell me what is the cost in dollars of the poles in the pole line of company "A"?

A. From a bookkeeping point of view?

Q. What is the cost?

A. Well, what, do you mean, actual cost or bookkeeping cost?

Q. What is the actual cost in dollars of the poles in
5574 the pole line of company "A"?

A. Well, I will have to estimate it.

Q. Well, now will you tell me, why, first off, you have to estimate it on the basis of the facts which I have given you?

A. Well, on the basis of the facts which you have given me, which is not the actual cost but just an accounting cost, the cost of that particular line would be $500.

Q. Now, you say that that is not the actual cost. Is that correct?

A. That is correct; yes.

Q. Now, will you tell me why that is not the actual cost?

A. Because the company spent $3,000 for the poles that they purchased.

Q. No; there is no necessity at this time, I believe, Mr. Antonelli, to bring in company business. We will make the comparison, you needn't worry about that, we will get around to the problem of comparing the two companies, but confine yourself, please, now to company "A" and tell me why the actual cost of those 500 poles is not $500?

A. Because the company selected to take out of the $3,000 five hundred poles at a dollar price, which is not the actual price of these 500 poles. They just chose to use a dollar a pole,
5575 they could have used just as well $1.50 or $2.00 but they choose to use $1.00 a pole.

Q. Then you mean to tell me, that a company which accounts on a first-in, first-out basis for such materials coming from its storehouse does not by that method show its actual costs on its books?

A. The company will show the actual cost on the books at the time they exhaust the 3,000 poles.

Q. Well, we are not at that time yet, Mr. Antonelli, we are still at the 500 poles in the pole line.

A. No; they don't show the actual cost of these 500 poles, no, sir.

Q. That would apply equally, would it, to company "C" which is a new company we are going to bring in now which accounts on a last-in, first-out basis? Under your approach, if that company accounted for 500 poles, all other conditions being the same as those you have been discussing, on a last-in, first-out basis, its books would not show the actual cost of its property? Is that correct?

A. No, sir; that is just a bookkeeping method of keeping the books.

Q. So that it is your position, isn't it, that the only actual costs which exist in such a situation are average costs? Is that correct?

A. I think it is about the best method that you could
5576 use——

Q. (Interposing.) No, I am not interested in what you think is the best method, Mr. Antonelli, at this point. I am asking you whether it is your position that the only actual costs in such a situation are the average costs.

Mr. MILDE. Well, I object to that question, he has just answered it.

Mr. SLAFF. No, he definitely skidded away from answering it, that is why I repeated it.

The WITNESS. Well, as far as I am concerned personally, I think the average gives you about the best results.

By Mr. SLAFF:

Q. That is apparent as I understand your testimony, Mr. Antonelli, but I am asking you if it is also your position that that average cost is the only actual cost?

A. Inasmuch as the poles were not tagged, they were all mixed up and you spent $3,000 for the poles, I think the average is the best method to take the poles out of the warehouse.

Q. Mr. Antonelli, confining yourself to the 500 poles in the pole line, will you tell us whether it is your position that the only actual cost of those poles is the average cost?

A. The actual pole cost is the $3,000, now if the company is going to take them out and what they want to do with it,
5577 of course, is a problem of accounting policy.

Q. Perhaps you don't—do you realize we are confining ourselves to the 500 poles in the pole line?

A. Well, in the case of the 500 poles I think, as far as I know now, the only method would be the average cost.

Q. And I am not sure that your answer is quite complete. Do you mean, Mr. Antonelli, that the only actual cost of those poles is the average cost?

A. Under the circumstances I say yes.

Q. So that in the illustration that we have been discussing a company which accounts on a first-in, first-out basis or accounts on a last-in, first-out basis does not state its actual costs on its book. Is that correct?

* * *

5579 The WITNESS. I don't know in this case what the answer would be, but, as I said before, that wasn't the way I derived my original cost.

By Mr. SLAFF:

Q. That is thoroughly patent, Mr. Antonelli, and I think yo have explained several times how you derived your original cos and what we are doing now is trying to test the validity of you determination.

Now, we know that isn't the way you did it. Now, then, can yo tell us, directly, Mr. Antonelli, whether in this situation in you view a company which accounts in this type of situation on th first-in, first-out method or on the last-in, first-out method is o is not stating on its books the actual cost of its property?

A. I don't know, I can't tell you because in that thing I did I didn't have any occasion to use that kind of a method. I had th actual cost.

Q. You had occasion to determine actual cost, did you not?

A. Yes, sir.

5580 Q. As you conceived it?

A. Yes; I did.

Q. And you had, then, to determine what was actual cost o if there was actual cost or if there was more than one way o stating actual cost, is that right?

A. Yes; I tried to determine the actual cost from the company records to the best of my ability, yes.

Q. And you had to determine in your own mind whether there was simply one way of stating actual cost or more than one way o stating actual cost. Isn't that correct?

A. Well, my actual cost was a matter of fact. I did find it in the company records, it was recorded, it shows that the company paid so much for certain items.

Q. Now, Mr. Antonelli, will you please answer my question? You had to determine in your own mind whether there was just one way of determining actual cost or more than one way of determining actual cost, isn't that right?

A. Yes.

Q. And you came to the conclusion, as I understand it, that there was only one way of determining actual cost?

A. Yes.

Q. Now then, in the illustration which we have been discussing. will you tell us whether in your view the company which accounted

for the 500 poles we have been discussing on the first-in, first-

5581 out basis or the company which accounted on the last-in, first-out method would or would not be stating its actual cost of those poles on its books?

A. From the standpoint of actual cost, both of the methods are wrong and if I had a case like that I would try to remedy it to get the actual cost by going back and finding and trying to determine what was the actual cost. If I couldn't have gotten it, I would have tried to estimate it. I wouldn't use the first method or the last method.

Q. And is it your view, then, if you can answer the question specifically and directly, that the company which accounts on the first-in, first-out method and the company which accounts on the last-in, first-out method are not stating on their books the actual cost of that property?

* * *

5582 The WITNESS. My answer is no, they are not, in this illustration.

* * *

5583 By Mr. SLAFF:

Q. Mr. Antonelli, we were discussing, before lunch, an illustration which I had put to you in connection with your statements respecting the ascertainment of actual cost and what is actual cost, and so on, and I should like to continue along that line with a somewhat different problem for you.

Using our three companies, A, B, and C, will you assume the following: that identical properties are about to be constructed in the illustration; that utility A capitalizes interest during construction only on jobs which take 30 days or more and which cost $5,000 or more; that utility B capitalizes interest during construction only on jobs which take 30 days or more and which cost $2,000 or more, and that utility C capitalizes interest during
5584 construction only on jobs which take 60 days or longer, and cost $4,000 or more.

Now, before going into the questions that I want to develop in that specific example, I would like to ask you whether there is anything unusual in the type of situations which I have given you?

A. No, sir.

Q. In other words, those are normal accounting practices within the natural gas industry?

Mr. MILDE. I object, unless he qualifies this witness to testify as to normal accounting practices in the natural gas industry. He hasn't been presented as an accountant.

Mr. SLAFF. You qualified him on that specific matter, in his Exhibit 20, when he specifically spoke of how he had used interest during construction in this case. Not finding specific records on the company's books, he assumed, as I recollect, interest during construction on jobs of 30 days or more and costing $5,000 or more.

Of course, if he wasn't qualified to make that assumption, then I move to strike all his direct testimony in that respect.

Mr. MILDE. That wasn't the question you asked him. You asked him as to general accounting practices in the natural gas industry. If you want to qualify him as to his experience and knowledge of the general accounting practices in the natural gas industry that is up to you, but that isn't a part of his direct testimony.

5585 By Mr. SLAFF:

Q. Mr. Antonelli, do you know anything about accounting practices in the natural gas industry?

A. No, sir.

Q. Do you mean to tell me you testified here on orignial cost without knowing anything about accounting practices in the natural gas industry? Is that what you are telling us?

A. I determined the original cost of this property.

Mr. SLAFF. Mr. Examiner, may we have the witness instructed to answer this question?

* * *

TRIAL EXAMINER. You may answer the question.

The WITNESS. I say that I do not know about the accounting practices of the gas industry. I did not have to know the accounting practices of the gas industry because my job was to determine the original cost from the company's records, and I went to these records and got the original cost of each item; and the accounting practices were not involved or did not concern me at all.

5586 By Mr. SLAFF:

Q. Didn't you testify that you followed the accounting principles in the Federal Power Commission system of accounts and the West Virginia system of accounts?

A. Yes, sir; as much as possible, and as I said before that was in connection with classifying the properties in accordance with the new code of accounts.

Q. And do you mean to tell us, Mr. Antonelli ——

* * *

The WITNESS. And I did that, I set up all the properties and classified the properties, using these new accounts and including in each account what was said in the code of accounts; yes, sir.

By Mr. SLAFF:

Q. Mr. Antonelli, are you telling us now that you claim to have followed the accounting principles as laid down in those two systems of accounts, without knowing anything about the accounting practices in the natural gas industry?

A. Well, what do you mean by "accounting practices"?

Q. You told us a few minutes ago that you didn't know anything about the accounting practices in the natural gas industry. What did you mean when you said that?

A. By that I meant whatever the policies were of the
5587 various companies. Each company might have a different policy and a different way of setting up their books.

Q. You didn't go into the specific policies of each company, is that right?

A. Well, I am referring to the Hope Company.

Q. Well, do you know anything about general accounting practices in the natural gas industry?

A. I didn't have to know.

Q. Well, do you, or don't you?

Trial EXAMINER. Please answer the question.

The WITNESS. No, sir; I don't know.

By Mr. SLAFF:

Q. And we can rely on that last answer of yours, Mr. Antonelli, in evaluating your testimony in this case, can we?

A. Well, my testimony——

Q. (Interposing.) No, no—will you answer this question which I have just put to you? Can we rely on this last answer of yours as being a true and correct answer in evaluating your testimony in this case?

Mr. MILDE. I object to that type of question.

Mr. SLAFF. There is nothing objectionable about it.

Mr. MILDE. Who is "we," and what do you mean by "evaluating"?

Trial EXAMINER. The objection is overruled.

The WITNESS. Will you read the question, please?

5588 (The question was read by the reporter.)

Mr. MILDE. I wonder if it wouldn't be fairer to the witness to hear the preceding question and answer?

Mr. SLAFF. By all means.

Trial EXAMINER. Read the preceding question and answer.

(The reporter read—Line 6 to Line 14, inclusive, page 5387—as follows:)

"Q. Well, do you know anything about general accounting practices in the natural gas industry?

"A. I didn't have to know.

"Q. Well, do you, or don't you?

"Trial EXAMINER. Please answer the question.

"The WITNESS. No, sir, I don't.

By Mr. SLAFF:

"Q. And we can rely on that last answer of yours, Mr. Antonelli, in evaluating your testimony in this case, can we?"

The WITNESS. I again say that I did not have to know—

By Mr. SLAFF:

Q. (Interposing.) Mr. Antonelli, will you please listen to the question and will you please try to answer the question which I have put to you?

Mr. SLAFF. Will you read it again?

(The following was read by the reporter:)

"Q. And we can rely on that last answer of yours,
5589 Mr. Antonelli, in evaluating your testimony in the case, can we?"

The WITNESS. I can't answer that question. I don't know how you want to rely on it.

By Mr. SLAFF:

Q. I will tell you what I mean. Can we accept that last answer as a true and correct answer on your part in evaluating your oral testimony?

A. My answer was that it wasn't necessary for me to know the accounting practices ——.

Trial EXAMINER (Interposing). That doesn't answer the question, Mr. Antonelli.

Mr. MILDE. Well, it is a perfectly unfair question because it assumes that this witness doesn't tell the truth every time he answers a question—and he does.

Mr. SLAFF. No; I want him, just as you have pointed out, to realize fully what the last question was and the answer that he

made, and on that basis I want him to tell us whether we can rely on that in evaluating his testimony as a true and correct response.

Mr. MILDE. Well, that is no way to ask a witness a question or to arrive at the result that Mr. Slaff wants to reach—"Can we rely on it?" That is perfectly unintelligible. If he wants to say to the witness: "Well, now, do you understand fully
5590 that last question and is your answer a full and complete answer, and do you understand what you are saying?", that is all right, but when he says, "Can we rely in evaluating"—that is perfectly meaningless to any witness, who isn't a lawyer, I would say.

Trial EXAMINER. All right, let's see. Do you understand the question, Mr. Antonelli?

The WITNESS. Yes; I do.

Mr. MILDE. Well, then, answer it.

Trial EXAMINER. It seems to be meaningful to him.

The WITNESS. Well, I don't know how to answer it, Mr. Examiner.

Trial EXAMINER. Well, it seems to me that if you understand what the question means it shouldn't be difficult to answer.

The WITNESS. But, as I said before, it wasn't necessary for me to know anything about ——

Trial EXAMINER (Interposing). We understand your position in that respect all right; that is entirely clear.

The WITNESS. Well, with the qualification that it wasn't necessary for me to know the policies and accounting practices of the company, I will say "Yes."

By Mr. SLAFF:

Q. All right. You do know something about interest during construction, don't you?

A. Well, I applied these interests to these various costs.

5591 Q. And you do know, or purport to know, something about actual costs, too; that is correct?

A. Yes, sir.

Q. All right. Now, you have before you the assumptions I have given you with respect to these three utility companies, do you?

A. Yes, sir.

Q. Now, will you assume also that the cost of money to all companies is the same, 6 percent per annum?

A. Yes.

Q. Now, let us assume that an identical construction job is done by you for the companies, and the job lasts 60 days and costs $2,500. Now, will you tell us what is the cost of that job to each of the three companies?

Mr. MILDE. Well, again, I object to that question unless we have the cross-examiner state what type of cost he means.

Mr. SLAFF. Why, Antonelli's actual costs.

The WITNESS. The job costs, you say, $2,500?

By Mr. SLAFF:

Q. Yes, $2,500.

A. And you want to find the interest?

Q. No, no; that is inclusive of all costs other than interest, if any. Now, I want you to tell me the actual cost of that job to Utility A, to Utility B and to Utility C?

A. Let me see now if I understand your problem. On
5592 A Company the interest was 30 days, capitalized 30 days, and the amount should be $500 or over?

Q. $5,000 or over.

A. Yes, sir. The second one was 30 days and the amount was $2,000 or over?

Q. That is right.

A. And third was 60 days, and the amount was $4,000 or over?

Q. That is right.

A. And the problem was that you had a two months' period now?

Q. Yes, at a cost of $2,500.

A. On the first one, inasmuch as the amount is less than the $5,000, there will be no interested included.

Q. So the cost would be $2,500?

A. $2,500.

Q. The actual cost of that construction?

A. That is, under your assumption.

Q. That is right. Now, how about the second one?

A. The second one—it is 30 days and you allowed me $2,000 or over. Therefore, for the first $2,000 you don't have to pay interest, and you are going to pay interest for the $500, and the interest you pay on the $500, you pay—I assume under your
5593 illustration—for a month, and it would be $25 extra, making the amount $2,025. That is the assumption that you make. On the third case, you have 60 days and $4,000. There-

fore, you pay interest on the $2,000. On the last company, you don't pay any interest at all.

Q. Well, I think we are in agreement, Mr. Antonelli, as to your answer and your method with respect to Utilities A and C, the first and the last, so let's just review that. With respect to those two, the actual cost of that job is $2,500; is that correct?

A. Yes.

Q. Now, let's go to Utility B. Before putting that question, let me put this question to you: When you, in your original cost study, capitalized interest during construction on jobs costing $5,000 or more, and lasting 30 days or more, suppose a job costs $6,000 and lasted 60 days, what interest did you capitalize?

A. I assumed that the money will be—that we will have to have half of the interest— you don't need all the money at the beginning and we will need only half of it at any time. In other words, use 3 percent instead of 6 percent per annum.

Q. On the full amount?

A. On the full amount.

Q. Now, with respect to the company which I have designated as Utility B in the illustration which I have given
5594 you, will you tell us again what the actual cost of that job is, and how you arrived at it?

A. I was using your method, now.

Q. Using the assumptions that I gave you.

A. I said that I assumed that you told me to use 6 percent——

Q. (Interposing) Per annum?

A. Per annum.

Q. That is right.

A. And I just did that—I used half a percent per month. But in my case, in the original cost I used a quarter of a percent.

Q. I realize that. Will you tell us in this illustration I have given you, again, what is the actual cost of that job to Utility B?

A. It will be $2,000 plus one month's interest on the $500. Based on your assumption that would be $2,025; based on my assumption it would be $2,012.50.

Q. Well, in any event, Mr. Antonelli, is it true that in such a case you get a different actual cost for the same job for one utility than for another?

A. No, sir.

Q. Well, perhaps I misunderstood you, but did you tell us that the actual cost of the job for Utilities A and C was $2,500?

5595 A. Yes.

Q. Did you tell us, now, that the actual cost of the job for Utility B is either $2,525 or $2,512.50?

A. That is right, because——

Q. (Interposing.) All right——

Mr. MILDE (interposing). Let him finish.

Mr. SLAFF. Go ahead, if you want to expain it.

The WITNESS. No; that is all right.

By Mr. SLAFF:

Q. So, as I understand it, you do have one actual cost for the first utility and a different actual cost for the same job for the second utility; isn't that correct?

A. You are to B now?

Q. Surely.

A. Yes; but in one instance I assumed that the money was available, you had the money at the beginning to start the job and you had to pay interest right before you started the job; and on the other I assumed that the money was available as you needed it, and you didn't need to have all the money at the beginning or all at the end.

Q. Perhaps you don't understand me, Mr. Antonelli.

Confining ourselves now to a comparison of Utility A and Utility B, in one case you tell us the cost is $2,500, the actual cost, and in another case, using your method, $2,512.50, is that correct?

5596 A. Well, that was again an accounting practice of the company, and it was due to the way the company chose to do their work.

Q. Surely, and it was, in both cases, the actual cost of the property to the utility; was it not?

A. No; I wouldn't say that.

Q. Now, then, you want to change your answer, as I understand it, to the effect that one of those costs is not the actual cost to the utility involved; is that so?

A. Well, it all depends on what the company decides to do. They both might be actual costs, it all depends on what the company did actually spend.

Q. I have told you, Mr. Antonelli, just exactly what the company spent and what the company in each case decided to do.

* * *

5597 Q. All of the conditions, Mr. Antonelli, are the same,
5598 except as I have told you and as I originally told you, the decision of each of the companies as to the type of job on

which they will capitalize interest during construction. Now, with that in mind, do you want to change any of your previous answers as to what was the actual cost to any of the companies involved?

A. I still say the actual cost was what actually the company's decision was to handle this matter and how they spent.

Q. Now, then, tell us in dollars what was the actual cost of the property to Utility A?

A. Well, under the method chosen by the company, it will be $2,000.

Q. $2,500, you mean?

A. $2,500, yes, but of course that was just the bookkeeping method that the company chose to follow.

Q. Well, is that, or is that not, in your judgment, the actual cost of that property to that company?

A. That is the cost that the company will show on its books.

Q. Is it, or is it not, the actual cost of that property, Mr. Antonelli?

A. Well, somebody must have paid some more money for the interest, or somebody lost the interest. So I would say that it isn't the actual cost.

5599 Q. It is not?

A. No; it is not the actual cost.

Q. Now, then, with respect to the second company, what is the actual cost?

A. The actual cost will be, under the assumption, providing the company secured the money at—say it had to have only part of the money to start with and part of the money during the construction, the actual cost will be $2,500 plus the interest of $12.50 or $25.

Q. And if I understand in your last answer before this one, you then did not determine the actual cost of the Hope Company property; is that correct?

A. Yes; I did.

Q. Was there any cost on jobs of less than $5,000 and less than 30 days of construction time for interest?

A. No; but the reason for that was because the jobs were so small——

Q. (Interposing.) Was there or was there not?

Mr. MILDE. Let him continue his answer.

The WITNESS. And we didn't feel that the amount involved would warrant the time it would take to calculate this interest.

By Mr. SLAFF:

Q. Well, regardless of your emotions in the matter, Mr. Antonelli, were there or were there not costs for interest during construction of the Hope property on jobs of less
5600 than $5,000?

A. No, sir; there were not, and I would like to qualify my statement and tell you why.

Q. Well, let me understand. You are telling us that those costs did not exist; is that right?

A. The costs did exist but we didn't bother showing them.

Q. I realize that you didn't show them, but I am asking you whether or not the costs for interest did exist on jobs that cost less than $5,000 to Hope?

Mr. MILDE. I object; he has just answered that question.

Mr. SLAFF. He started to answer it.

TRIAL EXAMINER. If I understood it right, he didn't answer it as he intended to.

Mr. MILDE. Maybe not.

TRIAL EXAMINER. If I am not mistaken, he has two answers to the question already.

Mr. SLAFF. The answer has been both ways now, and I would like to have a majority opinion from the witness.

Mr. MILDE. I don't think it has been answered both ways.

Mr. SLAFF. Well, suppose you tell us whether or not on jobs that cost less than $5,000 in the Hope system there was a cost for interest incurred by Hope?

5601 The WITNESS. We are referring now to my original cost?

By Mr. SLAFF:

Q. No; was there in the history of the Hope Company, on jobs that cost less than $5,000, a cost to Hope for interest?

A. There must have been; somebody furnished the money.

Q. All right. And your exhibit does not show that; is that correct?

A. Yes, sir; and I explained why.

5602 Q. That is right. So that, to that extent at least, your exhibit does not show, in your own eyes, the actual cost of the Hope properties; isn't that correct?

A. Well, we did that on account——

Q. (Interposing.) No, no; is it or is it not correct, Mr. Antonelli?

The WITNESS. Read the question, please.

(The question was read.)

The WITNESS. It does not show the interest for properties constructed taking less than one month or costing less than $5,000.

By Mr. SLAFF:

Q. Mr. Antonelli, you told me in the hypothetical case I gave you that $2,500 was not the actual cost of the property constructed to Utility A, did you not?

A. Yes.

Q. Now I am asking you——

A. (Interposing.) That was a hypothetical question you were asking.

Q. Why, of course.

A. All right.

Q. And I am asking you if, on the basis on which you answered that question, it is not a fact that your Exhibit in this case does not show the actual cost of the Hope 5603 Company properties?

A. I say that it does show the actual cost of the Hope Company properties, and the only reason that we did not show the interest on properties constructed, in less than 30 days and costing less than $5,000 was from a practical standpoint it would have taken a great deal of time to determine that amount and to calculate it. It didn't amount to very much. That is why we left it out. It is just a conservative answer.

Q. So that your determination of actual cost of the Hope Company properties depended, to this extent at least, on the choice which you made with respect to a matter of accounting discretion, did it not?

A. No, sir; no accounting discretion came into the picture.

Q. Tell me this. Was it a matter of accounting discretion as to whether you would take jobs costing $5,000 and taking 30 days or more to construct, or jobs costing $6,000 or $7,500, and taking the same time to construct?

A. Well, I confined myself to the $5,000 jobs, because I thought that would give about the best results.

Q. Wasn't that a matter of discretion as to which amount you would take, and what period you would take as a basis for capitalizing interest during construction?

A. I didn't capitalize any interst during construction, I just determined the original cost and could have used——

5604 Mr. SLAFF (Interposing). Mr. Examiner——

Mr. MILDE (Interposing). Let him continue.

Mr. SLAFF. Go ahead.

The WITNESS. I could have started with a dollar and I could have started with something else, but in my estimation I thought that $5,000 and the one-month period were about the best basis to use.

By Mr. SLAFF:

Q. And that was a matter of choice with you, of discretion with you, was it not?

A. A matter of judgment; yes.

Q. And that matter of judgment involved a matter of essentially accounting judgment, how the transaction should be accounted for, did it not?

A. No, sir.

Q. Is the computation of interest during construction in the utility industry an accounting matter, Mr. Antonelli?

A. I don't know.

Q. Do you know anything about the operation of natural gas companies, Mr. Antonelli?

A. No; I am an engineer; no, I don't, as to the operations. I don't know just exactly what you mean by "operations." Let me get that straight.

Q. Do you know anything at all about the office operations of a natural gas company?

5605 A. Well, I have been around them.

Q. I mean, besides going through and saying "hello" to the boys?

A. I worked right in the company's offices; yes, sir.

Q. Now don't you know that the determination of the amounts to be charged as interest during construction in the routine operation of a natural gas company is a matter of accounting judgment?

A. Well, it might be, but that is not the way I did it.

Q. I think we are entirely convinced, Mr. Antonelli, that that is not the way you did it.

* * *

5606 By Mr. SLAFF:

Q. Now then, Mr. Antonelli, don't you know that it is a matter of accounting judgment or discretion to determine what

basis shall be used for the capitalizing of interest during construction?

A. Companies do that, I don't deny, but in this case——

Q. (Interposing.) You don't do it, we know.

A. I followed my judgment.

Q. We know that. Well, go ahead, have you got something more to add?

A. And we used this $5,000 and 30 days and 6 percent, after a study as to interest rates on the construction done by Hope.

Q. So that it is a fact, Mr. Antonelli, is it, that your determination of original cost, in this respect, at least, depended upon the discretion which you exercised with respect to an accounting matter? Now that is so, isn't it?

A. No, sir.

Q. You did exercise a discretion with respect to the basis for capitalizing interest during construction, did you not?

A. I just found the additional——

5607 Q. (Interposing.) No, no, ——

A. (Interposing.) I didn't capitalize anything, Mr. Slaff. I determined the original cost, and the company did spend some money for interest, and in order to get the actual cost I did my best and added to the original cost the amount of money that was necessary for interest. That was an estimated figure.

Q. Now, Mr. Antonelli, are you telling us that in your determination of original cost, you did not capitalize interest during construction?

A. I didn't capitalize anything, I didn't do a bookkeeping job; I determined the original cost of these properties. I didn't say that the amounts were capitalized or expensed or what-not, I determined the original cost.

Q. Did you capitalize anything in your determination of original cost?

A. No, sir; I found how much this property cost as of December 31, 1938, to the Hope Company in the case of the property constructed by Hope, and its original cost in the case of property constructed by other utilities. That is all I did.

Q. All right. As the basis for determining how much should be included therein for interest during construction, you did use your discretion, did you not?

5608 A. Yes; after a long study; yes, sir.

Q. And you have told us, have you not, that the basis of determining what amounts shall be added for interest during

construction, in the operations of a natural gas company, i
an accounting matter; isn't that correct, and isn't that wha
you have told us?

A. As I said before——

Q. (Interposing.) No; isn't that correct?

A. I don't know if it is an accounting matter or whatnot;
wasn't interested in that.

Q. Now then, are you telling us now that you don't know
whether it is an accounting matter, in the operations of a natura
gas company, to determine the basis upon which interest during
construction shall be added to other costs?

Mr. MILDE. May I have that question read, please?

(The question was read.)

The WITNESS. Maybe it is, maybe it isn't.

By Mr. SLAFF:

Q. You don't know; are you telling us that you don't know
whether it is or not?

A. Well, maybe it is; yes.

Q. No, no, Mr. Antonelli. Do you or don't you know whether
it is?

* * *

5609 The WITNESS. I think it is an accounting matter.

By Mr. SLAFF:

Q. So then, Mr. Antonelli, isn't it a fair statement to say tha
in this respect, at least, your determination of that part of orig
inal cost depended upon your discretion with respect to a matte
that is an accounting matter in the normal operations of a natura
gas company; isn't that a fair statement, Mr. Antonelli?

A. It wasn't an accounting matter as far as deciding to use 6
percent; no, sir. In case I bought a house I have to pay 6 per
cent interest, that isn't an accounting matter with me.

Q. Well, I am referring to the fact that you used a specific
basis of 30 days and $5,000 or more.

A. Yes; that was engineering judgment. We do that ever
in other jobs; we do it in reproduction cost jobs.

Q. So then, you are telling us that in that particular respect
your original cost determination did not in any way depend upon
the exercise of your discretion with respect to a matter which is
an accounting matter in the normal operations of a natural gas
company?

* * *

5610 The WITNESS. I don't understand the question the way you have it there.

By Mr. SLAFF:

Q. What part of it don't you understand?

A. Will you break it up, please, into a couple of parts, and I may be able to answer it.

Q. It is a simple question; it is one question.

TRIAL EXAMINER. Read the question again, please?

Mr. MILDE. I challenge counsel to restate it

Mr. STAFF. I can restate it, but I don't choose to at this moment.

(The question was read by the reporter.)

The WITNESS. It is not clear to me.

By Mr. SLAFF:

Q. All right. Are you telling us, Mr. Antonelli, that in no way did your original cost determination depend upon the exercise of discretion with respect to accounting matters?

A. Yes, sir, I do; I did not pay any attention to accounting principles and practices of the Company.

Q. Now confining ourselves strictly to the amount of interest during construction included in your original cost determination, will you tell us whether, in that respect, the

5611 amount of interest during construction that was used depended in any way upon the exercise of your judgement, your discretion, with respect to a matter that is an accounting matter in the normal operations of a natural gas company?

Mr. MILDE. I object to that question. It is an inaccurate statement——

Mr. SLAFF (interposing). It is not supposed to be a statement; it is a question.

TRIAL EXAMINER. I don't understand it to be a statement of anything. Do you understand the question?

The WITNESS. Well, as I make it out, he is referring to this 6 percent that I am using; is it a matter of accounting principle?

TRIAL EXAMINER. The 6 percent?

The WITNESS. The interest that I used was a matter of accounting principle.

By Mr. SLAFF:

Q. As a matter of fact, as I have told you, Mr. Antonelli, I am referring more specifically to the basis, that is, the 30-day and $5,000 basis that you used. In the light of that statement of mine, can you answer the question?

A. Well, I still say that the 30 days and the judgment the way we calculate interest, was based on studies made and
5612 not on any accounting practices or principles.

Q. The 6 percent was based on studies, you mean?

A. The 6 percent, yes; and the time was a matter of convenience, for me to do it.

Q. That is, the 30 days and the $5,000 basis; that was a matter of convenience to you?

A. Yes.

Q. Now another engineer, equally competent to you, could have used another basis, could he not, as a matter of convenience; that is to say, let us say 45 days and $7,500; and be just as reasonable as you?

A. Yes, sir; he could have.

Q. Then he would have arrived at a different actual cost of the properties of the Hope Natural Gas Company, would he not, from the one you arrived at?

A. Yes; but this interest is not such a large amount, you know.

Q. Well, let's not worry about the size of the amount, Mr. Antonelli, at this moment.

* * *

The WITNESS. Well, I would like to say that this interest is not such a large amount that it will have any effect on the actual cost. After all, you know there were some estimates made
5613 in here, and to that extent maybe this actual cost is off a few dollars.

By Mr. SLAFF:

Q. Well, you realize, Mr. Antonelli, that we are discussing here the principles that underlay your determination? You understand that?

A. I do.

Q. Now it is a fact, then, that there is not merely one actual cost, in your own view, isn't that so?

A. There is only one actual cost. There couldn't be anything else but one actual cost.

Q. Well, then, at least you did not necessarily determine correctly that one actual cost, is that right?

A. I determined it as accurately as I could get it; yes.

Q. And another person, using the same methods but different discretion, and exercising his judgment in different ways on matters of discretion, could arrive at another statement of actual cost which might be equally reasonable with yours; is that correct?

A. Yes; and I would say that when we determined our actual cost, we stated the conditions under which we determined it. We said that in case of interest we allowed interest for properties $5,000 and over, and taking 30 days to construct.

Q. By the way, who made that determination; was that the engineers or the accountants?

5614 As far as each one of the component parts, what about the interest, who determined that 6 percent was the proper rate of interest to use?

A. Well, that was determined after a long study as to the various interest rates paid during the history of the company, and we found out that 6 percent was about the normal interest paid.

Q. Who made the study?

A. One of our men; I just couldn't recall now.

Q. Do you have any work papers on that study?

A. I will have to refer to my working papers and see.

Q. Will you report to us whether you do or do not have any such working papers?

A. Yes, sir.

TRIAL EXAMINER. That was an engineering study, you say?

The WITNESS. It was just a study. We analyzed the interest paid in the various years, and what was the normal interest paid for that type of work way back from 1900 up to date.

Mr. REEDER. Mr. Antonelli, just to refresh my recollection, didn't you tell me in chief——

Mr. MILDE (interposing). Is this cross-examination, Mr. Reeder?

Mr. REEDER. No; this is just to refresh my recollection. Mr. Antonelli, didn't you tell me in chief that you based

5615 your interest during construction, of 6 percent, simply on the legal rate of interest in West Virginia?

The WITNESS. I don't recall offhand, Mr. Reeder, but I believe that 6 percent is the legal rate of interest in West Virginia.

By Mr. SLAFF:

Q. Well, will you check, Mr. Antonelli, and come back and tell us whether a study was made on which you based this 6 percent, and if it was, whether you have any working papers or not, or whether it is not a fact that you testified that you based your 6 percent rate on the legal rate of interest in West Virginia?

A. Yes, sir.

Mr. MILDE. Well, I submit that the only thing he has to report on is whether or not he has his working papers. He has testified

that he made the study, and whatever he said in the record before is already in the record. So the only thing he has to report on is whether or not he has working papers on this study.

Mr. SLAFF. It is all right with me, but I am suggesting for Mr. Antonelli's convenience on the witness stand that he refresh his recollection as to whether he testified in that respect.

By Mr. SLAFF:

Q. Now we made inquiry of you the other day, Mr. An-
5616 tonelli as to whether Ford, Bacon & Davis had developed certain unit costs in the 1929 Hope valuation proceedings, and whether or not you used those unit costs in connection with your original costs estimates. Have you made such an investigation?

A. Ford, Bacon & Davis did develop unit costs in their valuation of the Hope properties as of 1929, but those costs were not used or performances were not used in connection with my determination of the original costs of Hope's properties.

Q. They were not used at all?

A. No, sir; they were not.

Q. For what purpose did Ford, Bacon & Davis make those determinations?

Mr. MILDE. I object. That has no relevancy to this case.

Mr. SLAFF. Well, he testified that Ford, Bacon & Davis developed certain unit costs or performances on the Hope properties.

Mr. MILDE. In 1929.

Mr. SLAFF. That is right. I want to find out for what purpose those were made, what was the basis for making them, and then I want to find out why he didn't use them here.

TRIAL EXAMINER. The objection is overruled.

Mr. MILDE. Note an exception.

The WITNESS. They were prepared for the purpose of
5617 determining the properties of the Hope Company as of that date.

By Mr. SLAFF:

Q. For determining the properties, you say?

A. The cost of the properties.

Q. And those were determinations based on the best knowledge and information and judgment of Ford, Bacon & Davis as of that time, of performance in construcing Hope properties; is that correct?

A. Yes, sir.

Q. And what did that study embrace?

A. What study?

Q. That Ford, Bacon & Davis made of performances on the Hope system?

A. Well, they just developed unit costs.

Q. Well, did they make a study of performances of labor in the Hope system?

A. Well, I can't answer that question, I didn't make that study then.

Q. Did you determine, Mr. Antonelli, at any time, in connection with this present study you have been making for the last several years, what Ford, Bacon & Davis did in that 1929 determination?

A. Other people worked on that job; I didn't.

Mr. SLAFF. Mr. Examiner, will you please instruct the witness to answer the question?

5618 TRIAL EXAMINER. Answer the question.

* * *

The WITNESS. Determination of what?

By Mr. SLAFF:

Q. O. K. Mr. Antonelli, you have testified that Ford, Bacon & Davis made certain labor performance determinations in connection with their 1929 valuation of the Hope property; is that right?

A. Are we referring now to structures?

Q. I am referring to anything in the Hope system.

A. As far as I can see, they did make studies, yes, sir; they must have made studies in order to price the properties as of that date, because that is the way we do our work.

Q. Now at any time in connection with your original cost study in this proceeding, up to this proceeding, did you investigate the records of your firm to determine what had been done by Ford, Bacon & Davis with respect to the determination of such performance units in the 1929 valuation?

A. No, sir; I didn't, but I believe that I applied the 1927 or 1929 unit costs that were developed by Ford, Bacon & Davis at those dates, to these three compressing stations that I used to equalize the Ford, Bacon & Davis performances with the actual Hope performances.

5619 Q. Mr. Antonelli, you told us on the witness stand the other day that the units of performance that you have used in connection with these three compressor stations to get your

ultimate performance in this case, came from records of Ford, Bacon & Davis covering a wide sweep of jobs, didn't you?

Mr. MILDE. I object, that wasn't his testimony.

The WITNESS. I never said anything like that.

By Mr. SLAFF:

Q. Didn't you emphasize, Mr. Antonelli, that the unit costs with which you compared these three compressor stations came from many jobs?

A. I said——

Q. (Interposing.) Did you or did you not?

A. I did not. I said it was based on studies made by Ford, Bacon & Davis.

Q. Of many jobs?

A. Yes, sir; based on their experience, I said.

5620 Q. And did you at any time, Mr. Antonelli, in that discussion of how you developed your labor performance rates in this case, tell us that you had added 25 per cent to performance rates developed by Ford, Bacon & Davis in connection with the Hope Natural Gas Company?

A. I said——

Q. (Interposing.) Did you or did you not tell us at any time in that testimony?

Mr. MILDE. Well, I object to that type of question.

Mr. SLAFF. It is a perfectly proper question.

Mr. MILDE. "Did you tell us at any time" upon cross-examination? Mr. Antonelli hasn't charge of the cross-examination.

Mr. SLAFF. And he hasn't answered in the cross-examination in my judgment truthfully in that respect, and I use that word advisedly.

TRIAL EXAMINER. Will you read the question?

(The question was read.)

TRIAL EXAMINER. Objection is overruled.

Mr. MILDE. Note an exception.

The WITNESS. I added 25 per cent to the cost——

TRIAL EXAMINER (interposing). No; he asked you whether or not you told him that. Do you understand? He isn't asking you what you did; he is asking you what you testified to.

The WITNESS. I testified that I added 25 per cent to the 5621 unit costs developed, based on Ford, Bacon & Davis performances, and that is a truthful statement and I never made anything but a truthful statement here.

* * *

5647 Q. And did the Hope Company receive a copy of those performances that were developed by Ford, Bacon & Davis, in connection with their 1929 valuation and keep them in its files —the Hope Company's?

A. No; I don't think so.

Q. Now, Mr. Antonelli, with respect to your Exhibit 60, will you be good enough, for the moment, to turn—will you turn specifically for the moment to the account 372 at pages 421 and 423?

A. Yes, sir.

Q. Dealing with office furniture and equipment?

A. All right.

Q. Now, were all the items set out at pages 421 to 423 expensed by the company in the past?

A. It was impossible for me to find if all of these items were expensed, because some of these items I could not identify. There is a possibility that some of these items were capitalized, but there was no way for me to find them on the company books. The description wasn't sufficiently clear.

Q. Did you say there was a possibility that some of these books had been capitalized?

A. I am not referring to the books, I am referring to the cabinets and so on.

Q. Well, then, if any of those were capitalized on the company's books to that extent, there is duplication.

5648 A. Oh, no. There isn't duplication. If this was on the books and I wasn't able to identify it, I left it out. I didn't take anything on the books that I couldn't identify. I prepared an inventory in the field and then reconciled it to the books, and if I didn't find the item and I wasn't sure that is the item excluded, I didn't use it.

Q. Well, if any of these were not on the books, what adjustment did you make in the account, or did you estimate the entire account?

A. If I didn't find it on the books I excluded it and didn't use it at all.

Q. Now, with respect, for a moment, to the law book costs which you shown on there, totaling, I think—oh, well, whatever it does total?

A. It is about $14,000.

Q. Yes. Where were those costs charged in the past?

A. They were charged to operation.

Q. To an operating expense account; is that correct?

A. Yes, sir.

Q. And does the company still continue that practice?

A. I don't know.

Q. Now, assume that the company does still continue that practice, Mr. Antonelli, of expensing law books purchased and you were bringing your inventory down to June 30, 1941, the
5649 law books have been purchased between the date of your estimate and June 30, 1941, would you include in the cost of the property brought down to June 30, 1941, the cost of the books purchased between December 31, 1938, and June 30, 1941?

A. If I were determining the actual, original cost of these properties, regardless of what the company is doing on their books; yes, I would.

Q. Then your answer to my question is yes; is that correct?

A. Yes. I——

Q. (Interposing.) If you are bringing your original cost determination down to June 30, 1941, you would include within the original cost the amounts that had been expensed by the company from January 1, 1939 to June 30, 1941 for law books, and charge to operating expense; is that correct?

Mr. MILDE. If they still exist in 1941?

Mr. SLAFF. Certainly.

A. Yes; if I were determining the original cost as of that date I would include them; yes, sir.

By Mr. SLAFF:

Q. And that you would do under the prevailing system of accounts, to wit: The West Virginia System of Accounts and the Federal Power Commission System of Accounts, applicable to the Hope Natural Gas Company?

A. I didn't say anything about the accounts now. You
5650 asked me if I would bring in the original cost—my original cost. Now in the prevailing accounts that is something else.

Q. Well, I mean, you realize that the West Virginia System of Accounts has been effective since January 1, 1939, and the Federal Power Commission System of Accounts has been effective since January 1, 1940; you realize that?

A. Yes, I do and——

Q. (Interposing.) And you answered——

Mr. MILDE (interposing). Has he finished——

Mr. SLAFF (interposing). Well——

The WITNESS (interposing). Go ahead.

By Mr. STAFF:

Q. (Continuing.) And you made your previous answer in the light of that knowledge and realization?

A. Yes, I did, but at the same time, as I said before, you asked me to bring this original cost up to date for the purpose of determining the complete costs of the properties. Now, I wasn't speaking or referring to any accounting methods that the company is following or the way they are going to set up their books after 1939 and so on. I was referring to the original cost of the property in order to determine the complete cost of this property.

Q. So, just as you disregarded the accounting of the company, pursuant to previously controlling systems of accounts, so, too, you would in that respect disregard the presently
5651 existing systems of accounts; is that correct?

A. Well, I wasn't doing an accounting job, Mr. Staff.

Q. No, no. Can you answer the question, Mr. Antonelli?

A. I am answering it. I say that I wasn't doing an accounting job. I was just determining the original cost of these properties, that is all. This is not a bookkeeping job where you have to show the amount on the books and how much you capitalized and how much you are going to set up in an account, 107 or 100–5 and so on. This is just supposed to show what is the original cost of the Hope properties and you asked me to bring it up to a later date, and I said that I will include all of the items regardless of the expense capitalized to the company as of any date that you wish me to do so.

Q. Yes. So that the fact that the presently existing systems of accounts were not in effect as of December 31, 1938; that makes no difference in your method and in your approach?

A. Not as far as determining the actual original cost of these properties is concerned; no, sir.

Q. You think it is entirely proper, of course, I assume, to expense an item during one year and to charge it as part of the capitalized original cost of the company at the end of that year also; is that correct?

Mr. MILDE: There is no testimony to that effect and if
5652 that is supposed to be a summarization of his testimony, it is inaccurate.

Mr. STAFF. I am asking him. He can tell me if it is inaccurate or an unfair summarization.

TRIAL EXAMINER. Objection is overruled.

The WITNESS. That is an accounting problem. As I stated before, I didn't try to set up the company books. I didn't care if it was expensed or if it was capitalized. I said it so many times. I just determined the original cost of these properties. That was my problem.

Mr. SLAFF. May I have the question, please?

TRIAL EXAMINER. Read the question.

(Whereupon, the pending question, as above recorded, was read by the reporter.)

A. I don't know if it is proper or improper. That is an accounting problem.

By Mr. SLAFF:

Q. I am asking you whether you consider it proper, Mr. Antonelli?

A. I didn't have to consider it.

Q. I am asking you to consider it right now and tell me whether you consider it proper or not?

Mr. MILDE. Well, I object to that. That isn't proper examination of Mr. Antonelli.

Mr. SLAFF. Do you want the record to note that I was frowning at the witness at that moment, too?

5653 Mr. MILDE. No, I didn't suggest that. You usually smile at him.

Mr. SLAFF. Of course it is thoroughly proper cross-examination to go into the basis of the theories upon which he predicated his original cost.

Mr. MILDE. Not at all. This is an accounting question and this witness has said over and over again that he isn't an accountant, he is an engineer, and this is purely a cross-examination directed to test a man's accounting knowledge or his approach to accounting problems, and Mr. Antonelli hasn't been presented in that light, and he isn't an accountant, and this has nothing to do with his testimony whatsoever.

TRIAL EXAMINER. Well, it seems to me that the witness has gone somewhat beyond engineering matters in determining the original cost in this case. He hasn't qualified as an accountant, I don't believe.

Mr. SLAFF. I certainly agree with that last statement of the Examiner's wholeheartedly.

Mr. MILDE. Well, I don't think that is quite accurate except to this extent: That he had to set up these properties in accordance with the classification as prescribed in the code of accounts. The

purpose of that was so that we could use his work in our books when the time came, when we had to reclassify and determine the original cost of our properties in accordance with the code.

5654 What he has done is determine the original cost, that is what the properties actually cost and then he has reclassified it in accordance with the method of classification prescribed in the code of accounts, but I think that is as far as he has gone into the accounting field, if that really is an accounting field.

TRIAL EXAMINER. Well, it seems to me that a study of these vouchers and all that kind of stuff is accounting, certainly to a great extent. He has had to make lots of determinations, I would imagine, that were beyond the field of engineering. As a matter of fact, the witness was qualified, was he not, as a valuation expert?

Mr. SLAFF. Yes.

TRIAL EXAMINER. Including costs?

Mr. MILDE. I think that is right. He has worked on valuations for a good many years. My objection to this question was that it is purely an accounting question.

TRIAL EXAMINER. Well, I am inclined to agree with you so far as that is concerned. I am also inclined to the view that his opinion with respect to the matter isn't going to make a great deal of difference anyway.

Mr. MILDE. I think that is right.

Mr. SLAFF. Well, that may be so, but I think it is very illuminating as to his entire approach and as to the entire approach to the company.

5655 TRIAL EXAMINER. Objection is overruled. Answer the question.

Mr. MILDE. Note an exception.

* * *

A. Well, nobody has capitalized it one year and expensed it the other year. The company did not do that. They expensed it prior to 1939 and are still expensing it.

* * *

TRIAL EXAMINER. Mr. Slaff just wants to know what you think about that.

The WITNESS. Well, it all depends on the policies of the company. It depends on what the items are and I just don't know how to answer the question, if it is proper or it isn't proper.

* * *

By Mr. SLAFF:

Q. Well, with respect to specific items that we were discussing a few minutes ago—law book, for example—do you consider it proper for the company to expense the cost of those books
5656 during the year and at the end of the current year to include those same costs as part of the capitalized original cost of the company's property?

* * *

The WITNESS. Are you talking about the same year now or ——

By Mr. SLAFF:

Q. (Interposing.) That is right.

A. Will you give me an example?

Q. Sure.

A. All right.

Q. Bringing your inventory down to January 1, 1940, the company during the year 1939 expensed $1,000 for law books and charged it to expenses?

A. Yes.

Q. Now, do you consider it proper for the company, at the end of that year, to include those expenses as part of the capitalized original cost of its property?

A. Well, it might be during that year that the company thought the items should be an expense and at the end of the year they thought they had made an error or something like that.

Q. No; there is no question of error. They properly expensed them under the controlling system of accounts.

A. That still depends on the policy of the company.

5657 Q. Well, I have given you the policy of the company, Mr. Antonelli, and I want you to tell me whether you think that that is proper action?

Mr. MILDE. Well, I object to the question. Proper under what? Is it in accordance with some code of accounts or according to——

Mr. SLAFF (interposing). Any way he wants to look at it. Code of accounts, code of ethics—any code he has.

The WITNESS. Under the code of accounts, if the company has decided that this item should be expensed, I would say that it would be improper to capitalize it.

By Mr. SLAFF:

Q. I see. Then I understand your present testimony to mean that you consider it improper to capitalize items which have

previously been expensed by the company exercising its discretion under a controlling system of accounts, is that correct? (Objection overruled.)

* * *

5658 A. Yes, sir.

By Mr. SLAFF:

Q. And that applies, of course, not only to the specific account that we were discussing, but throughout?

Mr. MILDE. Same objection.

By Mr. SLAFF:

Q. I mean, you weren't confining that to a specific account, were you?

Mr. MILDE. Same objection.

TRIAL EXAMINER. Objection overruled.

A. No, sir.

* * *

6250 PETER ANTONELLI was recalled as a witness, having been previously sworn, was further examined and testified as follows:

Cross-examination by Mr. SLAFF:

Q. Mr. Antonelli, one of the matters we were discussing the other day was what the basis for your use of 6 per cent as the rate which you used for interest during construction was. Do you remember that?

A. Yes, sir; I do.

Q. And it is a fact, is it not, that you used 6 per-cent for interest during construction as being the legal rate of interest in the State of West Virginia?

A. Yes, sir.

Q. And that determination of 6 percent as the interest rate was upon that basis and not upon any study of cost of money to the Hope Company in the past; is that correct?

A. I looked over my papers and I find that the legal department of Hope was instructed to make a study as to the various rates, and what was the legal rate in West Virginia, and that is what I had in mind when I said that there was a study made up.

6251 Q. Yes, but the study was, as you have just testified of the legal rate of interest, statutory rate of interest in West Virginia, and not of any cost of money expense of the Hope Company; is that correct?

A. That is correct.

Q. As a matter of fact, construction by the Hope Company was financed primarily out of its own funds, isn't that so?

A. I don't know how they were financed.

Q. You just——

A. [Interposing]. I never had occasion to find out.

Q. I see. Now, with respect to your testimony that many of the items contained in Exhibit 60 were inventory adjustments, you recollect that testimony, do you not?

A. Yes, sir.

Q. Did you have in your Exhibit 20 a statement of the inventory adjustments contained in column 6 of Statement "B," page 31; is that right?

A. Yes, sir.

Q. And you furnished, did you not—and the net amount of the inventory adjustments was a red figure of $1,804,000, is that not correct?

A. That is correct. As far as property constructed by the company is concerned, and property purchased from non-
6252 utilities or from utilities where not an operating unit of the system, yes; that is correct.

Q. Now, you furnished, did you not, to the Commission's staff, a breakdown of that figure, showing the total gross debits, and the total gross credits involved?

A. I recall furnishing a statement of that type; yes, sir. I just can't picture it now, what it looks like, but——

Q. [Interposing.] Well, will you examine those sheets which I hand you [handing]; and ask you if that is the breakdown which you furnished the Commission staff?

A. Yes, sir.

Q. And those contain—those show, do they not, a total of—strike that. What amount do they show as debit, and what amount as total credit figures?

A. It shows as debit figure $4,383,474.28, and as credit $6,187,867.76.

Q. Leaving the net credit of $1,804,000 shown in your Exhibit 20; is that correct?

A. Yes, sir; as far as property constructed by the Hope Company is concerned, or purchased from nonutilities.

Q. The debit amount of four million odd represents properties, cost of properties, which you have added to the capitalized cost.

the book cost, of the Hope Company properties; is that right?

6253 A. No; that is only a correction to the company records, a property that was found on the company—I mean, that were on the company books but not found in the field. Now, properties that were found in the field and not found on the books, they came under direct material and labor cost, not capitalized cost.

Q. [Interposing.] What does the debit amount of four million odd represent?

A. That represents adjustments of all kinds that were made on the company records. It isn't only an inventory adjustment now.

Q. But that does include inventory adjustments, does it not?

A. Yes, is does.

Q. And the total debit figure, including those inventory adjustments, is, as you stated, some four million dollars odd; is that correct?

A. Just a moment. Yes, it does. The inventory adjustment is only $406,000 out of it.

Q. In addition to those inventory adjustments, however, as I understand your position now, after your testimony of July 7, there are still additional inventory adjustments to be made; is that correct?

A. I would like to make an explanation in connection with the previous question. This $4,000,000 debit is made
6254 up of all kinds of debits. You understand that. The adjustments that were made are as follows: Elimination, depreciation capitalized on property purchased, inventory adjustments, transfers from and to utility plant in service accounts, transfers to other accounts.

TRIAL EXAMINER. They are all debit items?

The WITNESS. That is right. I want to make sure that that is not all inventory adjustment of four million dollars.

By Mr. SLAFF:

Q. Have you completed your answer?

A. Elimination of capitalized unproductive deeper drilling, elimination of arbitrary rig charges, other kinds of adjustments and miscellaneous adjustments, and so on. I want to make that clear before we go ahead.

Q. Yes, of course. All those adjustments are developed from the inventory which you made of the property of the Hope Company; that is correct, is it not?

A. All of those adjustments are adjustments made to the company books.

Mr. SLAFF. Will you please repeat my question?

(Whereupon, the pending question, as above recorded, was read by the reporter.)

A. No; that is not correct.

6255 By Mr. SLAFF:

Q. Well, why did you change the books? What was there that led you to change the figures stated on the books?

A. Well, we reconciled the books with an inventory that was made in the field.

Q. All right.

A. I am not done yet.

Q. Go right ahead.

A. And the amount that is reflected in this $4,000,000 is a correction to the books.

Q. Certainly.

A. To that there were other inventory adjustments which were not included in the company books, and which were included by me on these direct material and labor costs not previously capitalized.

TRIAL EXAMINER. These adjustments were made then in order to reconcile the books with the inventory; isn't that correct.

A. As far as we can do it from the books, but there were other inventory adjustments. For instance, we went out to the field, we might have have found a house, and that house was not shown on the company books, not included in any place in the company books. Therefore I included it under the direct material and labor costs. It is included in that Exhibit 60 that we have been talking about

6256 By Mr. SLAFF:

Q. Mr. Antonelli, do you have any such type of cost included in your inventory adjustments in column 6 of Exhibit 20, as you have just stated to the Examiner?

A. What type of ——

Q. Property which you found out in the field which did not appear on the books. You have such adjustments in the totals included in column 6 of Exhibit 20, don't you?

A. I might have some that I was certain that the company capitalized; yes.

Q. Yes, well, then ——

A. [Interposing.] I might. I don't know. I would have to search in my items to find them. I can't tell you offhand. There must be some.

Q. If it wasn't on the books, Mr. Antonelli, how was it capitalized?

A. I will tell you an example of that.

Q. Yes.

A. For instance, in a compressing station, we found a pump in the field and it was not found on the books. However, on the books we found a pump with another serial number. We weren't sure that was the pump that we were talking about and, inasmuch as the policy of the company has always been to capitalize pumps (we never found a pump expensed) we
6257 did include the pump in this adjustment column as a correction to the books. That is the only kind of examples that were included under the adjustment column.

TRIAL EXAMINER. Didn't you assume that that pump had already been capitalized?

The WITNESS. No, because—yes; but inasmuch as we didn't know what pump it was we eliminated—we included in our inventory everything that we were able to say a hundred percent that that was the item. Now, we eliminated from the books all items that we couldn't a hundred percent tie down to serial numbers or something like that.

Mr. MILDE. In that illustration, Mr. Antonelli, you would write out in the books a pump without a serial number?

The WITNESS. Yes.

Mr. MILDE. At whatever cost it was?

The WITNESS. That is right. And substitute this one that I found out in the field.

Mr. MILDE. With whatever its voucher cost was?

The WITNESS. That is right. No duplication or ——

TRIAL EXAMINER [Interposing]. All right.

By Mr. SLAFF:

Q. So you did, of course, deem it important in your determination of original cost to make a careful study of the com-
6258 pany's prior practices with respect to either capitalizing or expensing items of property, did you not?

A. Well, to that extent, yes. I made a study and I did find that in case of pumps or items of that type, the company always did capitalize those items. That was part of my study.

Q. Yes; then we are in agreement, are we, Mr. Antonelli, or tell me whether we are, that in determining the original cost of a natural gas company's property, it is important to make a determination in advance of what has been the company's policy and practice with respect to expensing or capitalizing items of property?

A. Well, it did not make any difference to me as far as determining original cost. The only thing that I was very much concerned about was that I show the picture very clearly. If the company capitalized the items, we put them under the capitalized cost. If we couldn't find it, then we show it under cost not previously capitalized, or under direct material and labor cost not capitalized by the company books. That was just a matter of setting the cost at each proper column. I could have done if the other way; show one total.

6259 Q. Well, Mr. Antonelli, you didn't make that determination just for the sake of making it, did you?

A. Oh, no ——

Q. [Interposing]. You had a purpose?

A. I had a purpose and the main purpose was that when in the future the company set up their continuing property records, they could utilize all my working papers to the best advantage.

Q. And what is more, in your judgment, you couldn't come to a proper determination of original cost, according to your own lights, without making such a determination of the company's policy in the past; isn't that correct?

A. What policy are you referring to?

Q. Whether particular items were to be expensed or capitalized.

A. Well, If I found that the company had always capitalized——

Q. [Interposing]. I wonder if you can answer the question!

A. I am trying to answer it.

TRIAL EXAMINER. Read the question, please.

(The question was read by the reporter.)

TRIAL EXAMINER. You can answer that "yes" or "no," can't you.

The WITNESS. Yes; I did make a study to find out what
6260 items were capitalized and what were expensed.

By Mr. SLAFF:

Q. And the reason that you made that study, Mr. Antonelli, was, was it not, that you could not come, in your own judgment, to a proper determination of the original cost of this company's property without making such a study?

A. No, sir; that didn't have anything to do with my reasoning. As I said before, the reason that I did it that way was to prepare the ground for the company to set up their books in accordance with the new code of accounts.

Q. What were they supposed to set up on their books in accordance with the system of accounts?

A. In accordance with the system of accounts they were supposed to show the adjustment—in other words, the difference between the book cost and the original cost of property constructed by the company in Account 107, Plant Adjustment.

Q. So you had to make this determination of the company's policy as to capitalizing or expensing items in the past in order that the company could properly set up on its books the original cost of its properties; isn't that right?

A. Well, I don't know that; the company set up their books in accordance with the new code of accounts.

Q. Well, can't you answer the question just as I have put it, Mr. Antonelli?

6261 Mr. MILDE. Well, I submit he has answered all the questions fully, and just because you slip in a few different phrases doesn't change the answer in the slightest.

Mr. SLAFF. I don't want him to change his answer; he can stick by his guns as long as he wants to, as long as he thinks his guns are right. I don't want him to change a thing, but I think he can answer the question directly.

TRIAL EXAMINER. Read the question.

(The question was read by the reporter.)

Mr. SLAFF. The question is susceptible of a direct categorical answer.

TRIAL EXAMINER. They couldn't have set them up in that manner except on the basis of your study, could they?

The WITNESS. Yes; on the basis of my study they could set up their books in accordance with the new code of accounts; yes.

By Mr. SLAFF:

Q. And in accordance with that system of accounts, show the original cost of their property; isn't that correct?

A. Well, I will have to explain that a little bit. This continuing property record, or the new books, will show in one column the original cost and in another column it will show the book cost; and in another column it will show the amount that has been previously capitalized. It shows all of those three amounts. It will show the book cost, it will show the items
6262 not previously capitalized, and it will show the original cost. It will also show the adjustment, the 107 adjustment, and it will show the 100.5 adjustment, the Plant Acquisition Adjustment.

Q. Well, I don't know that that explanation was called for by the question, but I am glad to have it on the record. Now, I would like to have the question answered, and I will repeat it for you, Mr. Antonelli. Isn't it a fact that you had to make a determination of the company's policy in the past with respect to capitalizing or expensing different types of property in order that the company might be able to set up on its books, in accordance with the presently controlling system of accounts, the original cost of its properties?

A. Yes; I did make a study to find out what items were capitalized and what items were expensed.

Q. And wasn't that study necessary for the purpose which I have just indicated?

A. It wasn't necessary as far as determining the original cost for Exhibit No. 20, no; but it was necessary for the company in setting up their continuing property records. We were trying to do two jobs at one time.

Q. But, Mr. Antonelli, in setting up the continuing property records, you have got to start with original cost, have you
6263 not, and then make your adjustments that you have been describing?

A. Oh, you can do it many ways.

Q. Well, isn't that the way you did it?

A. Well, are you referring to the original cost or the continuing property records now?

Q. To your continuing property records, to the statement on the company's books, that is to appear on the company's books.

A. Well, in that case you show your original cost, and you show your adjustments, and you show items not capitalized.—previously capitalized, and you show 107 and 100.5.

Q. And in order to show that original cost on the company's books, didn't you have to make this determination as to what the company's policy was in the past with respect to capitalizing or expensing different types of property?

* * *

6267 The WITNESS. As far as setting up the books, I did have to make that study, but as far as determining the original cost for this Exhibit No. 20, it wasn't necessary.

By Mr. SLAFF:

Q. Now, are you planning to set up any different original cost on the company's books from what you have presented here in this case?

Mr. MILDE. I object to that.

Mr. SLAFF. Well, the reason I ask that—I have no hesitation in stating it—is because I understand that he says it was necessary, in order to set that up on the company's books, but wasn't necessary here. So, I want to know if there is any difference
6268 between what he proposes to set up on the company's books, and what he presented here, as to original cost.

The WITNESS. Well, I am just gathering information and getting—as Mr. Milde said—the figures ready, but I am not certain how those figures are going to be used.

By Mr. SLAFF:

Q. It is sort of nice that Mr. Milde said it for you, isn't it?

A. Oh, no.

Q. Mr. Antonelli, regardless of how they may be used by someone else, you have very definite ideas as to how they should be used, don't you?

A. I don't believe anybody knows just exactly how they are going to be used.

Q. No, no, Mr. Antonelli, but you have your judgment as to how the figures should be used; isn't that right?

A. Well, everybody has ideas, but as far as this case is concerned, I just don't know how they are going to be used.

Q. Aren't you posting on your continuing property records that you are setting up or proposing to set up for the company the same original costs that you show here in this case?

A. We are posting only certain columns, not all of the columns,—we are not filling out all the columns.

6269 We have posted the description, and we have posted the book cost because we know that that isn't going to change; and we have posted some other columns, but we haven't finished anything, and we are not going to finish anything until somebody decides what is going to be done with it.

Q. Now, then, will you tell me, Mr. Antonelli, whether in your judgment, as you view the situation, the original cost to be set up on the company's books is any different in your conception today from the original cost which you have presented here in evidence?

* * *

6272 The WITNESS. Well, my original cost is set up in such a way that it has different columns including the amounts
6273 that came from different places, and it was done with the purpose in mind that the company would pick up and choose or rearrange the columns in any form they wanted and decide what they were going to set up on their books after it was decided what "original cost" is.

TRIAL EXAMINER. After who decided what original cost is?

The WITNESS. Well, the company or the Commission, or after it was decided definitely what original cost was.

6274 Mr. MILDE. You mean original cost under the Code of Accounts?

The WITNESS. Yes, original cost under the Code of Accounts. I determined the original cost, and I set up the capitalized items under the capitalized columns, and I set up the expensed items under the expensed columns, and I set up all the rest of the items in separate columns, and that is the way it is shown.

Now I can't tell what it will be, what will be the original cost as per the continuing property records, or not.

By Mr. SLAFF:

Q. Mr. Antonelli, I am not asking you as to what anyone else may determine original cost to be, whether it be the court or commission or anyone else. I am confining myself solely to your judgment today, your conception today, and I am asking you whether today, in your conception, there is any difference between the original cost which you have presented here in evidence, and the original cost to be set up on the company's books? Will you please tell us?

A. As far as the totals are concerned, there wouldn't be any difference. As far as the classification, there might be. Maybe

the Commission will order certain items to be charged to 107, and others charged to 100.5, and so on.

Q. But as far as you are concerned—forget, Mr. Antonelli, please, or disregard if you will, please, what the
6275 Commission may order done or what the court, some court, may order done, and confine yourself, in your answers, just to your conception—isn't it a fact that the orignal cost, as you have presented it here in evidence, is, in your judgment, the original cost which should be set up on the company's books as you have here presented it?

A. Well, I say that the original cost is the original cost. Now I don't know how it is going to be set up.

Q. I know you don't know how somebody else is going to pick up where you left off, but I am asking you whether it isn't your judgment that the original cost which you have presented here in evidence, is the original cost which should be set up in the company's books in the same manner as you have here set it up in evidence?

* * *

6276 The WITNESS. I don't know what should be set up on the books. The original cost, as I determined it, I think is the right original cost, and it is set up in such a manner that you can take any kind of figures or combination of figures, but what should be set up on the books, I can't say, I don't know. It just never occurred to me, and I didn't have to know it.

By Mr. SLAFF:

6277 Q. Mr. Antonelli, aren't you in charge of the company's reclassification study?

A. Yes, sir; I am.

Q. Isn't that to reclassify the amounts that should be set up on the company's books?

A. Yes, sir, and we have gone as far as we can, but we havn't finished the job, and we don't know what to do, we are waiting now.

Q. And you have a judgment today, don't you, as to whether the original cost as you have determined it, in evidence, and presented it here in evidence, is any different from the original cost which, in your judgment, should be set up on the company's books?

A. As far as the total original cost is concerned, there shouldn't be any difference, and can't be any difference. That is the cost.

But how it is going to be set up on the books, that is a different matter.

Q. Mr. Antonelli, with respect to the reclassification study which you are making for the company, and the cost of which is some several hundreds of thousands of dollars, as I understand it, don't you today have any idea as to whether there should be any variation in the detail of the original cost between the way you have presented it here in evidence, and the way it should be set up on the company's books?

A. What detail are you referring to?

6278 Q. Any detail.

A. Yes; but there are all kinds of details. Are you referring to units of property, or to costs, or what?

Q. All right, let's take the accounts to which the amount should be charged?

A. That doesn't mean anything to me.

Q. The accounts under which the amounts set up should be set up—does that mean anything to you?

A. What accounts?

Q. Do you know what gas plant accounts are?

A. Yes; and I don't understand what you mean. Are you talking about adjustment accounts or plant accounts, or what?

Q. All accounts.

A. That doesn't mean anything, now.

Q. All right, you have presented certain original cost figures in evidence here, have you not?

A. Yes, sir.

Q. Will you tell us how you set them up by accounts?

A. Do you refer to Exhibit No. 20 now?

Q. Yes; 20 and 60.

A. All right, I classified them as to kinds of property, land and rights-of-way and leases, and followed this new Code of Accounts.

Q. Now in your judgment, should those amounts be classified any differently on the books of the company?

6279 Q. Well, not knowing what the Commission is going to decide, I will have to say again that I don't know.

Q. Do you have any judgment today with respect to that? I mean, out of all the close to three-quarters of a million dollars that has been spent for reclassification today, and the spending of which, I take it, you have been supervising, do you mean that you haven't yet evolved a judgment as to whether there should

be any difference between the way the amounts were set up in your original cost study in evidence here, and the way they should be set up on the company's books?

A. Well, this here is only a determination to show the original cost for rate-making purposes, and the other is something else.

Now the other has to be set up in accordance with the Code of Accounts. Now I will tell you how that was done. I might describe the columns that we used. But that is all I can say. I haven't got any judgment of what is going to be done. I know that in one column——

Q. (Interposing.) Let me break in. Do you have any judgment as to what should be done, that is the question that I have been trying to have your answer?

A. If I knew what should be done, we could have finished the job a long time ago. We don't know.

Q. You mean you just don't have any idea of what, in
6280 your judgment, ought to be done in that respect?

A. Well, we have been trying very hard to find out what should be done.

Q. And as far as you are concerned, you are still in the dark; is that right?

A. We have all the figures, we are just waiting for a decision.

* * *

Mr. Slaff. Well, are you still in the dark, Mr. Antonelli, in your own mind, as to what should be done with respect to setting up original cost on the company's books?

A. Well, I can give you my own personal opinion. Now that is my own personal opinion. We show first the material, the labor and the overheads, and the total original cost as I
6281 determined it.

Trial Examiner. You mean as you determined it in this case?

The Witness. Yes, sir, that is recorded to the penny.

After that—it is my own opinion, now—I will show the amount that is not previously capitalized on the company's books. It will show a column which is exactly the amount of the adjusted book cost that we have in here; and also it will show a column of the .107 adjustments which is Plant Adjustments to Property Constructed by the Company or Purchased from Non-Utilities; and another column, 100.5, Acquisition Adjustments, which is the difference between the original cost of property purchased from other utilities, and the purchase price.

Now that is my personal opinion of what should be done o the books, and the books will show my original cost, they wi show the book cost; we could get the adjusted book cost; w could get the non-capitalized items; and we could get the adjust ments, the plant adjustments, I mean; and the acquisition adjust ments.

It gives a complete picture of what was done, and that is wha we are doing, but we haven't gone beyond a certain stage becaus we don't know what to do next.

By Mr. Staff:

Q. Well, that is exactly what you have done in this case
6282 in evidence, in your exhibits here in this case, Mr. Antonelli is it not, except that certain of the columns shown on pag 31 you show, and you propose to show, in Account 107, and cer tain in Account 100.5?

A. There is no 107 and 100.5 here.

Q. That is right, you propose to show the amounts shown here in certain of the columns on page 31 of Exhibit 20, in Account 107 and in Account 100.5, on the company's books?

A. This statement here—I am referring to Statement B, now of Exhibit No. 20—shows the relation of the book cost to the original cost and also shows, separately, the property constructed by the company and purchased from other utilities, and it shows what was on its books, what were the adjustments, what was capitalized, how much was overheads, and so on.

Q. That is right. In effect, Mr. Antonelli——

A. (Interposing.) I think it is an intelligent way, at least I thought it was an intelligent way, and tried to make it so clear that anybody would understand what it is. I could have bunched all the figures and given you just original cost, and it would probably have been just as good.

Q. I am not at the moment implying that this is not an intelligent way of setting out the results that you came to. What I am asking you, if you will listen, is this: Isn't it a fact that what you have told us as to what you propose to have set
6283 up on the books, in your opinion, is just what, essentially, you have done here in your Exhibit 20, except the amounts in, say, columns 7, 8 and 9 and 10 of Statement B on page 31 will be included in Account 107?

A. No; 107 is plant adjustments——

Q. (Interposing.) Well, let me put it this way: The difference between original cost, as you determined it, and book cost

in so far as the amounts in those columns enter into that difference, will go into Account 107; is that right?

A. Well, I think it will go; I don't know.

Q. That is your judgment?

A. That is my opinion; I don't know.

Q. And the difference between purchase price and original cost, with respect to prior utilities, will go into Account 100.5; that is right, isn't it?

A. That is my opinion, that is in accordance with the Code of Accounts, that is my opinion, but I don't know if they are going to do it or not.

Q. Then if I may summarize, it is your judgment and opinion today that the original cost to be set up on the company's books is the original cost as you have determined it for purposes of this case, and as you have explained a few answers back it should be set up on those books?

A. No, sir; I didn't say that. I said how I did it, and what I thought it was going to be, and what was my personal opinion.

6284 Mr. SLAFF. Now, will you read my question, please?

(The question was read.)

By Mr. SLAFF:

Q. Isn't that a correct summarization?

A. The original cost that I set up in Exhibit No. 20 is to show the actual dollars paid by this company, and the amounts paid by the prior companies for property purchased from other utilities. That is the actual amount spent, what was the original cost. That was the reason for Exhibit No. 20; and the continuing property record, although utilizing all the same figures, they are set up differently, and I don't know what is going to be done with those figures.

Q. They are set up in somewhat different form, but all the basic facts and factors and figures are the same, are they not?

A. Sure they are, but as I said, my purpose was to determine the original cost of these properties, that is all, and that is all I had to do.

Q. I think you have told us that once or twice.

A. I have said it many times.

Q. Now then, in order to set up those facts on the company's books, you had to make a determination as to what had been the company's policy in the past with respect to expensing or capitalizing different kinds of property, isn't that correct?

6285 A. Well, naturally I analyzed all of the records and if I found the items under capitalized items, I put them under capitalized items. If they were expensed, I put them under expensed items. As I said before, we were trying to kill two birds with one stone. So I did find out and determine what was the policy of the company in regard to expensed items and capitalized items.

Q. And it was necessary for you to make that determination, was it not, in order to arrive correctly at your results?

A. It wasn't necessary as far as Exhibit No. 20 is concerned, no.

Q. We are talking about the costs that are to be set up, in your opinion, in your judgment, on the company's books.

A. I thought you were talking about Exhibit No. 20 all the time.

Q. Well, now, concerning yourself with the costs to be set up on the company's books, in your judgment it was necessary to make such a determination of company policy in the past with respect to expensing or capitalizing items, was it not?

A. Yes; certainly it was.

Q. You have presented here also Exhibit 99, which is entitled "Data Furnished the Federal Power Commission at its Request as to Amounts of Direct Material and Labor

6286 Costs, Unloading, Hauling and Warehouse Handling Costs, Indirect Field Costs and Overhead Costs not Capitalized, for Major Accounts, Classified by Years during which these Costs were Incurred by the Company," and that exhibit relates, does it not, to the determination, among other things, of overhead costs shown in your Exhibit 20?

A. This Exhibit was a request by Mr. Smith, and relates to direct labor costs not capitalized, and overheads.

Q. And the overheads to which it relates are the overheads which are shown in your Exhibit 20, is that correct?

A. Yes, sir.

Q. And the method of determining those overheads is shown in your Exhibit 20-A, is that correct?

A. The method was explained in Exhibit 20.

Q. Let me put it this way. Your method is stated in Exhibit 20, and illustrated by Exhibit 20-A, is that correct?

A. Well, it is stated and illustrated in Exhibit 20, and this (referring to Exhibit 20-A) is one page of the details of Exhibit 20.

Q. That is a summation sheet that illustrates your method, isn't it, and shows the percentages that you arrive at, that Exhibit 20–A?

A. Yes, sir.

Q. Your determination of overheads to be applied to con-
6287 struction was on the so-called dollar for dollar method, is that right?

A. As far as the general overheads are concerned; yes, sir.

Q. That is on the basis that a dollar of construction took the same amount of general overheads as a dollar of operations of the company, is that essentially correct?

A. Yes.

* * *

Mr. MILDE. Exhibit 20–A?

Mr. SLAFF. No; this Exhibit 99, which is the detail, and I want to get some statement here with respect to his underlying assumptions.

* * *

By Mr. SLAFF:

Q. I want to know, Mr. Antonelli, whether, in your conception, the construction operations of the company are essentially a by-product operation?

A. I couldn't answer that question; I don't know.

6288 Q. Well, let's go at it another way. It is a fact, is it not, that the principal business of the company is to operate its properties?

A. Well, that is outside of my line, I don't want to pass judgment on that kind of a question.

Q. Well, isn't that necessary, Mr. Antonelli—that is to say, is not a judgment with respect to that necessary in order to arrive at a proper basis of allocating overheads between construction and operations?

A. Oh, they do operate the company, and also supervise new construction work.

Q. But isn't it a fact that the principal business of the company is to operate its properties?

A. Yes, sir; it is.

Q. And then isn't it also fair to say that the construction operations, as carried out by the Hope Company, are what might be termed "by-product" operations?

A. Oh, no; in this case I have found out that the company's supervising forces spent a great deal of time in new construction work.

Q. Then as I understand it ——

A. (Interposing.) As a matter of fact, they spent more time than in operation.

Q. Then as I understand your last answer, the construction operations, as carried out by Hope, are not what might be termed "by-product" operations?

6289 A. I am just talking from experience in going through the records, and I noticed that the company's supervising forces were spending a great deal of time in new construction work.

Q. Then you would not term the construction operations of the company "by-product" operations?

A. Well, I don't know what you would call them, whether you would call them "by-product" or not, but they spend time on new construction work, and they spend time on operation. I don't know which is the "by-product."

Q. Well, is the construction work incidental to the operations, or is it the other way around, or are they on a parity of importance to the company?

A. I don't know, I can't answer that question.

Q. Well, Mr. Antonelli, wasn't that determination necessary to be made in order to determine the proper basis for allocating general overheads?

A. The basis was that after a great deal of study——

Q. (Interposing.) No, no, no—I have asked you whether that was necessary; I haven't asked you, Mr. Antonelli, what your basis was. I have asked you whether a certain determination on your part was or was not necessary to your determination as to how these general overheads were to be allocated. Will you please respond to that?

* * *

6290 The WITNESS. Well, if you knew how these overheads were worked out, you wouldn't ask me that kind of a question.

By Mr. SLAFF:

Q. I have asked you that question—suppose you answer it?

A. That is not the way I determined these overheads.

Q. You can't answer that question?

A. That is not the way I determined the overheads.

Q. Can you answer the question?

TRIAL EXAMINER. Was it necessary or was it not—that is all.

Mr. MILDE. Well, Mr. Slaff has a lot of words in there which may mean something, but they obviously don't mean anything to Mr. Antonelli.

Mr. SLAFF. I will reframe the question.

* * *

By Mr. SLAFF:

Q. In order to make a determination of how general overheads were to be allocated between operations and construction, didn't you have to come to a conclusion as to whether construction was a subsidiary part of the company's whole business, or whether it was on a parity with the operations of the company?

6291 A. No, I did not.

Q. And that was of no importance or consequence to you in your determination of overheads, is that correct?

A. No; not the way I determined these overheads.

Q. Now then, your assumption was, was it not, that a dollar of construction took the same general overheads that a dollar of operations took?

A. Yes, sir.

Q. And is it your answer that it takes that same dollar, regardless of whether construction is a subsidiary part of the company's whole business, or whether it is on a parity with the operations of the company?

Mr. MILDE. I want to object to that question unless Mr. Slaff states to the witness what he means by the phrases "subsidiary part" and "on a parity with the operations of the company."

Mr. SLAFF. Well, I have tried to use the term "byproduct operation." The witness didn't seen to have much of a concept of the term "byproduct operation."

Mr. MILDE. I don't understand what you mean by a subsidiary or a parity.

Mr. SLAFF. I think you understand, Mr. Milde, what I mean by "byproduct operation."

Mr. MILDE. Not as applied to a natural gas operation.

6292 TRIAL EXAMINER. If you used the expression "purely incidental," would that mean anything?

Mr. MILDE. That seems a little more like something that has some meaning. I don't know whether it would to Mr. Antonelli——

Mr. SLAFF. (Interposing.). Of course, if my friend Milde here wants to characterize the testimony of his witnesses as meaningless, far be it from me to dissuade him from that, but I have used that term simply because his witnesses have been using that term and have been decribing the construction operations of the Hope Natural Gas Company as "by product operations."

When it comes to determining whether or not one of the exhibits which the Commission has introduced was proper, Mr. Rhodes was very eloquent that our exhibits don't show full costs, because construction is just a "by product operation," construction is just incidental to the operations of the company. And I used those terms only because I thought that they were intelligible at least to the company people.

* * *

By Mr. SLAFF:

Q. Mr. Antonelli, are you familiar with what is meant by the "incremental basis" of allocating overheads?

6293 A. No, sir; no.

Q. Have you never heard that term used, Mr. Antonelli, with respect to overheads?

A. I might have, but I don't recall it.

Q. I mean you, right now, have no knowledge whatever as to what is meant in the accounting or engineering profession by the term "incremental method," with respect to prorating overheads; is that right?

A. Do you mean by that, breaking up the overheads to various parts of it—increments?

Q. No; I mean by that that an operation, which is a subsidiary operation, for example construction, possibly by an operating company, shall take only those additional overheads which are required by that work, and that the principal occupation of the company shall take the general overheads as they exist normally?

A. Yes, sir; I have.

Q. That is to say, you are familiar with that use of the term?

A. Yes, sir.

Q. You did not in this case pro rate overheads, your general overheads, on an incremental basis, did you?

A. No; I allocated them on a dollar cost basis between operations and new construction work. I did that because that was the only way possible to do it, having in mind the records

6294 available that were available.

Q. And did you make any determination with respect to how overheads had been charged in the past?

A. Well, in going over the company's records, I found that general overheads were not recorded on the company's records.

Q. That is, in the fixed capital records?

A. In the fixed capital records, yes; that is correct.

Q. That is to say, overheads had been expensed, is that correct?

A. That is right.

Q. Now, turning for a moment, Mr. Antonelli, to the problem of acquisitions by the Hope Company, you are familiar with the Clarksburg Light & Heat Company acquisition?

A. Yes, sir; I am.

Q. Was that an affiliated company?

A. Yes, sir; it was an affiliated company.

Q. And that was purchased, was it not, for a consideration which consisted of some $10.67 in cash and 13,693 shares of Hope Natural Gas Company common stock; is that correct?

A. I don't know anything about that. I wasn't interested to determine how the sale took place.

Q. Did you testify that the Hope Company had not recorded the original cost of this property on its books?

A. I don't recall, but I think I testified that on the
6295 company's books, the Clarksburg Light & Heat Company is recorded at vendor's book cost, and the difference between this cost and the purchase price was added to Hope's depreciation reserve. I believe I testified to that—but that is the fact.

Q. Now do you know, or what is your testimony with respect to whether or not the property of the Clarksburg Light & Heat Company was recorded on the books of the Hope Company at original cost?

A. The property was recorded at book cost, at vendor's book cost, of $2,233,252.76.

6296 By Mr. SLAFF:

Q. You stated as follows at page 5049 of the transcript, record of July 7:

"Question—," Do you want to have that before you?

A. Yes.

Mr. MILDE. [Handing.]

By Mr. SLAFF:

Q. Beginning at line 4:

"Question: Did you ever find the company recorded or attempted to record any estimate of the original cost of purchased property at the time of acquisition?

"Answer: No, sir."

You so testified, did you not?

A. Yes, sir; I did.

Q. All right. Now, let's go to the—and was that supposed to apply to the Clarksburg Light & Heat Company acquisition as well as others?

A. It applies to all purchases.

Q. Now, you made a study of that purchase, did you?

A. Yes, sir; I did.

Q. All right. Now, what was the consideration given by Hope Company for the property which was acquired?

A. I went back to the vouchers and got the actual cost. That is all I was interested in.

Q. Did the vouchers show the consideration given by
6297 the actual cost paid by Hope Company?

A. This was a prior utility company and we had practically all of the records available.

Q. Well, did the vouchers show the——

A. (Interposing.) I had thousands of vouchers. I had to go by item—unit by unit and well by well—and found the cost. It wasn't necessary for me to go to purchase vouchers. Purchase vouchers don't show anything.

Q. Did you go to the purchase vouchers as you did in connection with the Flaggy Meadow acquisition you testified to on July 7?

A. I——

Q. (Interposing.) Did you or didn't you?

A. Yes; I have seen the purchasing voucher; yes.

Q. O. k. Now, what is the consideration recorded there?

A. Well, as I stated now, the cost to the vendor was—I mean the purchase price was $1,369,310.67.

Q. That is the amount that was recorded in the books in the plant account, is that right?

A. Well, I would have to get the voucher before——

Q. (Interposing.) Yes. Will you do that?

A. Well, I haven't got it here.

Q. Well, I will put it this way to you, Mr. Antonelli: Suppose you answer to the best of your present information and knowledge and make any subsequent corrections that you deem

6298 fit. Is it not true that the consideration given by Hope for that property was some $10.67 in cash and 13,693 shares of Hope common stock?

A. My recollection is that that figure is correct; yes.

Q. All right. Now, is it also not a fact that the value placed on that stock by the Hope Company was, at the time of issue, $1,464,114.75?

A. Well, I am sorry. I don't know. I don't remember.

Q. You can verify that, can you not?

A. Well, yes.

Q. Do you have here any data from which you can verify that?

A. No. Not in this place.

Q. Do your assistants here have any such information?

A. No, sir.

Q. That consideration is shown on the purchase voucher?

A. I think it is shown; yes.

Q. Let me refresh your recollection, Mr. Antonelli, while I think of it. I show you a letter dated May 17, 1940, on the letterhead of the Hope Natural Gas Company, addressed to Mr. J. A. Hennig, Examiner in charge, Federal Power Commission, Clarksburg, West Virginia, and signed by George N. Reed, and ask you whether that refreshes your recollection as to the facts?

* * *

6299 Q. So, then, it is a fact that the consideration given by Hope for that property in addition to the $10 of cash, was common stock which Hope valued at $1,464,000. That is correct, is it not?

A. Yes; according to this letter; yes, sir.

Q. And that amount of consideration paid by Hope for this property was $94,814.75 above the net book cost of the Clarksburg Company property, isn't that correct?

A. That is, according to this letter, that is correct. It states so.

6300 Q. And that amount, that difference, to wit: that amount of 94-odd thousand dollars, was recorded by Hope in a "property appreciation account," was it not?

A. That is what the letter states and I suppose that is correct; yes.

Q. And that respresented, did it not, appreciation over the original cost of the Clarksburg Company's property as the Hope Company then conceived it to be?

A. No, sir.

Q. Isn't that correct?

A. No, sir. The book cost of the Clarksburg Light & He Company did not reflect the original cost of the Clarksburg Lig & Heat property.

Q. The book cost of the Clarksburg property did not repres the original cost as you now conceive that original cost to b That is correct, is it not?

A. Now—and the fact is that it did not represent the origin cost because all of the costs were not recorded. The well co struction costs weren't recorded. It couldn't be.

Q. You have testified, Mr. Antonelli, that the Hope Compan never recorded or attempted to record any estimate of th original cost of purchased properties at the time of acquisitio isn't that so?

A. I still say that that is so; yes.

Q. Now, you do not then conceive that the Hope Com
6301 pany, when it recorded 1,300,000-odd dollars in its plan accounts in the Clarksburg acquisition, was attempting t record the original cost of the company's property, is tha correct?

A. I say they did not attempt to record the original cost of th property; no, sir.

Q. The $94,000 entry that was made in an account called b the Hope Company, "Property appreciation account," was no in your judgment designed to represent the appreciation in th property above original cost which had been paid for by th Hope Company, is that correct?

A. Yes, sir.

Q. Do you know what the "Property appreciation account" wa supposed to represent?

A. No, sir. I wasn't interested and I didn't have any occasion to find out; no, sir.

Q. Mr. Antonelli, you weren't interested in finding out what that account paid before you testified flatly that the company never attempted to record any estimate of original cost of ac quired properties, is that correct?

A. I still say that it didn't record any estimates——

Q. (Interposing.) No, no, no. Will you please answer th question.

* * *

6302 A. Yes, sir.

By Mr. Slaff:

Q. That is correct?

A. Yes, sir.

Q. In other words you came to a determination of what the company had done or attempted to do on its books, with respect to a particular acquisition, without investigating all the entries that had been made by the company in connection with that acquisition, is that correct?

A. I investigated——

Q. [Interposing.] Now, is that correct or not?

Mr. Slaff. I submit that can be answered categorically.

The Witness. I will answer it with reservation; yes.

By Mr. Slaff:

Q. All right, so now——

Mr. Milde [Interposing]. Wait a minute. Let him state his reservation.

Mr. Slaff. That is just what I am going to get to.

By Mr. Slaff:

Q. With reservations you can say that you can tell us whether the company attempts to record an acquisition at original cost, without investigating all the records made by the company in its books at the time of acquisition. That is correct?

6303 Will you please tell us whether that is correct and then if you want to state the reservation, go ahead?

A. Yes; with reservation, I will say, yes.

Q. Go ahead and tell us what the reservations are?

A. Well, I determined the original cost. I went to every voucher that shows individual items, which were part of the Clarksburg Light & Heat Company, or any other prior utility, and made sure that the actual original cost was really the actual original cost, and not what was on the books, and I am a hundred percent certain that the company never made any estimates in any case. I do not know that the company had made no estimates.

Mr. Milde. Of original cost?

The Witness. Of original cost; yes.

By Mr. Slaff:

Q. And that is your sole reservation?

A. Certainly. I examined every voucher. I examined every item.

Q. That is, you examined everything except all of the accounts of the company?

A. I was interested in individual items. I wasn't interested in the purchased properties as they existed in 1929 or what not. I was interested in the items that existed on December 31, 1938.

Q. That is right.

6304 A. Now, that was a utility. What I had to do, is go to the vouchers and find the actual cost of these properties.

Q. Yes.

A. While I was doing that I was comparing with the books and I am darn sure that the company never made any estimates on original cost.

Q. You can tell us that what the company recorded or attempted to record in its books at the time of acquisition, with respect to original cost, without making a complete examination of the company's books; isn't that so?

Mr. MILDE. I object to that question.

Mr. SLAFF. Well, if it is not so, he will tell me so.

Mr. MILDE. It is a repetition that has been asked at least five times. Mr. Antonelli has stated that he has examined all the books and records and he asked him——

Mr. SLAFF [Interposing]. He stated directly contrary to that, Mr. Milde.

By Mr. SLAFF:

Q. Did you examine the property acquisition account?

A. I examined every voucher, every record, every book that was necessary to examine.

Q. Did you examine the property appreciation account record——

A. [Interposing]. Examined——

Q. [Interposing]. Just a minute. Relax.

6305 (Continuing.) Record, to determine what that purported to be. Didn't you testify just a few minutes ago you did not?

A. I don't think I did, because I got all the costs that it was necessary to get in order to determine the original cost. I can show a voucher for everyone of those costs. That is all that was necessary for me to do. I didn't have to do unnecessary things.

Q. Now, let's get back to the property appreciation account and the record thereof made by the company.

* * *

Q. Now, did you or did you not make an examination of the records in the property appreciation account, to determine what that was supposed to represent at the time it was recorded in the company's books?

A. Personally, I did not.

6306 Q. Now, did any of ——

A. (Interposing.) Excuse me, I haven't finished.

Q. I submit he has finished. That is all I asked him, whether he did or didn't.

A. I was just going to say, somebody else might have done it.

Q. That is the next question I was going to ask you, Mr. Antonelli. You will get it.

A. Excuse me.

Q. Did any of your assistants do that and report to you in respect to that?

A. I don't recall, but I assume that somebody did look at this appreciation item, but I can't recall offhand. There were so many things to remember.

Q. What does "property appreciation" mean, Mr. Antonelli?

A. Well, it is probably an increasing of value or what not.

Q. Well, it means increasing value rather than what not, doesn't it?

A. Well, increasing cost, let's say.

Q. Increasing cost over what?

A. Over some other cost, I don't know.

TRIAL EXAMINER. Over what?

The WITNESS. Over another cost.

TRIAL EXAMINER. The increase of one cost over another

6307 cost?

The WITNESS. Yes.

By Mr. SLAFF:

Q. And the cost that was recorded on the Hope Company books was the book cost on the books of the Clarksburg Company, isn't that so?

A. Yes, sir.

Q. And the depreciation reserve was also picked up, was it not?

A. Yes, sir.

Q. And you are telling us now that you know, now, that, back in '29, when the company recorded those figures on its books, it was not attempting to record on its books the original cost of those properties, is that correct?

A. Oh, yes. I am very certain that they weren't attempting to record the original cost. They were recording the book cost of Clarksburg Light & Heat Company. A hundred percent certain.

Q. And is one of the factors in your determination, the fact that no consideration was given to well construction costs at the time of the acquisition, because it had been the practice of both companies to expense such costs?

A. Yes; it is, because, without having the full costs of these wells, you couldn't get your original cost.

Q. In other words, then, what you are saying is that
6308 the Hope Company, at that time, was not attempting to record on its books what you presently conceive to be original cost, as you have testified to that, is that right?

A. Yes; and what anybody will think original cost is, the full original cost.

Q. Well, let me see if I get you straight, so the record will be clear Mr. Antonelli: The Hope Company did not record on its books, with respect to Clarksburg acquisition, what you presently consider the original cost—right?

A. Yes, sir; that is right.

Q. It did not attempt to record on its books what you presently consider the original cost—that is correct?

A. Yes, sir; that is correct.

Q. Illustrative of that is the fact that it did not record on its books any well construction costs which had been expensed previously by the Clarksburg Company, is that correct?

A. Yes, sir.

Q. Now, do you know whether in 1929 the Hope Company considered original cost to be what you now consider it to be?

A. I don't know what the company's mind was in 1929. I am sure.

Q. That is right. So that you do not know, Mr. Antonelli, whether in 1929 the company attempted to record on its
6309 books what it then considered to be the original cost of acquired properties, isn't that correct?

A. No, sir; because it was very plain it wasn't original cost. didn't include all of the costs. How could it include original cost when you had only part of the costs?

Q. Mr. Antonelli, you know that conceptions of what is original cost differ.

A. There is only one original cost, the full cost.

Q. There is only one original cost and Antonelli is its prophet. Mr. Antonelli, is it not a fact, as demonstrated in this case, that there is difference of opinion as to what represents actual original cost?

Mr. MILDE. Between reasonable men?

Mr. SLAFF. I will add, between reasonable men and men equally competent in the field of engineering and accounting with Mr. Antonelli.

The WITNESS. Well, I can't conceive the idea that if a person paid $2,000 for a well and capitalized $1,000, that $1,000 is the cost of the well. It is $2,000. It is plain thinking.

By Mr. SLAFF:

Q. Now, Mr. Antonelli, we are wasting a lot of time. Now, isn't it a fact, Mr. Antonelli, that there is difference of opinion between equally competent people as to what is original cost?

6310 A. Yes: there is, from a bookkeeping point of view and accounting point of view, yes; but not as to actual cost. It couldn't be anything else but just what you paid for it.

Q. All right. Now, is it not a fact that in 1929, what the Hope Company then conceived or considered to be original cost of property was different from what you today consider to be original cost of that property?

A. My idea is that I don't think the company ever considered that it was original cost. They just set up the book cost. I don't think they talked anything about original cost.

* * *

A. I don't know what the company thought about it.

By Mr. SLAFF:

Q. Then you cannot tell us whether the Hope Company in 1929, or at any date in the past, with respect to acquisition, attempted to record in its books what it then considered to be the original cost of the properties which it was acquiring, is that so?

A. All the investigations that I made shows that the company never attempted to show original cost on their books of the property that they purchased. They showed the purchase price.

6311 Q. Mr. Antonelli, you have testified just now that you don't know what the company considered to be original cost in the past, is that right?

A. The facts show ——

Q. (interposing). Is that or is that not right, have you so testified?

A. Yes, sir; with qualifications.

* * *

Q. Now, then, with respect to acquisitions made in the past, is it not a fact, then, that you cannot tell us whether the company did or did not attempt to record on its books the original cost of those properties acquired as it then considered original cost?

A. My study convinced me that they did not attempt to set up the original cost, and I can prove it to you.

Q. You are in luck, Mr. Antonelli. Your study convinced you that the company did not attempt to set up original cost as you today conceive original cost to be, and to mean, isn't that right?

A. No, sir. I can prove to you that what they set on the books was the purchase price and not the original cost. I am
6312 talking about facts now. I can prove it to you with figures.

Q. We know that purchase price went on the books, Mr. Antonelli, and obviously that is what we are coming to, if you can testify to it, as to whether or not that purchase price did or did not represent original cost. Now, then——

A. (interposing). It was very plain it didn't represent original cost.

Q. It was very plain to you, Mr. Antonelli, that it did not represent original cost, as you now conceive and represent original cost to be, isn't that what you mean to say?

A. It is very plain that what they set on the books is not the actual price that the predecessor paid for it.

Q. Well, let's start again and just see if we can develop this in reasonable sequence, Mr. Antonelli: You have testified, have you not, that you do not know what the Hope Company considered original cost to be?

A. Yes, sir.

Q. At the time of its various acquisitions?

A. Yes, sir.

Q. All right. If you do not know what the Hope Company considered original cost to be at the time of acquisition, now you represent, do you, that you can tell us whether the Hope Company recorded or attempted to record original cost of acquired properties as it then conceived the meaning of the term?

* * *

6315 The WITNESS. No; I can't.

By Mr. SLAFF:

Q. All right. So then all your testimony with respect to whether or not the company recorded on its books or attempted to record on its books the original cost of acquired properties, refers only to original cost of acquired properties as you now conceive original cost, is that right?

A. It refers to the actual original cost. I mean, the amount of money the predecessor paid.

6316 Q. Mr. Antonelli, someone other than you and I will decide what is the actual original cost?

A. Well, I am saying that it refers to what actually somebody paid for the properties and not what was recorded on the books, or what was the purchase price.

Mr. SLAFF. Well, I wonder if the reporter would re-read my question, and I wonder if you would tell me, Mr. Antonelli, if that isn't, in the light of what you have just said, if that isn't a fair statement, as I have put it?

(Whereupon the pending question, as above recorded, was read by the reporter.)

A. Yes; that is right.

By Mr. SLAFF:

Q. All right. Let's for a minute turn to the Flaggy Meadow acquisition. Will you turn to the Fayette County Gas Company acquisition?

A. All right, sir. You mean in Exhibit 98?

Q. Well, just direct your attention to that, and then we will—you may have some papers in connection with that. In your determination of original cost of that property, what did you determine as the value per acre, and cost per acre, of the gas acreage of the company?

A. I used the purchase price, which I think it was $14.50 per acre. I am not certain, but I think that was
6317 $14.50.

Q. And that is the amount which is recorded on the company's books in connection with the acquisition of that property?

A. Of what is left of that property.

Q. Yes, sir. Did you record that amount—did you use that amount as representing the original cost of that gas acreage?

A. Certainly; yes.

Q. I see. As to that, that amount was entered on the company's books as original cost, was it not? The gas acreage in that acquisition.

A. In the case of leases, we set up the original cost—the original cost was the cost of—the purchase cost, put it that way, the purchase cost for leases purchased from other utilities.

6318 Q. Well, so that in that respect, at least, the company, as far as you are concerned, did record on its books the original cost of property acquired from prior utilities?

A. Yes. In this case exception was made, I think in accordance with rulings by the West Virginia Commission. I am not certain, but I had instructions by the company to do so.

Q. And you did the same thing, did you not, with respect to the acquisition from the Flaggy Meadow Gas Company? That is to say, you took as original cost the cost of gas leases, as recorded at the time of acquistion. Is that right?

A. We did this with respect to all of the purchased leases, and I said why we did it. We did it because we had special instructions in the case of leases.

Q. Well, of course you had no qualms about disregarding general instructions in the system of accounts, did you? I am referring specifically to instructions 2-(b).

A. No.

Q. So then you represented to this Commission that the original cost of the leases, if I may sum up—leases of acquired utilities—was the amount that had been recorded at the time of acquisition?

A. Yes, sir.

Q. All right.

A. And I said why.

6319 K. That is right. That represents a recordation by the company, does it not, on its books, of the original cost of that property? That is correct, is it not?

A. Yes, sir.

Q. So that, to that extent, at least, your previous testimony that the company did not record original cost of acquired properties on its books is in error. That is correct, is it not?

A. That is an exception and I say I gave the reason why we did that. We had special instructions.

6320 Q. And in the Fayette County Gas Company purchase, that represents about a third of the purchase price, does it not?

A. You mean now or at the time of the purchase?

Q. At the time of the purchase.

A. I think it was about $200,000.

Q. Out of six?

A. Yes.

Q. Yes; that is right.

A. But we don't have $200,000 now. We don't even have $200,000 left in the entire Fayette County Company. We have only fifty leases.

Q. I understand that. Now, with respect to the Flaggy Meadow acquisition: When was that property constructed?

A. Constructed or acquired?

Q. Constructed?

A. Prior to 1902.

Q. Over what period prior to 1902?

A. Oh, I would say offhand—I don't know—I see a line here, 1895.

Q. When was the bulk of the property constructed, Mr. Antonelli?

A. Well, I can't say offhand. Prior to 1900. I can't guess; I can't say.

6321 Q. That property was acquired in 1902, was it not Mr. Antonelli?

A. That is right.

Q. And isn't it a fact that the bulk of that property had been built in about the five-year period preceding 1902?

A. Something like that.

Q. Yes.

A. But I am not certain.

Q. Certainly.

A. My records show that some wells were drilled in 1895, 1900, 1901.

Q. Surely. Well, I am just talking about the bulk of the property. And the property acquired was recorded in the plant account of the Hope Company at average cost, was it not, Mr. Antonelli?

A. Was recorded at the purchase price.

Q. Was the purchase price spread among the different accounts?

A. Yes, sir.

Q. And was that spread determined by a determination of average cost of the property in each of the accounts, Mr. Antonelli?

A. Yes; they used the current market prices.

6322 Q. We will get to what they used, but it was recorded, was it not ——

A. (Interposing.) It was recorded——

Q. (Interposing and continuing.) As stated in the voucher, at average cost?

A. Yes; average cost determined by Hope; yes.

Q. That is right?

A. Yes.

Q. Now, you say, do you, that that average cost is average cost for the year 1902?

A. That is the average cost for the previous two or three years. I am not certain whether it was two, or three, years. The average current market prices for 1902, 1901, 1900—the previous two or three years.

Q. It couldn't have been the previous three or four years, or anything like that?

A. I can get you the exact figures if you wish. I don't know if it was two years or three years, but it was the previous two or three years.

Q. You say you spot-checked those costs?

A. Certainly I did.

Q. Now, did you have some of your people make that check for you or did you yourself do it or review what was done?

A. I had some people make it for me.

6323 Q. You made no independent study of your own to determine whether average cost meant average cost over the period during which the bulk of the property had been constructed or something else?

A. I instructed ~~to check exactly~~ what the average costs shown on the voucher were, and how they were obtained, and that man did that work and he understood perfectly what I asked him to do.

Q. When you speak of the voucher in that last answer, or the vouchers, are you referring to the Hope Company vouchers or the predecessor company's vouchers?

A. Let me see. I was referring to—I think it is H–45; I will have to check it; or H–48.

Mr. MILDE. Was it the Hope Company voucher or the voucher of a predecessor company?

The WITNESS. It was a Hope Company voucher.

By Mr. SLAFF:

Q. Did you have any vouchers of the Flaggy Meadow Company, which you could consult?

A. I can't recall offhand; no. I had a receiving voucher. No, I don't know; I don't——

Q. (Interposing.) Well, when you testified earlier in the afternoon that you had a voucher for every single cost shown in your original cost, you weren't then referring to acquired properties?

6324 A. I have vouchers for certain companies like Mountain State and Clarksburg Light & Heat, to the predecessors.

Q. But not for all of them?

A. Not for all of them.

Q. To that extent, you do not have vouchers showing the cost of the properties going into the total of the original cost, have you?

A. I have some vouchers but not all of the vouchers. I don't know how much, but I had quite many vouchers of the predecessor companies.

Q. All right. Now, with respect to the Flaggy Meadow acquisition, you are telling us that average cost, at which the over-all cost was spread between the different plant accounts, did not represent average cost over the period during which the bulk of the company's property had been installed; is that correct?

A. That is correct.

Q. And that is based upon, as you have testified, the determination that some of your assistants made in this case?

A. Yes, sir.

Q. Now, there, again, in that case, you have recorded, have you not, $6.00—you have recorded acreage at some $6.01 per acre as representing the original cost of that acreage?

6325 A. I don't have the figure, but I think you are right. I am not certain, but it runs through my mind that it ran about $6.00.

Q. And to that extent you are representing that the Hope Company did record, at the time of the acquisition of that property, the original cost of the gas acreage acquired; is that right?

A. Yes, sir; and I again would like to explain that that was done—that was an exceptional case and it was done under the instructions of the West Virginia Commission, that, in the case of purchased leases, that we should record the purchase price.

Q. By the way, Mr. Antonelli, when you speak of this instruction of the West Virginia Commission, in this qualification you are making, are you speaking of a recent instruction?

A. I don't know how recent the instructions are, but—let me see—well, I suppose I got the instructions a year ago.

Q. Well, that is, instructions which were given to you within the past year or so?

A. Yes.

Q. By the Commission, as to how that matter should be handled; is that right?

A. Well, they were given to me by the company and I
6326 understand that they got it from the Commission.

Q. Well, that, at least, is your understanding of what was represented to you by the Company?

A. Yes.

Q. You made no independent effort to get an instruction or interpretation from the West Virginia Commission in that respect?

A. No, sir. I was instructed that, in the case of the leases, I should use the purchase price, and I think they got the instructions from the West Virginia Commission. However, I am not quite certain.

Q. You testified, did you not, that there was no possibility of duplication of costs, as shown in your Exhibit 60 and 20, and amounts recorded on the Company books; is that correct?

A. What kind of a duplication do you refer to?

Q. Duplication of cost.

A. I know. In properties?

Q. Yes.

A. What?

Q. Yes; in the property account.

A. One item could appear in two accounts; is that what you mean?

Q. Yes, that is right; or in the same account.

A. Oh. I am certain there is no duplication.

6327 Q. Well, suppose a property in the 1920 reclassification of accounts—suppose a property was missed, would that mean that the cost as recorded on the Company's books at that time would also have been missed?

A. I didn't pay any attention to the 1920 reclassification. I just ignored it.

Q. Mr. Antonelli, did you testify, when asked how property exists which does not show on the Company books, didn't you testify that it might be that, during the reclassification of accounts, certain properties were missed and, when asked what reclassifications you meant, you referred to the 1920 and 1932 reclassifications?

A. Yes; certainly.

Q. All right.

A. Well, if they were missed and then we picked them up in the field and found the costs on the books, we restored them. If we didn't find the cost on the books and records, by the way, then I included them under the column, "Direct material and labor not capitalized."

Q. Well those former reclassifications were just that, weren't they—reclassifications of cost on the books?

A. Well, let me tell you what they did in 1920.

Q. All right.

6328 A. They had certain dollars set up on the books. They didn't change the dollars.

Q. That is right.

A. They went out in the field and made a new inventory and set up this inventory and reclassified these dollars they had as of 1920.

Q. That is right, so——

A. (Interposing.) Under one voucher.

Q. Pardon me. Go ahead.

A. M-699. That is an inventory voucher. It doesn't mean anything. What I did, I ignored that voucher. I went back and got the actual cost by first identifying the property——

Q. (Interposing.) Let's not get to what you did. We are still at 1920. We will get down to what you did. I am just asking——

* * *

6329 By Mr. Slaff:

Q. Now, confining ourselves solely to the 1920 reclassification, the dollars on the Company books were spread over an inventory that was then taken; isn't that right, Mr. Antonelli?

A. Yes, sir.

Q. And so all the dollars that had been on the books before the reclassification still remained on the Company's books after the reclassification—that is correct, is it not?

A. All the dollars; yes.

Q. Surely. And when you say certain properties were missed, or might have been missed, what you meant was that, in making the inventory, certain properties might have been omitted from that inventory; isn't that correct?

A. Well, not intentionally.

Q. Of course we are not going into the question of intentio at this time.

A. They were missed, that is all.

6330 Q. And omitted from the inventory?

A. All right, omitted from the recording it on the b.oks.

Q. The dollars were recorded on the Company's books, wer they not?

A. Yes.

Q. All the dollars—right?

A. That is right.

Q. All the property, however, the items of property, might no have been recorded on the Company books; is that correct?

A. That is correct.

Q. Now, when you went out in your present original cos determination and found a property that had been missed i 1920, you determined the original cost of that property, did yo not?

A. Yes.

Q. Now, in those cases, where you could find that some cos of that property had been recorded to another item of property you eliminated that; is that correct?

A. I don't get that last question.

Q. All right. With respect to property that you found i your present inventory, which had been missed in the earlier in ventory, you determined—you made an estimate of the original cost of such property—right?

6331 A. No; I first made—I tried to find the voucher and i many cases I did find the voucher.

Q. Yes.

A. Not the 1920 voucher, but the actual voucher.

Q. That is right.

A. And I put it in.

Q. That is right, and you either determined the cost from voucher or made an estimate of the cost of such property; isn't that right?

A. I put it the other way: For instance, as I tried to say— I was stopped—I didn't pay any attention to the 1920 inventory voucher. I went out in the field.

Q. That is what we are afraid of, Mr. Antonelli.

A. And got the inventory and went back to the original vouchers and got the cost. I just kept that 1920 inventory voucher. It didn't mean anything. So I went back to the actual

cost. If I didn't find the voucher I estimated or put it under the column, "Material and labor," and "Direct material and labor not capitalized," so there couldn't be any duplication and there couldn't be an improper distribution of costs.

Q. Now, do you mean to tell us that you paid no attention whatever to—what is that voucher number? M-69? The adjustment?

6332 A. M-699.

Q. M-699; the 1920 reclassification voucher?

A. That is right.

Q. You paid no attention to that in your original cost determination?

A. No sir. Went right past it.

Q. All right. Now then, going back—Well, included in your total of inventory transferred and correction adjustment, column 6, pages 31 and 32 of Exhibit 20, included in the total of $1,804,000, red figure in that total, isn't there a total of approximately $155,000 which are adjustments of vouchers M-699 and A-155?

A. Where are you getting those figures from?

Q. I am just asking you a question. The figures as they come now, for your convenience, are from Mr. Pace's Exhibit 67-A.

A. I don't know anything about Pace's exhibit.

Q. Don't you know anything about Pace's exhibit?

A. I wouldn't want to explain Pace's exhibit now.

* * *

Q. I am asking, independently of Mr. Pace, whether
6333 you know whether or not there is contained in your Column 6 of Inventory and other adjustments, of your Schedule 1-A adjustments, with respect to voucher M-699.

A. Certainly there is.

Q. Then you did pay some attention to that voucher, Mr. Antonelli?

A. Well, in order to eliminate it, you do have to pay some attention. You make an adjustment to bring—to tie it up with the books.

Q. You told us just a minute ago, Mr. Antonelli—and the reason I inquired specifically here—you told us just a minute ago that you hadn't paid any attention at all to voucher M-699. I was trying to find out what the fact was.

A. I didn't pay any attention, as far as determining the original cost. I had to adjust it out and find the actual cost, and it is only natural. I can't understand what you are driving at.

Mr. MILDE. Well, you paid attention to it, to the extent of disregarding it?

The WITNESS. That is all.

Mr. SLAFF. That, I might observe, of course, is not a finesse with words—no.

Mr. MILDE. Well, it is what you finally brought out by your cross-examination, as I see it.

* * *

6334 By Mr. SLAFF:

Q. Do you consider it proper to increase the cost of the property purchased from an affiliate above the purchase cost; is that right?

A. Well, if I was determining the original cost and the purchase costs from the affiliate wasn't the original cost, naturally I would consider it improper that that is the cost.

Q. As I interpret your last answer, you consider it proper for an affiliate to make a profit on an acquisition; is that right?

A. Profit?

Q. Yes.

A. There is no profit involved here at all. How could there be profit? We are just getting to the original cost.

Q. Where do you propose to show the difference between purchase cost and original cost of those properties acquired from affiliates in the records which you are setting up on the Company's books?

A. That hasn't been decided yet.

6335 Q. Where do you propose to show it?

A. It doesn't make any difference. According to the code of accounts I will put it in 100.5. That is my personal idea.

Q. How do you propose to dispose of it after it is recorded in Account 100.5?

A. No one knows about that.

* * *

Q. What is that?

A. I don't know.

Q. You just don't know; is that right?

A. No. Nobody else does.

* * *

The WITNESS. I have no opinion.

6336 Q. Then you just don't know?

A. No.

Q. Of course you are not, Mr. Antonelli, disputing the fact that, with respect to these prior acquisitions, Hope recorded in its accounts the cost to Hope?

A. In some of the cases, like Clarksburg Light & Heat and Mountain State, they recorded the cost to the vendor, and then showed the difference in the depreciation reserve. In some properties they recorded the purchase price.

Q. The net effect of the Clarksburg and the other acquisition was to show the cost to Hope?

A. Yes.

* * *

6339 Redirect examination by Mr. MILDE:

Q. Mr. Antonelli, you were interrogated as to a 25 percent additional allowance over some Ford, Bacon and Davis unit costs that you used in making certain estimates on structural costs, do you recall that?

A. Yes, sir; I do.

Q. Well, what was the total amount of structural costs that you estimated in your $70,000,000 original cost estimate for items where you used these adjusted unit cost figures?

A. The total amount involved, that total amount of the amount that the Federal Power Commission Examiner excluded from their Exhibit 57, was approximately $100,000.

Q. And those were the only items in this $70,000,000 where you used these unit costs that you were interrogated about?

A. No; those are the dollars that the Federal Power Commission Examiners did not allow us.

Q. They did not allow $110,000 of estimates?

A. That is right.

Q. And those particular unit costs were not used in connection with any other estimates than these?

A. Well, they were used with an additional amount,
6340 about a hundred thousand dollars, which was allowed by the Federal Power Commission.

* * *

Q. Mr. Antonelli, referring to your Exhibit No. 60, let me ask you if the figures that you show for the various accounts are not an explanation or an itemization of the omitted property and costs of the figures appearing in column "H" of Schedule No. 2, of the Federal Power Commission Examiners Exhibit No. 75?

A. Yes, they are.

Q. In other words, taking the first item of $150.45 as shown in column "H" there, as amount disallowed by the Examiners, that is the $150.45 which appears on page 2 of your Exhibit 60?

A. That is correct.

Q. And so on, if we ran through all of these accounts, they would either be exactly or substantially the figures shown in column "H," would they not?

A. The difference would be the property used to transport coke oven gas which are not included in our Exhibit No. 60.

* * *

TRIAL EXAMINER. Ruling was reserved on Exhibits 59,
6341 69, 98, and 99. Was there any objection to those exhibits?

Mr. SLAFF. Well, I have what I might say is perhaps not an objection but something which I think the Examiner should take into consideration in ruling on the exhibit. If this Exhibit 60 is admitted into evidence, I think it should be admitted by the Examiner with the notation at the time of admission that the various headings and statements contained therein are very definitely misleading as they appear in the exhibit.

TRIAL EXAMINER. And as admitted by the witness.

Mr. SLAFF. That is correct. I think the nature of those—of the misleading character of those representations in the exhibit—has, I think, been brought out in the cross-examination of this witness. If the Examiner is to admit this exhibit in evidence, I think it should be done with a statement by the Examiner at the time of such admission so that in the future this exhibit won't stand just by itself in the record, and I do make that observation with respect to the exhibit.

Mr. MILDE. If the Examiner were to state with respect to each exhibit that he thinks this title or that title were misleading, we would never have a record here.

Mr. SLAFF. The reason I say that is because I really think that it is of sufficient consequence in this case so that,
6342 if an objection were pressed on that ground, it might be proper on the part of the Examiner to sustain such an objection.

Nevertheless, what would happen then, I presume, would be that the company would have to re-do the exhibit if it wanted to get it into evidence, and that is a considerable job—what the job might be worth is something else again—but it is a considerable physical job and I don't want to press the objection on that ground for that very reason; but I do think it a reasonable re-

quest to make that some notation be made at the time of admission into evidence of this document, if it is admitted, with respect to the representations made on the face of the exhibit itself in certain parts, and their misleading character in that respect.

TRIAL EXAMINER. Well, that probably would necessitate some little study of the exhibit and the record in order to determine just exactly what misrepresentations do appear in the exhibit, unless counsel has them in mind specifically right now.

Mr. SLAFF. Frankly, what I want to guard against is the fact that this exhibit may sometime be considered by itself without specific reference to that portion of the record where we took up, with Mr. Antonelli, what I, at least, conceive to be very definitely misleading portions of the exhibit, on its face.

Mr. MILDE. Well, may I call the attention of the Ex-
6343 aminer to this, that what Mr. Slaff is afraid of is the very reason—unwarrantedly—is the very reason that I asked Mr. Antonelli on redirect if it wasn't a fact that this Exhibit 60 is an explanation or a list of the omitted costs or omitted property costs of the figures appearing in column "H" of the Commission's Exhibit 65.

Now, you look at that exhibit and there can't possibly be any doubt, for example, that on the land accounts, the ——

Mr. SLAFF. Let me explain what I have in mind.

Mr. MILDE. Let me finish—that on the land accounts the Commission allowed a certain amount of money, as shown by their exhibit, and they have disallowed $150.45, which are the abstracting and recording costs listed in here. These two exhibits, one by the Commission's staff, and one by Mr. Antonelli, tie in together.

One is complementary or supplementary to the other, and there can't be any doubt that what is listed in Exhibit 60 is either the entire omitted cost of a particular structure, or certain portions of the cost.

Mr. SLAFF. Well, now, just take a look. I have before me that exhibit, and it is open to page 4, which is the first page of Account No. 23-2, and it certainly represents that there was excluded in the Federal Power Commission original cost exhibit, obtaining, recording, consideration, and abstracting, costs for every
6344 single one of the leases shown there on the exhibit. That is certainly what that page represents and Mr. Antonelli certainly, under cross examination, stated, that that is not what it was intended to represent by any manner of means.

Mr. MILDE. And I so stated at the time.

Mr. SLAFF. Sure, that is right. Certainly, to anyone who reads that portion of the record, that will be apparent, or one will know about it.

TRIAL EXAMINER. I don't think counsel for the company could complain of a ruling in accordance with the witness' own testimony, with respect to the exhibit.

Mr. MILDE. Oh, no. No, I just didn't want the Examiner to think that we would put anything in here that was intentionally misleading, and I made a statement at the time that we put these costs in here as a general heading, and dittoed them, and if we were doing it again we wouldn't do it that way.

Mr. SLAFF. Sure.

Mr. MILDE. Because, looking at it now, somebody might get a wrong impression.

Mr. SLAFF. I am not going into the motivation now, and the motivation isn't what moves me in making the statement I do, and the suggestion I do. It is simply so that the exhibit, on its face, will be clear, and if somebody goes to the place where
6345 it is received into evidence, if it is, and reads that portion, he will know what the fact is in that respect.

TRIAL EXAMINER. Exhibits 59, 98, and 99 are admitted into evidence.

(The documents referred to were received in evidence as Exhibits 59, 98, and 99.)

TRIAL EXAMINER. Ruling will be reserved on Exhibit 60.

6686 **TESTIMONY OF F. P. C. WITNESS GOUGH ON HOPE WITNESS' MISINTERPRETATION OF GOUGH'S REBUTTAL OF "TRENDED ORIGINAL COST"**

Transcript Pages 6686–6734

* * *

Mr. SPRINGER. Mr. Examiner, we are presented with an unusual situation, in that the company didn't choose to cross-examine Mr. Gough relative to Exhibit 74 which was his report on Mr. Antonelli's original cost trended, nor to call Mr. Antonelli to the stand to rebut the criticisms or trending of original cost, which Mr. Gough's exhibit is, but the company had Mr. Rhodes testify in that connection.

In his testimony, Mr. Rhodes has said a number of things, in connection both with Mr. Antonelli's Exhibit No. 20 and Mr. Gough's Exhibit No. 74, which are untrue, and I believe that the progress of the case would be expedited if I were to have Mr. Gough take the stand to comment upon several of the answers which Mr. Rhodes gave during the course of his testimony on Wednesday, July 16, 1941, and Mr. Gough will confine himself to Mr. Rhodes' statements, and nothing new is presented here.

6687 TRIAL EXAMINER. Mr. Gough should confine himself to a direct answer to Mr. Rhodes' statements.

Mr. SPRINGER. Yes.

TRIAL EXAMINER. And not bring up any new matter.

Mr. SPRINGER. That is the purpose of presenting Mr. Gough at this time in surrebuttal of Mr. Rhodes rebuttal.

Mr. MILDE. Of course, the proper way to develop any errors in Mr. Rhodes' statement is by cross-examination of Mr. Rhodes.

TRIAL EXAMINER. That is quite true.

Mr. SPRINGER. Of course, I made a statement at the time that I found Mr. Rhodes to be an evasive witness and I am unable to get him to acknowledge misrepresentations that he has made.

Now, my only resort is to bring the man who made the study, Exhibit 74, and let him point out where Mr. Rhodes misquoted

him. We are certainly entitled to that in the course of procedural due process and a fair trial.

Mr. MILDE. I think we are also entitled not to have the counsel for the Commission make an inaccurate statement as to the testimony of one of our witnesses. Just because he doesn't answer what Mr. Springer thinks he ought to answer doesn't make him an evasive witness.

Mr. SPRINGER. That is just my opinion. It doesn't necessarily have to influence the Examiner or you or anybody
6688 else.

TRIAL EXAMINER. Well, of course, in so far as Mr. Rhodes may have misquoted the witness, that might very easily have been developed on cross-examination, but when it comes to an erroneous interpretation of this witness' statement or testimony, I think it is very doubtful that that could be properly developed on cross-examination.

Mr. SPRINGER. That is my point, Mr. Examiner.

TRIAL EXAMINER. Well, go ahead.

VICTOR G. GOUGH, called as a witness, having been previously sworn, resumed the stand, was further examined and testified as follows:

Direct Examination By Mr. SPRINGER:

Q. Mr. Gough, were you present and did you hear the testimony of Mr. Rhodes on Wednesday, relative to Exhibit 74 which is your report on original cost trended, which was originally Mr. Antonelli's Exhibit 20?

A. I was and I did.

Q. Are you prepared to answer certain questions in connection with the testimony that Mr. Rhodes gave?

A. I am.

Q. I refer you to page 6229 of the transcript in which
6689 Mr. Rhodes stated that you developed a trending method to trend the company's original cost. Did you do any such thing?

A. I did not.

Q. What did you do——

Mr. MILDE [interposing]. Just a moment. If we are going to have any reference to Mr. Rhodes' testimony, will you state it accurately in the record by reading it?

Mr. SPRINGER. Do you have page 6229 before you, Mr. Milde? Do you have it before you?

Mr. MILDE. Yes; I have a copy of it.

Mr. SPRINGER. Don't you see that Mr. Rhodes stated that he thought Mr. Gough developed a trending method to trend the company's original cost. That is obvious, isn't it?

Mr. MILDE. This is the direct statement. It begins at page 6228 of the record.

Question to Mr. Rhodes: "Mr. Rhodes, are you familiar with the methods used by Mr. Antonelli in determining his trended original costs in Exhibit 20?

"Answer. I am.

"Question. Have you also studied the trending methods suggested by Mr. Gough of the Commission's Staff in Exhibit 74?

"Answer. Yes.

"Question. Will you compare these two methods,
6690 generally?

"Answer. Mr. Antonelli's methods express original cost in 1938 dollars and Mr. Gough's methods, if carried to completion would reflect, in addition, 1938 construction conditions and methods."

Mr. SPRINGER. Well, what else can that mean except that Mr. Rhodes stated Mr. Gough developed a trending method to trend the company's original cost?

TRIAL EXAMINER. I think it would be well to develop this witness's testimony on the basis of what was said. If it is a matter of interpretation, everybody makes his own interpretation and I don't know where we are going to end up.

Mr. SPRINGER. All right.

By Mr. SPRINGER:

Q. On the basis of the statement read from the transcript by Mr. Milde, what is your answer to Mr. Rhodes comment?

A. What I did was to examine Mr. Antonelli's trending and by tests found that it had not taken into account the improvement in labor productivity per man-hour and, in one major instance at least, that the trending factors for material costs were based upon data not representative of the charges to which they were applied.

Mr. MILDE. I move that that answer be stricken as not responsive to the question or the line of direct examination. He is
6691 supposed to state some inaccuracy in what Mr. Rhodes said about his methods.

Now he is going on to repeat his direct testimony as appearing in Exhibit 74 as I understand it.

The WITNESS. Mr. Examiner, at page 6229, the phrase "Mr. Gough's methods" appears 4 times, both from the mouth of Mr. Rhodes and from the mouth of counsel, and I developed no method for trending original cost.

Mr. MILDE. All right, that is your statement. That is sufficient.

By Mr. SPRINGER:

Q. Now, Mr. Gough, I call your attention to the statement of Mr. Rhodes on page 6230, and I quote: "First he assumes that all the improvements in effective labor productivity were due to methods of construction." Did you assume any such thing?

A. I did not.

Q. What did you do?

A. Using Mr. Antonelli's revised original cost and his labor rates I developed the fact that there has been an improvement in labor productivity per man-hour and that this impeached Mr. Antonelli's trending.

Q. Was it necessary for you to determine the reason for the general improvement in labor productivity?

A. No. A demonstration of the fact that there had been such an improvement was sufficient for my purpose.

6692 I might add, however, that aside from the peculiarities that relate to any single construction job, there are two general factors which tend to improve labor productivity per man-hour. They are (1) more efficient methods of construction——

Mr. MILDE (interposing). I object. Let me interrupt you. I object to the qualifications of this witness to answer that question from here on. He is purely an accountant. He is not an engineer and he is going on in answer to Mr. Springer's question.

Mr. SPRINGER. Just a minute. He made an analysis of the company's experience and, if anything, found that there was an improvement in productivity per man-hour of the company's own man power, when hours were shorter under modern conditions, and the technology of the machine age was at the disposal of the man power of the Hope Company in modern times.

TRIAL EXAMINER. Go ahead, finish your answer.

The WITNESS (continuing). And (2) shorter hours of labor. The displacement of the ox, which was referred to as a means of hauling pipe earlier in this case, by the automobile obviously speeds up construction. The shortening of the work week from 72 hours to 40 hours also makes the hour of work a more productive one, for long hours of labor go hand-in-hand with low productivity.

6693 By Mr. SPRINGER:

Q. Didn't you just make a statistical study of the Hope Company's experience on labor productivity?

A. I did.

Q. That doesn't require any engineering knowledge, does it?

A. Well the thing that Mr. Milde objected to, that more efficient methods of construction improved productivity, is the objection to a platitude, you might say.

Q. That is common knowledge——

A. (interposing.) Because it is obvious that if you are more efficient, that is what efficiency is.

Q. At the same page——

Mr. MILDE (interposing). Which page?

Mr. SPRINGER. 6230.

(Continuing.) Mr. Rhodes says that Mr. Antonelli developed his pipe price trends from actual purchases of pipe by the company over the years?

Did you find this to be true?

The WITNESS. I found that in addition to using actual prices he also used estimates where no purchases of a particular size were made. For example, from 1915 to 1938, I understand—and I believe it is in this record—that there were no purchases of 2-inch pipe and that an estimate was used.

6694 By Mr. SPRINGER.

Q. Now, at page 6231 of the transcript Mr. Rhodes states that you "based your study on book cost, calling it original cost." What did you do?

A. I based my study chiefly on Mr. Antonelli's revised original cost. I did this for the reason that it was Mr. Antonelli's figures I was testing and the best test of the accuracy of his method was to use his own figures for that purpose.

Q. Now on page 6232 of the transcript Mr. Rhodes compares your figure of $2.80 per foot to trend in 1938 with his reproduction cost of $2.84. Was Exhibit 74 made for the purpose of exposing fallacies which might lie in Mr. Rhodes' reproduction cost new?

A. No, it was not. My task in that exhibit was to demonstrate the unreasonableness of Mr. Antonelli's trended results. That was the fly in the ointment that we were fishing for, and when one hauls it out and examines it, he finds that Mr. Antonelli trended well construction to $34,384,320—or to $4.30 per foot. This result

is obtained by using Mr. Rhodes' own figures of approximately 8,000,000 feet of aggregate depth of all wells. It is to be noticed that Mr. Antonelli's figure is a little over 50 per cent higher than Mr. Rhodes' figure of $2.84

6695 Q. In Mr. Rhodes testimony on the same page 6232 of the transcript, he compares your figure with his, apparently as a means of confirming his figure. Are your figures properly used for that purpose?

A. No, they are not.

Q. Why not?

A. My tests of Mr. Antonelli's trending did not extend to the reasonableness of his 1938 prices. In other words, I accepted them. Had I been critical of them, my first complaint would have been that they, assertedly based on company prices for 1938, represent a very small part of total plant. Page 98 of Exhibit 20 shows 1938 additions to plant to be $860,725 of total plant of $70,553,439, a ratio of about 1.2 per cent. Obviously, therefore, these prices which I accepted for the purpose of my exhibit are not properly usable as reproduction cost new prices, for it is apparent that prices representative of a little more than one per cent of the plant are no indication of what prices would be were the entire plant to be reproduced in 1938.

Q. Now, on page 6232 of the transcript Mr. Rhodes states also that you selected lines for the purpose of table 13, and that it is a partial list of lines. Is that a correct statement?

A. No. Page 35 of Exhibit 74 states what it represents. The analysis contains the cost of every job in the company's
6696 mains lines inventory ledger with the exception of those for which data could not be readily interpreted.

The jobs analyzed represent more than 3,000,000 feet of main and $3,000,000 of cost. This is a sizeable portion of all the company's mains construction costs which on December 31, 1938, according to Exhibit 20, were $5,266,108. Of course, the costs by lines jump up and down probably because of construction conditions, such as weather, terrain, and size of job. For this reason the over-all picture is better to be seen from table 14 which summarizes the averages for each size and period.

Q. And when you speak of table 14 do you mean Exhibit 74?

A. Table 14 of Exhibit 74.

Q. Mr. Rhodes testified on pages 6234 to 6235 of the transcript about conditions encountered in building pipe lines. What

have you to say about his comment in reference to your exhibit on that?

A. As I stated in the text of my report, and as Mr. Rhodes observes, it is hazardous to make comparisons of the cost of one pipe line with another. The construction of a pipe line is often surrounded by circumstances peculiar to it and perhaps almost every pipe line may be called a typical in some respect or other.

For this reason it is desirable to analyze large amounts of
6697 construction costs representing many feet of pipe and that has been done as table 14 indicates.

Q. Of your Exhibit 74?

A. Of Exhibit 74.

We believe the percentages of increase of production per man-hour shown on that table definitely indicate a tendency towards improved labor effectiveness.

Q. Now, Mr. Rhodes combined labor study of mains construction jobs to get an over-all figure. Why did you not combine your labor study of mains construction jobs to get an over-all figure in the manner that he did?

A. It would have complicated the method of my comparison and would have introduced a controversial point. My comparison has the advantage of showing like size compared to like size without raising any question as to the validity of a formula, and furthermore when the results by sizes are all examined it will be seen that they tend to confirm one another.

Q. At page 6238 of the transcript, Mr. Rhodes explains calculations he has made on an "inch-feet per man-hour" basis. Did you have the opportunity to check them?

A. No, I did not. I expected to go on yesterday and the papers were made available to me the day before at an hour and on conditions that didn't permit me time to examine them.

Q. Now, at page 6241 of the transcript, Mr. Rhodes states that he used the same wage rates that you used to find
6698 year by year the total man-hours required. Did you develop these wage rates to which he refers or did Mr. Antonelli develop them?

A. They are Mr. Antonelli's.

Q. On page 6242 of the transcript, Mr. Rhodes states "so that trending original cost, as Mr. Antonelli had done, in the light of an unchanging labor performance, really arrives effectively at the contract price in the field." Did Mr. Antonelli pay any

attention whatever to labor performance in the development of his trend factors?

A. No; he did not.

Q. At page 6242 of the transcript and 6243, Mr. Rhodes states that table 11 of your exhibit 74 is not a complete list. Is his statement true or untrue?

A. It is untrue. The amounts of $580,155.05 and $719,878.09 shown on pages 31 and 32 respectively of Exhibit 74 are exactly what they purport to be, namely an analysis of Mr. Antonelli's entire original cost revised for the years indicated, exclusive of overheads. Table 10 of Exhibit 74 shows these amounts with overheads added and they agree to the penny with Mr. Antonelli's original cost as shown on page 82 of his Exhibit 20. The difference between Exhibit 11 and 13——

Mr. MILDE (interposing). Do you mean table 11?

The WITNESS. Table 11.

6699 A. (Continuing.) and table 13, which Mr. Rhodes talked about is readily explainable.

The WITNESS. He raised a question as to these two tables not agreeing.

Mr. MILDE. Well, I think we ought to be fair to Mr. Rhodes and have his complete statement in the record. What it says is that these lists are not complete because of the omission of several sizes of pipe. One table omits some sizes and the other table includes them.

The WITNESS. Well, I can clear that up very readily.

Mr. MILDE. You don't deny that that is a fact, do you?

The WITNESS. Yes; I do deny it.

Mr. MILDE. That one of your tables omits some sizes and the other one includes them?

The WITNESS. Well, I do not deny that they are in one table and they are not in another, but when you use the colorful "omits" in it, I can't agree with you, because when you consider what I am doing, I don't omit anything. I have taken the company's records as they are and there is a very good explanation for the difference. The difference between table 11 and 13 which Mr. Rhodes talked about is not due to an error as Mr. Rhodes seems to imply. Exhibit 11 is an analysis of the mains

6700 construction existing in plant on December 31, 1938——

By Mr. SPRINGER:

Q. You mean table 11?

A. Table 11. (Continuing.) Whereas table 13 is a tabulation of the construction that the company has undertaken, whether retired or not. Obviously, if the 325,000 feet which Mr. Rhodes refers to at page 6243 is not in the plant as of December 31, 1938, it has been abandoned or otherwise disposed of, or Mr. Antonelli's records from which I took the data is in error.

Q. Does this explanation also apply to Mr. Rhodes observation concerning 162,000 feet of 12-inch pipe?

A. It does.

Q. On the transcript page 6243?

A. Yes, sir; it does.

Q. So that the lack of coordination, which he complains about, arises from the fact that you have presented a full picture, namely, a comparison of construction costs in the plant existing at December 31, 1938, and also a comparison of costs whether still existing in plant or not?

A. It does, and it is improperly called a "lack of coordination."

Q. Then it does not indicate that you have made elective choices?

A. Positively not.

6701 Q. At page 6244 of the transcript, Mr. Rhodes refers to your comparisons as "an inadequate sample." Did you sample the company's mains construction cost or did you present the complete analysis of those costs?

A. I presented as complete an analysis as possible for the three important sizes chosen for my study. It represents more than 50 percent of all the mains construction that the company has ever made.

Q. The analysis presented in your table 11 of Exhibit 74, represents how many feet of 10-, 12-, and 20-inch construction?

A. 3,294,595 feet.

* * *

By Mr. SPRINGER:

Q. Will you turn now to the page 78 of your Exhibit 74, which is a copy of a schedule taken from the company's financial statement of December 1938, and which shows the number of feet of main lines pipe by dimensions as of December 31, 1938, and will you add the number of feet of 10, 12, and 20-inch pipe shown on that schedule, and tell me the total number of feet of those three sizes?

A. 3,459,646 feet.

Q. Do you know the total amount of mains' construction abandoned and retired?

A. I am told by Mr. Dunn that it is less than $1,000,000.

Q. So that your tabulation in table 13 of Exhibit 74
6702 can not properly be called an inadequate sample?

A. I think not. I might add that that $1,000,000 I referred to is all of the mains that have ever been abandoned by the company.

Q. At page 6246 of the transcript, Mr. Rhodes states that you applied a general over-all trend to individual purchases of pipe. Is this your method or Mr. Antonelli's method?

A. It is Mr. Antonelli's method. He applied a general over-all trend to pipe and for the purpose of disproving his answer I obviously had to follow in his footsteps. It is true that such an application to an individual purchase might be misleading, but when every purchase to the number of 61, with the exception of only one, which was a distress sale of pipe, gives the same answer, namely, that Antonelli's prices exceed Rhodes' prices, only one conclusion can be drawn.

Q. Mr. Rhodes also stated that your individual purchases are not a good criterion and that you should have taken a cross-section of all the purchases. What did you do?

A. Information for all important purchases of pipe greater than eight inches in diameter which could be obtained in the aggregate amount of $7,808,500, in shown in table 16 of Exhibit 74.

Mr. MILDE. What page?

6703 The WITNESS. 47 and 48.

By Mr. SPRINGER:

Q. Of Exhibit 74?

A. Yes. Pipe greater than eight-inch pipe was taken because it was the trending of the larger sizes specifically that was being tested. When it is recalled that the original cost of all pipe that the company has ever had in its Mains Equipment Account, of all sizes, is, at the outside, using Mr. Antonelli's figures, not much greater than $11,000,000, the term "individual purchase," as applied to $7,808,500 worth of pipe, is a misstatement.

Q. Again at page 6246 of the transcript, Mr. Rhodes states that "Mr. Antonelli investigated all the purchases made by Hope over the years and developed from the actual prices paid the cost over the years." Did Mr. Antonelli use the costs of

pipe greater than eight inches in diameter in developing his trend?

A. He did not.

Q. And what part of the Mains Equipment account, as it existed at December 31, 1938, consisted of mains greater than eight inches in diameter?

A. About 95 per cent of it.

Q. So that Mr. Antonelli's pipe cost trend was developed from costs of pipe of sizes which in money amounted to only about 5 per cent of the account as of December 31, 1938?

6704 A. That is correct.

Q. At page 6247 of the transcript, Mr. Rhodes testified that "the reproduction cost new price of pipe is approximately 20 percent lower than Mr. Antonelli's trended prices." True or false?

A. False.

* * *

A. Pages 47 and 48 of Exhibit 74 show percentages of the excess of Mr. Antonelli's pipe cost as trended over Mr. Rhodes' pipe cost far in excess of 20 percent, and these excesses were developed by comparison with the pipe prices in Rhodes' appraisal before deducting 10 percent for quantity purchases.

If you add to these percentages the 10 percent quantity reductions which are not taken into account in Exhibit 74, there are only five purchases out of the 61 that are less than 20 percent. Most of them run very much higher than 20 percent, as a glance at column "L" of table 16 shows. The highest is 73 percent in excess of Rhodes and others are similarly high.

Q. The prices which appear in column "J" of table 16, on pages 47 and 48 of your Exhibit 74—is that right?

A. Yes, sir.

6705 Q. (Continuing.) Were taken from what source?

A. They are the unit costs per foot for material taken from pages 260 and 261 of table 16, part "D"——

Q. (Interposing.) You mean Exhibit 16?

A. Exhibit 16, part "D" which is Mr. Rhodes' reproduction cost new of the company's property as of December 31, 1938.

Q. And after Mr. Rhodes had applied these prices to the quantities of pipe for each size in his appraisal he made an over-all deduction of 10 percent for wholesale purchases, did he not?

A. He did, and that is shown on page 259 on Exhibit 16, part "D."

Q. But the prices shown in column "J" of table 16 at pages 47 and 48 of Exhibit 74 are ten percent higher than they would be if Mr. Rhodes' ten percent reductions were taken into account?

A. They are ten percent lower than they would be if Mr. Rhodes' ten percent had been taken into account.

Mr. SPRINGER. Will you read the question.

(Whereupon, the pending question, as above recorded, was read by the reporter.)

A. I heard your question, and they should be ten percent—they are, as they stand, ten percent lower than they would be.
6706 Oh, excuse me. The prices. The prices are higher. That is correct. I misspoke myself.

Q. Well, doesn't it follow that, if Mr. Rhodes took an over-all ten percent deduction on the prices——

A. (Interposing.) Afterwards.

Q. (Continuing.) Afterwards, that the prices that were used for your study of trended original cost are ten percent higher?

A. That is correct. I misspoke myself.

Q. At the foot of page 6247 of the transcript, Mr. Rhodes, in commenting upon Exhibit 74, states that "the other explanation is that, in reproduction cost new, I took a lump sum over-all ten percent discount below the manufacturers' quotations, less usual discounts, so that we would expect pipe trends based on actual cost to be higher than reproduction costs on a similar basis——"

Mr. MILDE. Well, why don't you finish the sentence?

Mr. SPRINGER. "Namely, without overheads, and such proves to be the case."

By Mr. SPRINGER:

Q. Is this a true explanation of the percentages of difference which appear in column "L" of table 16 of Exhibit 74?

A. No. It is not, for the reasons that I have just given.

Q. At page 6248 of the transcript Mr. Rhodes said, "Now
6707 some of the items listed in Mr. Gough's tables show a greater than 20 percent and some show practically no difference at all, but they all wash out to approximately the 20 percent difference which I have just described, by comparison with the over-all figures." What do you have to say of this explanation of the difference?

A. It is a false explanation of the definition of what the comparison shown in table 16 of Exhibit 74 indicates. This can be seen by a casual examination of column "L" of table 16 of Exhibit

74 especially if the additional ten per cent on quantity purchases is kept in mind.

Q. Does that conclude your comments upon the statements made by Mr. Rhodes or the interpretations made by Mr. Rhodes of your Exhibit 74?

A. Yes, sir; it does.

Mr. SPRINGER. That is all.

* * *

Cross-examination by Mr. MILDE:

Q. Mr. Gough, referring to your last statement, you don't quarrel with Mr. Rhodes' figures, do you, that if you take the columns "K" and "L," I believe on table 16, that if you add up all the figures and compare the lump sum differences, that the
6708 prices, as you show them for Mr. Antonelli and Mr. Rhodes are approximately 20 per cent difference. You don't quarrel with his mathematics on that, do you?

A. No; I am not quarreling with the mathematics of that.

Q. Did you make that calculation?

A. No; I did not.

Q. I see. Your comment isn't based on the mathematics of it, but on some other things that you expressed in your direct testimony?

A. Yes. It is based also on another comparison that I made of the Rhodes prices for 2, 3, 4, 6, and 8 inch pipe which was used as the basis of his trending, as compared with Antonelli's prices for 1938, and that difference was 14 per cent. If you added to that 14 per cent the 10 per cent over-all quantity discount, you get 24 per cent which would be something higher than Mr. Rhodes.

Q. Well, you recognize that Mr. Rhodes' reproduction cost new prices as he used them are substantially below the prices actually paid by the company in 1938?

A. Well, I haven't made any examination of Mr. Rhodes' reproduction cost appraisal. I wouldn't care to comment on it one way or the other.

Q. Well, you made a sufficient examination to develop your table 16 that you have been talking about, haven't you?

6709 A. Maybe I misunderstood your statement. I thought it led to comment by me on Mr. Rhodes' reproduction cost appraisal. May I have the question?

* * *

(Whereupon, the pending question, as above recorded, was read by the reporter.)

A. I couldn't answer that, because I haven't compared them. His prices were below the prices used by Antonelli for these low sizes of pipe. I stated that and, of course, Antonelli's prices included, at least for the 2-inch, an estimate.

By Mr. MILDE:

Q. For 1938?

A. I think so; yes. I don't think the company purchased any 2-inch pipe in '38 or for a number of years prior to that.

Q. Well, do you know what prices Mr. Antonelli used for his 1938 prices in making his trending?

A. Yes; he used 2, 3, 4, 6, and 8-inch pipe.

Q. I mean, what prices they were?

A. For what period and whose prices?

Q. Yes.

A. They were the prices that the company paid.

Q. They were the prices that the company actually paid
6710 in 1938—that is, the average for 1938 purchases—were they not?

A. Yes. If they paid such—if they made such purchases. Now ——

Q. (Interposing.) Well, I think you have answered my question.

A. I am looking at a table that gives these 2-inch pipe prices and it is a very bad reproduction, that I referred to when I introduced the exhibit, and now I am having trouble with it because I am looking at page 75 ——

Mr. SPRINGER. (interposing). Of Exhibit 74?

The WITNESS (continuing). Of Exhibit 74 and I can't distinguish whether his indication is that that is an estimated price or not.

By Mr. MILDE:

Q. Well, there is no note opposite it indicating that it was either obtained from the Peoples Company, or was a trended cost, is there?

A. Well, there is a narrow line running down there. It doesn't seem to include '38 but I wouldn't be sure of it.

Q. Now, with reference to your comments about selection of lines, Mr. Gough, which of your tables on line construction is the most comprehensive?

A. Tables 13 and 14, which are really to be taken
6711 together, is more—includes more pipe line construction than table 11.

Q. Tables 13 and 14?

A. Yes, sir.

Q. Now, turning to table 14, will you tell me why you omitted 16-inch pipe from this comparison or determination, or whatever you call it?

A. Yes. Let me say this first, Mr. Milde, that every test that I made in this study I have included—that is, I haven't made tests which I excluded. When I made the study I was assigned to the study singly. I had no help. I was fortunate in getting assistance of a couple of the men at Clarksburg in their off time from their regular jobs, and I was faced with the difficulty of trying to get an over-all view of this picture without a tremendous amount of detailed work, so that I chose three sizes, and I chose sizes that I thought would be representative.

Q. Well, Mr. Gough, do you know that there is a very substantial amount of 16-inch pipe in the company's inventory?

A. Yes; there is.

Q. And you didn't in this comparison, use any 8-inch pipe, did you?

A. No; I used only 3 sizes out of a number of sizes.

Q. Well, is there more difference between the installation
6712 of 10 and 12-inch pipe than there is between 8 and 12 or 16 and 20?

A. No; I can hasten to say that if I had had time to make the entire study, it would have been more satisfactory than picking out three sizes. I was faced, as I say, with the problem of doing this work with the resources at my disposal and at the same time trying to get an answer that would be fair, and I feel that I accomplished that.

Q. Well, why did you start with 1905?

A. That was the first year that we had any record of those sizes. We took the books from the very beginning, 1898, and we listed every job that we could, and that was the first year that we got that—that one of those sizes appeared.

Q. And I suppose the reason that you eliminated H–1, which was the first line built by the Hope Company in 1899, was because that was 10-inch rather than one of these sizes that you selected?

A. It was 10-inch, you say?

Q. Ten inch; yes, sir. 10¾ inch, O. D.

A. I don't think we would have eliminated it for that reason, Mr. Milde. I just can't, at this late time—unfortunately, Mr. Whitney, who helped me with the details is no longer here. I just can't tell you why we didn't accept that, whether the details weren't available in sufficiently good shape or what the reason was.

Q. Well, perhaps that was because it was installed in
6713 1899 rather than in 1905?

A. Oh, no. We started from the very beginning.

Q. I see. Well, then, can you tell me now why you omitted lines H–2 and H–8, both 12-inch pipe and totalling some 150,000 feet, H–2 being installed in 1905 and H–8 in 1904?

A. The reasons must have been that the detailed information on those jobs was not in such form that we could use it.

Q. Well; you don't really know about that, do you?

A. Well, I know that we took everything. You are asking me now—that job was done a long while ago and the man who worked on that particular detail is not here, but I am sure that is the reason.

Q. Well, you don't deny Mr. Rhodes' statement that all sizes and all lines have not been studied in your exhibit or analyzed in your exhibit?

A. Oh, no; there is no question about that.

Q. Before we go on I wish you would explain your statement that you didn't have time to examine Mr. Rhodes' working papers. Is that what you meant?

A. Yes. Well, it is simply this: that when Mr. Rhodes left the stand the other day, I had those papers for about an hour I had to go upstairs and didn't have the opportunity to reach them.

Q. Well you know we had them here for you the next day?

6714 A. Well, I will tell you the whole story and that will finish it.

Q. Now——

A. (Interposing.) Well, let me tell you the whole story.

Q. All I am interested in knowing is: you don't say we didn't give you an adequate opportunity to check over those figures?

A. That is exactly what I do say.

Q. All right, then, you better tell your whole story.

A. At 4:30 one of his assistants appeared at my office and asked me for the papers so that I didn't have them that evening.

Q. How long had you had them that day?

A. About one hour.

Q. And how many papers were there?

A. There weren't many, but I had other things to do when I left the hearing room.

Q. So you had them an hour and you didn't look at them?

A. That is right.

Q. All right, proceed.

A. The next day I sent one of my assistants down here in the morning and they were not here—they were over at the
6715 hotel—and he accompanied Mr. Rhodes over to the hotel and Mr. Rhodes declined to give him the papers, and they appeared with the papers at my office, I think, about a quarter to two, and they wouldn't leave the papers there. They wanted to give us copies of them. Well I just—by the time copies were made, or they copied them, I wouldn't have had time to prepare myself to go on the stand—as I thought, the next morning, which was yesterday—and so I simply didn't choose to delve into the matter at all, rather than look at them hastily.

Q. And the fact is that we offered to make copies for you, isn't it?

A. At a quarter to two.

Q. When?

A. On Thursday.

Q. On Thursday?

A. Yes.

Q. And today is what?

A. Today is Saturday.

Q. Now, Mr. Gough, you made some comments about productivity. Are you an engineer?

A. No, sir.

Q. Have you ever constructed a pipe line?

A. No, sir.

Q. Have you ever done any construction work?

A. No, sir.

6716 Q. And is it your view that there is more or less lost motion, so far as man-hours of labor are concerned, under present working conditions, when you knock off after 8 hours, rather than the old days when you worked ten and twelve hours steadily.

* * *

A. I think that the man who works long hours in employment does less because, for several reasons—does less per man-hour—he is more susceptible to illness and the time that he is ill is unproductive time. He has to be excused more often because his free time is frequently not sufficient for his personal needs, and, obviously, he is subject to greater fatigue, and that is cumulative because the long hours give him less time to——

By Mr. MILDE:

Q. (Interposing.) For recreation?

A. No. To refresh himself. Because if he goes out and has recreation, he is liable to do less than if he didn't.

Q. And is that all?

A. Well, that is one of the features of the long day.

Q. I see. And that is what you based your opinion on in this case?

6717 A. Well, I wouldn't say that I based my—I think my opinion in the matter is immaterial. The facts speak for themselves. I was interested in looking up the problem of productivity and I think it is one of the amazing things of our age, that in the last 15 or 20 years there has been the tremendous increase in productivity in practically every industry.

Q. Now, Mr. Gough, what study have you made of the laborers down in the hills of West Virginia? Do you think they are more or less healthy and get time off if they work 10 or 12 hours a day rather than 8 hours?

* * *

Mr. SPRINGER. Mr. Gough said that he studied the company experience on labor performance and Mr. Milde has not kept within the scope of his examination, but he listed an opinion of Mr. Gough's, which he happens to have based upon

6718 his studies of the phenomenon of greater labor productivity under shorter hours and modern working conditions than in the earlier part of this century.

Mr. MILDE. Of course, if Mr. Rhodes developed the results that Mr. Gough achieved, it would not show that you get greater productivity in West Virginia.

I want to develop the basis for Mr. Gough's opinion as to why there should be greater productivity. Not in some garment factory in New York or in some tooth paste manufacturer in New Jersey, but the men working down in West Virginia.

That is what we are concerned with here. I want to know and I am entitled to ask him whether he has made the slightest

study of these conditions as he has described them, as applied to the West Virginians who actually work in these pipe lines.

Mr. SPRINGER. The point is that he took the company's actual experience. Can't we confine our examination to that?

* * *

6719 Mr. MILDE. Is there an unanswered question on the record?

(Whereupon the pending question, as above recorded, was read by the reporter.)

TRIAL EXAMINER. As I understand, this witness testimony and his exhibit are confined to man-hour productivity, as shown by the books of the company.

The WITNESS. [Nodding.]

TRIAL EXAMINER. But based on his opinion as to the productivity of labor in that immediate territory or in any other parts of the United States?

Mr. MILDE. Well, as I understood it, on Mr. Springer's direct examination, he ventured some opinions that of course it was a mere platitude that labor is now more productive than it was in the earlier days, and that is what I am examining him about.

TRIAL EXAMINER. Are the conclusions he arrives at in his exhibits based, to any extent, on that opinion?

The WITNESS. No: they are not based on opinion: they are based on the facts as recorded in the Company's books and in Mr. Antonelli's studies.

By Mr. MILDE:

Q. As you interpret them?

A. Well, it is an interpretation like 12 divided by 3 is 4. That is the kind of interpretation it is.

6720 Mr. REEDER. Mr. Examiner, I submit that the question which counsel asked this witness on cross-examination, having gone outside the scope of the direct testimony, calling for an opinion, which was primarily an engineering opinion, counsel is bound by the answer of the witness and not entitled to cross-examine him further about it. He made him, for this purpose, his own witness, and he can't cross-examine him, and he has no right to be surprised by the answer that he got.

TRIAL EXAMINER. Objection sustained.

By Mr. MILDE:

Q. Well, Mr. Gough, you didn't test the results of your figures, as you show them in your Exhibit 74, as to man-hour produc-

tivity, by any engineering study or analysis or industrial study of labor conditions in West Virginia, as they are applicable to the building of pipe lines from 1898 on?

A. No; I did not. I used only the facts as they relate to the Hope Company.

Q. And just what did you mean by man-hour productivity? Isn't it a fact that that is a computed figure?

A. It is the result of a computation: yes. You take the units of work that are done, the cost of doing that work, the number of hours spent in doing the work, and out of those facts you get the productivity.

6721 Q. Well, you didn't actually ascertain the hours that were spend in doing the work, did you?

A. I ascertained the hours that were spend doing the work, pursuant to Mr. Antonelli's formula, which is this: If you spend a hundred dollars for labor and you pay men on an average 25 cents an hour, it is self-evident that you have gotten 400 hours of labor for that hundred dollars.

Q. Well, will you point to any place in Mr. Antonelli's exhibit where he used a formula of that sort?

A. Well, his whole trending is shot through with that. That is the way the labor is trended. He takes the money and he says that the average rate at which that money was spent was 25 cents or 50 cents an hour, whatever it is.

Q. Well, he never determined the hours of labor for various lines in the—over the course of the Company's history?

A. He didn't do it for various lines. He did it over all by years for each account.

Q. Do you mean to say that anywhere in his exhibit or in his working papers he determined the hours of labor expended in constructing the Company's property?

A. No. If I gave that impression, I am mistaken. Mr. Antonelli wasn't interested in hours, but it follows that if he says the labor rate for so much money was such a rate, there

6722 can be no other answer than that that represents so many hours of labor.

Q. Mr. Gough, will you turn to Page 31 of your exhibit and take your first item of 10-inch line in 1911, installed in 1911, where the original cost, exclusive of overheads, is shown as $8,106? Then, isn't this what you did: You took the average hourly wage rate of 21.9 cents, as shown in your Column E, and divided that into the $8,000 to get man-hours expended?

A. That is exactly what I did.

Q. And that doesn't indicate how many hours of labor were actually required to build that line, does it?

A. No. It is not an actual figure. It is a derived figure.

Q. And you don't know whether it took actually 16,000 hours or 40,000 hours?

A. No.

Q. That is just the computation to get some sort of a factor?

A. Yes; it is a computation like Mr. Antonelli's original cost trended is a computation, and it doesn't violate any of the assumptions that Mr. Antonelli has made.

Q. And nowhere in your exhibit do you actually show how many hours of actual labor it took to install any of the Company's lines, either early in its history or late in its history, do you?

6723 A. No; except as derived by this formula.

Q. And if you wanted some completely accurate data as to how much work a West Virginian pipe-liner could do in 1938, as compared with what his father did in 1910, you would have to make some time studies, wouldn't you?

A. You mean—well, that is on the assumption that the Company book costs are not correct, or that the rates that Mr. Antonelli used are not correct?

Q. Not at all.

A. Well, no, I think that the best indication, assuming that Mr. Antonelli's costs are correct, and that his labor rates are correct, if you divide his cost by his labor rate, you will get the number of hours expended. Otherwise he has got a mistake somewhere.

Q. Yes; but you don't get the hours expended, Mr. Gough; you just admitted that. You don't know whether those are the actual hours of labor expended or not?

A. No; I didn't say they were the actual hours expended. I say, you get the hours as I have shown them by that method. Now, if Mr. Antonelli's original cost is wrong, or if his labor rate is wrong, then the answer is wrong. If the money spent is right, and if the wage rate is right, the hours have to follow, like night and day, as being correct.

Q. Well, Mr. Gough, isn't it perfectly apparent that 6724 you have got a lot of other costs besides labor costs?

A. In the labor accounts?

Q. Sure. You have got the use of machinery and equipmen and all that sort of stuff?

A. That is true. It is a relatively minor thing, and Mr. Anto nelli so treated it, because he used a labor rate to trend the whol account, and, if you are going to pick trouble with me on tha score, you would have to pick trouble with him on that score

Q. I am not trying to pick trouble with you at all, Mr. Gough I just want your statement, and I think you have made it, tha when you use man-hours expended in your exhibit that that i not actual man-hours-expended, but a computed figure.

A. That is correct.

Q. Now, you have made a comment, I think, in reply to Mr Springer, that what you wanted to show was not methods of trending, but that Mr. Antonelli's trends were unreasonable, is that the substance of what you stated, Mr. Gough?

A. Well, I didn't want to show that they were, but I was obliged to, when I made the study.

Q. But you yourself, you say, developed no methods of trend ing—is that your testimony?

A. No. I have no thoroughgoing method of trending 6725 there.

Q. Let me ask you, when you state, on Page 7 of your exhibit, for example, in the second paragraph, last sentence, referring to two studies for various years which you described in the first part of that paragraph, and when you go on to state, "In both studies, the ratio that the costs of earlier years bear to the costs of 1938 were developed and compared with the trend factors used in Exhibit No. 20," what do you mean that that ratio is?

A. You mean what makes them comparable with the trend factors?

Q. No. What is this thing that you developed? You say it isn't a trend factor.

A. Well, it is a ratio that the costs of earlier years bear to the cost of 1938.

Q. Well, if you wanted to take the cost of earlier years and find out how you would translate them into present prices, wouldn't you apply these ratios that you use?

A. That might be—I think it would be a fairer method than Mr. Antonelli used, by all means. The only thing, however, is

that I wouldn't want to be placed in the position of saying, if I were making a trend, that I would exactly do that, because I haven't considered the question of what the right answer of how to get a trend exactly would be, you see.

6726 Q. But aren't these ratios that you develop all through your exhibit really trend factors developed on a different basis, which you used to say well, you don't think Mr. Antonelli's trend factors reach the right result?

A. Well, they are not trend factors, because I have not used them for trending, and if I were going to develop a trend I would have to consider a number of other things. For example, I would have to consider whether I would use the prices for 1938 that Mr. Antonelli used.

Q. Well, if these ratios that you have developed aren't trend factors based on another method of approach or analysis, or giving consideration to factors other than what you think Mr. Antonelli did, how could you say that his trend factors don't reach the right results because they don't reach the result that you would use if you used these ratios?

A. Well, I think it is possible, Mr. Milde, to point out the flagrant errors or mistaken methods that one man uses, without completely developing what you would do if you were going to do the job. That is all I am trying to say.

Q. Well, you would say, Mr. Gough, wouldn't you, that these ratios or trend factors that you developed would be items that you think ought to be taken into consideration in any proper trending?

6727 Mr. REEDER. I object.

Mr. SPRINGER. I object.

Mr. REEDER. The witness testified that he hasn't developed any trend factor, and counsel is trying to put words into the record that don't belong there.

Mr. SPRINGER. This is outside the scope of Mr. Gough's examination.

He said that he took Mr. Antonelli's study and made a test of it. He starts out with an assumption, for purposes of making a test with Mr. Antonelli's figures. He doesn't know whether they are right or wrong, but all he does is follow Mr. Antonelli in his reasoning, and tests it to find that it is in error.

TRIAL EXAMINER. Objection sustained.

Mr. MILDE. Note an exception.

By Mr. MILDE:

Q. Well, Mr. Gough, these ratios that you developed were not trend factors?

* * *

6728 A. They haven't been used to develop a trended cost.

By Mr. MILDE:

Q. I understand that. You haven't applied them to the whole property. But what are they?

A. Well, they are ratios of the cost of one period to the cost of 1938, as Mr. Antonelli developed costs for 1938.

Q. And what——

A. (Interposing.) I think he might better have used them as trend factors than what he did. Whether I would have so used them is another question.

Q. Well, your criticism of this and his unreasonableness, as you expressed it to Mr. Springer, is based on the fact that his results don't coincide with the results that you get by applying these ratios, isn't that so?

A. That is correct.

Mr. SPRINGER. Read that. I didn't testify anything. Read it, please.

6729 Mr. MILDE. You are doing your best to testify.

(Whereupon the last question, as above recorded, was read by the reporter.)

Mr. MILDE. And read the answer.

(Whereupon the last answer, as above recorded, was read by the reporter.)

By Mr. MILDE:

Q. Now, tell me why, Mr. Gough, you prefer the results of the application of your ratios to Mr. Antonelli's ratios.

A. They take into account the factor of productivity.

Q. And what does that mean?

A. Well, it means that you relate to the costs of today the methods of today.

Q. Well, let me ask you this: What result do you think he should have reached?

A. Oh, well, I don't know. You are asking me to extemporize a trended result.

Q. No. I don't mean in figures. I mean in principle. What result should he have reached?

Mr. SPRINGER. I object to it.

A. I am not prepared to say what his trend should have been, Mr. Milde.

By Mr. MILDE:

Q. No, but what should he have reflected in his final figures? You say he should have reflected present productivity
6730 and present prices, is that it?

A. Well, Mr. Milde, a trend usually is conceived as a short-cut to a reproduction cost new appraisal, and ideally, I think should equal—that is to say, if the original cost is correct, and if your factor is correct, you come to the same result that you would by pricing all of the property out at its present reproduction prices, but I wouldn't want you to put me in the place of saying what answer you should get by a trending or a reproduction cost appraisal, because that hypothesis involves, frequently, a tremendous number of incongruities. For example, you have 3,300 wells; if you had to drill them in '38 I don't know whether you could get the equipment or the trained personnel to drill them. It presents you with a great many problems.

Q. Well, I was just interested, Mr. Gough, in your theory that he reached an unreasonable result, and, as I get your testimony, you think he reached an unreasonable result because he arrived at costs which were higher than reproduction cost would be.

A. Yes: I just pointed out that one unreasonableness in his result. Now, if he had eliminated that, it was a major one. There might have been others—many others.

Q. And you also think, as I understand it, that, if he had
6731 done a job just as carefully as could be done, and following all suggestions that you might give him to assist him on that, that he ought to arrive at a reproduction cost of the property?

A. Well, Mr. Rhodes stated that ideally the two should come to the same answer, if you take into account the productivity factor, but I am not an expert on reproduction cost appraisals. I have never made one and I hesitate to tell you how it should be done.

* * *

By Mr. MILDE:

Q. Of course you recognized, Mr. Gough, in your exhibit, did you not, that what Mr. Antonelli purported to do was not to arrive at present reproduction cost estimate by a trending development, but to determine what this property would have cost, as it was actually built if the prices now prevailing for labor and material had actually prevailed since the beginning?

* * *

6732 A. Yes; that is what he purported to do.

By Mr. MILDE:

Q. Now, Mr. Gough, when you state, on Page 1 of your
6733 exhibit that the purpose of your study, and examining Mr. Antonelli's trends, quoting them, was to learn exactly by what means it was effected, and to ascertain whether the results obtained were in any sense a fair value of the Company's property. What you meant there was whether or not Mr. Antonelli's results reached correctly present prices and present labor productivity, and, in short, present cost of the properties, as they would be built today?

A. Well, either that or any other—there are two major tests of fair value—that is, original cost and reproduction cost—to be considered, and whether this met one of those tests.

Q. Well, your quarrel with him was that he arrived at results that were, in effect, higher than what reproduction costs would be as of today?

Mr. SPRINGER. I object to that. Mr. Gough has said he just tested Mr. Antonelli's methods and found defects in them.

TRIAL EXAMINER. And he criticized them?

Mr. SPRINGER. Yes, but he didn't care what Mr. Antonelli's answer was. It was the method of trending that he was testing.

Mr. MILDE. You can't test a method and say it doesn't reach the right result unless you know what result should have been reached.

* * *

6734 TRIAL EXAMINER. I assume, when you say "quarrel," you mean "criticism."

Mr. MILDE. Criticism; yes.

TRIAL EXAMINER. Objection is overruled.

A. In effect, that is what he did, and I think it is the result of his methods which I think are at fault.

By Mr. MILDE:

Q. And that is why you criticized his methods?

Mr. REEDER. I object to that. The witness answered the previous question. Now counsel is trying to get him to say what reproduction cost ought to be today. He said over and over again that he isn't testifying as to that and, of course, it would be improper if he did.

TRIAL EXAMINER. Objection sustained.

Mr. MILDE. Note an exception. That is all.

Transcript Pages 362–373

Cross-examination By Mr. SPRINGER:

Q. Will you refer to page 21 of Exhibit No. 11, please? In the account Depreciation and Depletion Reserve under the year 1934, in the amount of $5,901,317.53, will you please explain the basis for that transaction?

A. In the year 1934, we adjusted our Depreciation and Depletion rates downward, and we applied that adjustment back to January 1, 1927, and we transferred from the Depreciation Reserve to Surplus this $5,901,317.53, with the approval of our West Virginia Public Service Commission.

* * *

Q. You say that you adjusted your depreciation rates downward in 1934?

A. That is right.

Q. What was the basis for that adjustment? Do you
363 have studies which reveal that you were charging too much annual depreciation expense?

A. Mr. Springer, you will notice that we have very high depreciations accrued, some $40,000,000, and we knew that that amount was greater than was needed for various provisions, and in determining this amount to adjust, our surplus was down rather low in the end of 1933, and we transferred the amount that we thought would be necessary to carry on our business in the amounts that might be needed. In adjusting those rates, we took into consideration, of course—we made a study of our retirement losses and other provisions for which depreciation might be needed.

Q. Do you have that study available?

A. We have where the adjustment was made.

Q. You spoke of a depreciation study which prompted you to change your rate of depreciation on certain property, I believe?

A. In determining these rates, we applied—at the end of 1926, we had settled our tax matters with the Income Tax Department, and the rates that they had approved for tax purposes, a number of them were used in this adjustment.

Q. Is there a study which was prepared by your staff to
364 determine the proper rates of depreciation for the various classes of property for 1934 on?

A. No detailed study; no, sir.

Q. How did you reach the conclusion without a detailed study?

A. It was more a—there was no detailed study made. It was more of a judgment figure.

Q. How do you account for depreciation?

A. I might explain briefly that over a period of years—over a 40-year period, it has been the practice of the company to set up annual amounts that would provide for retirements—the amount of money that we would need in the business to develop the property.

Q. Was that based upon age life studies?

A. No, sir.

Q. And the result of setting up that—that is a judgment figure, I assume?

A. Well, the whole plan was to keep enough money from revenues, from earnings, to develop the property with. There is a substantial amount of it that has been developed from money retained in the business from revenue.

Q. Do you have a study of the life expectancy of the various classes of property in the Hope Natural Gas Company?

A. No; we do not.

365 Q. Do you know the present age of the major classes of property in the Hope Natural Gas Company system?

A. No; we do not.

Q. On page 6 of Exhibit 11, you show that for production system property, you reduced the rate of depreciation for unoperated acreage, for instance, in 1929, from 10 percent to 8 percent in 1938. What is the explanation for that?

A. Beginning with 1923, we had set up 10 percent on unoperated acreage to make provisions for acreage cancelled and surrendered, and that rate was found to be accumulating too much in amortization, and it was reduced to 8 percent.

Q. And how did you reach the conclusion that it would accumulate too much?

A. Well, the amount accumulated over the period of time was too large in proportion to the amount of investment in that unoperated acreage.

Q. What is the explanation for reducing the rate of depreciation on general structures from 5 percent in 1929 to 3 percent in 1938?

A. These different rates on various classes of property were only used and adjustments made to determine the annual
366 amount—the adjustment in the annual amount that we wanted to reduce.

Q. You said that you do not have the information on the age or the average age of any of your classes of property?

A. We do not have it as such; no.

Q. In your annual report to the West Virginia Public Service Commission, don't you set out the pipe by size and average age?

A. I believe in making that report there is some computation put in there—some figure put in. However, it does not mean anything as to the actual age. It is an average.

Q. You file them as actual reports on the operations and information about your company?

A. The report called for it, but we did not have the information, and there is just some computation made there on an average basis. It is not exactly correct, but it is used as an average age.

Q. You say over the 10-year period mentioned in your Exhibit No. 11, page 6, there has been a decrease in the annual depreciation rate. You say that there is no scientific study upon which you base that decrease?

A. No; there is not.

367 Q. Well, I cannot understand how you can guess at what is a proper annual rate of depreciation without mortality data or age-life information of your property. How did you do it?

A. The plan that we followed, as I explained to you, Mr. Springer is—we take into consideration the annual amount of money that we might need. We know what our retirement losses have been over the past few years, and we know what our losses to capital account has been, and we take all of those different factors into consideration, and we aim to keep in our business a certain amount of money needed to provide for those things rather than to do new financing.

Q. What will you do under the prescription of the new Uniform System of Accounts prescribed by the Federal Power Commission effective January 1, 1940, which prescribes for the annual accruing for depreciation accounting on other than the retirement account basis that you speak of?

A. We are now installing that system and we are having our engineers and so on make a study of these depreciation matters, and we will endeavor to put that into effect.

* * *

369 A. It has no connection with these statements here, Mr. Springer. It is a separate matter. I have been trying to tell you what we have done. You will notice that we have got $10,000,000 here in these depreciation reserves. The company is 40 years old, and there has been no scientific study made of this depreciation and so on in the plant, in fact we did not operate that way, and as I have endeavored to explain to you before, it has been the company's plan and procedures and working all down through—of course, 40 years is a long time—but they have used this depreciation here just as I see it in keeping in the business and retaining from revenues and, so on the money to finance themselves and to develop their property. A substantial amount of their property has been developed through this medium rather than to—in fact, you could have—if you had had the actual accrued depreciation in the plant, you could have set up a smaller amount, and if you had followed the same procedure you would have had a very large surplus, so that in the $40,000,000, quite a bit of that is excess surplus. On the other hand, with going along on that basis, if they had paid out—if they should have paid it out in dividends and then extended their plant and additions, we would have had to put
370 out new financing to do it, but they elected to go this route.

Q. You have never practiced depreciation on what is known as a straight line basis?

A. Well, we have applied different rates to various classes of properties. Those are kept more as working sheets or data like that in order to accumulate—in order to determine the annual amount, whether you wanted 1½ million dollars, whether you wanted 2 million dollars. However, the amount that is accumulated on the various features of investment in the depreciation

account really does not mean anything as to the actual depreciation of the plant.

Q. Those working papers you spoke of were the basis of your conclusions? Could those be furnished to Mr. Lyon tomorrow?

A. You have reference to this adjustment that was made in 1934?

Q. Yes; I would like to see the studies that were made. You spoke of negotiations with the Bureau of Internal Revenue. You apparently had studies to back your claim up, and if you would give Mr. Lyon access to those tomorrow, I would appreciate it.

371 A. I think we furnished to your staff the rates that the Bureau of Internal Revenue had fixed for the various classes of property on a straight line basis.

Q. The working papers behind those are available, aren't they?

A. We had no working papers.

Q. How did you substantiate you claim for certain depreciation rates at that time?

A. With the Bureau?

Q. Yes.

A. They fixed the rates.

Q. Do you have the basis of their computations?

A. No; that was done—at the time these rates were agreed upon, and so on, was just by discussion and talking the matter over and a certain rate was on transmission, and as I recall it was 3½ percent—transmission investment. A certain rate on this class of property or that class of property and certain allowance was made.

Q. Didn't you disagree with them on any of the rates of depreciation that they selected?

A. Yes; we may have argued with them on some of them.

* * * * *

373 Q. Mr. Chisler, will you refer to page 21 of Exhibit 11 again, the item of Depreciation and Depletion Reserve in the amount of $5,901,000. Is not that adjustment of those reserves properly an adjustment of operating earnings shown on page 20 of this exhibit?

A. I would say not. We had closed our books for these various years, and after this 1934—this adjustment was made direct from the depreciation reserve to surplus. Page 20 shows just exactly what we did on our books.

Q. But the origin of the approximately $6,000,000 is operating income, isn't it?

A. Well, of course, on your depreciation expense along there—if you would change that depreciation expense it would show a different result in the net income.

Q. That is what you are doing in effect, is it not?

A. Well, you make adjustments from time to time for prior years, dividends, and so forth. You may adjust your surplus account, but your surplus adjustments will be taken ito consideration on any study that you want to make of the year's business. We have done this just as it is reported on our books.

* * *

Cross-examination by Mr. SPRINGER:

Q. Mr. Rhodes, in Exhibit 21, reproduction cost new less depreciation of company properties as of December 31, 1938, will you define depreciation as you have used it in your exhibit?

A. In brief, it is the extent to which probably has been consumed or otherwise used up in the operation of the company.

Q. Is that loss in service value or physical deteriora-
881 tion?

A. It is all the depreciation which exists, in fact, in the property.

Q. Could you list the elements that cause depreciation?

A. Corrosion, wear and tear, deterioration from the elements, exhaustion of gas wells, and to a minor extent, the obsolescence of certain parts or types of equipment in the property which are leading to retirement.

Q. Did you also consider inadequacy of equipment?

A. To the extent that it has any application; yes.

Q. You have probably described changes in the art as obsolescence; is that so?

A. Yes; changes in the art may be a cause of obsolescence.

Q. Have you considered the requirements of the public authorities?

A. To the extent that they are applicable.

Q. And the changes in demand upon the Hope Company?

A. To the extent that it is applicable.

Q. Will you define what you term as condition percent in your exhibit?

A. It is the percentage amount—it is 100 percent, less the amount of depreciation as I have defined already
882 expressed as a percentage.

Q. Would this be in essence your test, the percent which the condition of the unit of property in question as it existed when examined, bears to that of a like unit of property of the same size, kind and description, similarly situated, but new, and new is 100 percent?

* * *

The WITNESS. That would substantially be my test. The question in my mind is as to the meaning of "like." If by "like" you mean identical, that is so.

By Mr. SPRINGER:

Q. You have used the words "percent of depreciation accumulated" in your exhibit.

A. That is right.

Q. Is that the complement of condition percent?

A. That is the difference between 100 percent and the percent condition of the property.

Q. If you added percent of depreciation accumulated and percent condition, you would get 100 percent?

A. That is correct.

Q. How can you arrive at such a thing as a percent of a condition in which property is found?

A. By taking into consideration the factors which
883 cause the property to be used up and consumed in the operations of the company.

Q. What instruction did you give the men who inspected the Hope Natural Gas Company's properties?

A. The instructions that were given to the men who inspected pipe lines were to inspect two contiguous 18 inch sections of pipe in test holes that were prepared in advance, measuring and recording in each section the twenty or thirty deepest pits that they could find in each of those sections as to depth, taking special care to clean out the rust and scale that might have accumulated when the pipe was in the ground, and to record other conditions as to surface drainage, ditch drainage, character of soil and other factors that have an effect upon the deterioration of the pipe.

The men inspecting machinery were instructed to determine the extent to which that machinery, the wearable parts of that machinery, had worn out in service. The men inspecting buildings were instructed to record the extent to which the building in its various parts had rotted or deteriorated or otherwise worn out.

As to buildings and equipment, they were also instructed to report any special conditions that to them seemed to require consideration. They were all sent in the field to ascertain
884 facts, which facts were brought into the office, correlated and made available for my consideration.

Q. Can two men look at the same piece of property and reach the same conclusion on the condition percent?

A. Substantially so. I have had tests made at various times in that direction and obtained results that were substantially identical.

Q. Did you give your inspectors a form sheet to fill out for the condition in which they found the property? Did you have a base assumed below which percent condition could not go?

A. No. They were asked to record the deterioration in machinery, for instance, those things which wear out in service, all of the things, and when worn out, they were done. The same thing was true of buildings, and it is well illustrated by the fact that reports came back on some buildings, with nothing but scrap value. There was no bottom.

Q. Didn't you have any classification of good condition, very good, or fair condition?

A. Yes. There were definitions under which they worked. They were asked to record as being in excellent condition, for instance, anything which they inspected which, so far as they could see, had not deteriorated at all. Another
885 common condition, they were asked to put in bad condition anything which they saw which was seriously deteriorated and in imminent need of heavy repairs.

There were intermediate conditions between those two, such as good, fair, and poor; in other words, it started out excellent, good, fair, poor, and bad.

When they found conditions that were worse than seriously deteriorated and in need of imminent repair, they reported the thing specially as worse than bad, and in connection with buildings, I noted from viewing the individual inspection sheets, that there were several degrees of badness, worse than the bad.

Q. Do I get the impression then that your men's judgment of condition percent is an estimate of deferred maintenance in the property?

A. No. Deferred maintenance is neglect. Property deteriorates and begins to decay or begins to wear out almost from the beginning, and it is not deferred maintenance until the owner

has failed to correct that depreciation when he should. They have determined the extent to which it had accumulated.

Q. Is it possible to distinguish between what you call deferred maintenance and condition percent?

A. Yes. As I have explained before, deferred maintenance is not deferred maintenance until the property should be repaired.

886

Q. But your men have classified property as badly in need of repair?

A. No. I said badly deteriorated and in imminent need of heavy repair. If a building, for instance, were neglected after that, so that it began to fall into ruin, that would be a result of deferred maintenance, but nevertheless, when the building was ruined, would be completely depreciated.

Q How did these inspectors translate their estimate of condition percent from their minds to your mind, for the preparation of this exhibit?

* * *

Q. Will you explain now the different methods used in determining the condition percent of the major classes of property so that we can start on a common base.

887

A. Well, take compressor engines, for instance. Those engines are inspected by a man who has been living with compressor stations and their construction and rehabilitation for a number of years.

He has erected and dismantled and repaired engines of the kinds that represent the greater part of the cost of the engines in this property. He knows just what parts of these engines do wear out and which do not wear out, and we ascertained from the manufacturers the extent to which those various parts contribute to the cost.

Now, for instance, the main frame of an engine never wears out and it is never replaced, except as the result of an accident, and it does not depreciate.

The shaft of an engine rarely if ever is replaced because it wears out, and certainly the fly-wheels do not wear out. There are certain parts such as separators between cylinders in which the crosshead runs, and very little of that ever wears out. The pistons, piston rods, parts of the cylinders, parts of the cylinder heads and valves all wear out.

Now, in an engine, roughly speaking, the parts that wear out cost 30 percent of the whole cost of the engine, and the

888 parts that are never replaced except as the result of an accident, and never retired, except as the result of an accident, cost about 70 percent. Those are in round figures.

In conditioning engines, I found that this inspector had carried out his instructions, but that his recording as bad was only for those parts of the engine which were ready to be replaced in toto, so that those parts which were called bad were rated as not quite but almost gone. The parts rated as excellent were rated not at 100 percent, but partly worn; with the overall result that on this property as a whole he found that these parts that wear out in service were not quite half worn out; in other words, the depreciation, the wear and tear in the engines, was something less than fifteen percent of the total cost of the engines.

He determined the wear and tear on the engines as a matter of fact, based on his knowledge of the parts. He took into account the condition of the engines as indicated by the service records, he consulted the chief engineer in the station as to major replacements in expensive parts in recent years. His figures finally conveyed to me the extent to which those parts that wear out had worn out, and that was the starting point with respect to compressor station equipment when I started.

889. I made an addition to the depreciation which he found, the wear and tear, to reflect reasonably the cost of dismantling those parts when they had worn out. Furthermore, I found, I think it was two engines of a type that the Company has been retiring rather than moving to new locations, over the years, which engines I marked down to I believe the figure was 50 percent. The engines are perfectly useful in their present locations, but based on the Company's practice in the past, I concluded that they probably would not be moved to a new location when the other equipment in the station was moved.

I also found that there were certain details in the auxiliary plants; for instance, rather complex methods of driving the pumps and compressors, and electric generators, and so forth, which the Company was gradually displacing with the simpler and more economical drives.

That equipment was heavily marked down to reflect the practice of the Company in the retirement of that property. I also found that there were some engines of another type that this company and its sister companies are modernizing through the retirement of some parts of the engines and the fuel supply piping to these engines, and are gradually replacing with the new

and more modern parts, and the necessary change in the
890 piping to accommodate those engines, and all of such engines were marked down to reflect very heavily the probability that these parts of the engines would be replaced fairly completely in this property, as they have been in some of the other properties.

Q. How much of the property that you have described could be seen?

A. The parts that are retired and replaced can be seen to the extent of probably 90 per cent. Of course, the actual wear, the things that wear out, are concealed, but the things that cause the replacement, for instance, of gas engine cylinders, in the long run, is the accumulation of too many body cracks in the cylinders. These engines gradually crack in service from changes of temperature, and sooner or later the parts of the cylinders are replaced. The practice of the Company in this respect was taken into consideration by this inspector in arriving at the condition.

* * *

891 With respect to the extent to which the property would be seen, I have very definitely in mind in reaching my final conclusions as to the total depreciation accumulated, in the compressor station equipment, that there are sources of depreciation other than those which can be seen, and having that in mind, I increased the depreciation which could be seen from 17 per cent by an additional two per cent which I believe adequately reflects all of the other causes of depreciation in compressor station equipment.

By Mr. SPRINGER:

Q. All causes other than wear and tear, you have given——

A. (Interrupting.) No; wear and tear and those that can be seen. You can see, for instance, that these two engines that I mentioned, that I marked down because the Company had been replacing them, you can see in your inspection of the property that they are becoming obsolescent; you can see from an inspection of the property that this complicated method of driving auxiliaries was being gradually retired and replaced with a simpler one. That is, change in the art or obsolescence.

892 We could also see, and which I failed to mention before, that there is certain compressor equipment in one station, in fact, that is not being used, and that equipment was reduced down to the warehouse value of the equipment, as though it were

carried in the warehouse stock instead of the compressor station operating equipment. All of the cost of the installation has been eliminated, and all of the parts that could not be salvaged were eliminated. Those are things which can be seen by an observation of the property.

The additional 2 per cent was to cover those things which are likely or have been causing retirement of the company's compressor stations in the past—an allowance for a continuation of that in the future, having in mind that there is a very high salvage on this type of equipment, most of which is moved bodily to a new location.

For instance, at the present time a station is being built down at Hunt, from equipment, practically all of which is taken from other stations in the company or its affiliate,—the Reserve Company, which has now been absorbed.

Q. Would you describe in a little more detail the inspection method used to determine the condition percent in compressor station equipment?

A. Each piece of equipment was examined thoroughly
893 and carefully to the extent that it can be examined without dismantling, by a man that is thoroughly familiar with the details of the construction and operating troubles of that equipment.

Q. And you said that thirty per cent of it was wearing parts and seventy percent nonwearing parts?

A. That is right.

Q. Then does it follow that a compressor engine does not depreciate below 70 percent?

A. I have depreciated two of them down to 50 percent, but in general that is so. An engine could have all of its wearing parts completely worn out, in fact moved to a new location, it may be the case, with the wearing parts all replaced, and that engine would be absolutely as good as a new engine, and it would last indefinitely, because the nonwearing parts are not replaced as a result of wear and tear. Nothing but an accident or an explosion or a fire.

The TRIAL EXAMINER. That is without consideration of obsolescence, is it not? You do not mean that that engine would be as efficient as the new engine or modern engines?

The WITNESS. It would be just as efficient as it ever was or as a modern engine of the same type would be. The greater part of

894 this company's engines are National Transit four-cycle engines or Worthington four-cycles, or Westinghouse. Those engines are very much, in fact almost identical with the engines that are built today, and when thoroughly overhauled, as they are when sent to a new location, will operate with substantially the same efficiency as an engine bought today.

Of course, the two-cycle engine, when overhauled, operates just as efficiently as the simple two-cycle engine when bought today. It can be by the replacement of certain parts, improved in efficiency considerably, and it was for that reason that I made provision for the retirement of those parts which had to be replaced in that improvement.

Now, there are other types of four-cycle engines, for instance, the old Snow engines, that they do not make any more, but those engines are just as efficient after a complete overhauling as they were when they were first built. They will never be retired because they are not quite so efficient as the type of four-cycle gas engine which is more common in the company's property. They move it to new locations as circumstances indicate.

By Mr. SPRINGER:

Q. Mr. Rhodes, in what percent condition would a compressor engine be before retirement?

A. You mean before the engine itself is junked?

895 Q. Isn't there a point where maintenance is so great and depreciation is so advanced that it is uneconomical to run an engine or compressor?

A. No; that is not so. Compressor engines never get in that condition unless they are grossly neglected by the operators. You can take an engine that has been grossly neglected by the operator and you can replace the wearing parts and tune it up and it will run just as efficiently as it ever did. The cycle of replacement of these parts that wear out is fairly short in the case of some things. There may be some things, every two or three years, like valves, in certain locations, and maybe cylinders will last twenty or thirty years on the average, but sometimes they last only a few years, but the engines, if properly maintained, do not become increasingly expensive to maintain, as a general thing.

Q. Did you determine the age of every unit of property?

A. No; I was concerned only with its physical condition, because irrespective of its age, it can be restored to perfect condition for a relatively nominal cost. Age has nothing to do with the retirement of gas engines. In the Company's experience here,

the only cause of engines that have ever been retired, as
896 nearly as I can find out, has been either as a result of an accident or of this one type of engine which would be classed as a freak type which has never proved satisfactory in operation, and they are retired only when the question of movement to some other location is involved, and it is decided that it is not worth while to do that. Those are the only engines retired, as far as I have been able to find out, and they represent possibly 1,000 horsepower out of 90,000 odd which the company owns.

Q. When you speak of freak equipment, do you refer to the $30,000 worth of equipment at the Davis station which was reconditioned and then sold for junk?

A. Those engines at the Davis station were of that type; yes. They were very expensive to repair, and very troublesome to repair when they got into trouble.

Q. Will you describe other methods of inspection to determine the condition per cent of compressor station equipment?

A. That covers compressor station equipment in general. Of course, buried pipe lines, for instance, in compressor station yards, are taken to be in substantially the same physical condition as the other pipe lines. The buried pipes, valves and fittings that connect the yard lines to the engines, were placed in
897 the same condition as the engines. They consist of parts that do not wear out, in fact, the only parts that do wear out are the rings and the packings in the valves, but they were placed in the same condition as the engines, and so was the other property which was buried, in connection with the engines, such as the foundations.

Q. Will you please turn to page 19 and 20 of Exhibit 21 and describe the methods of inspection you used in determining the percent condition by the accounts as they are described there, and if you do not have a separate method of inspection, then please describe the ones you did employ.

* * *

The WITNESS. There were only three basic methods of inspection. All equipment, whether it be engines, compressor cylinders, valves, fittings, regulators, meters, drilling and cleaning equipment or whatnot, all of that type of equipment was inspected by the use of the principles that I have just outlined. The differences between them are really minor differences in that a more thorough inspection would be given of an expensive piece
898 of machinery than of a cheaper piece of machinery.

The second method of inspection relates to structures, and a third method of inspection relates to underground pipe lines.

The gas wells were depleted not by inspection but in proportion to the reduction in useful working pressure.

As to buildings, and buildings at compressor stations, they were inspected at the same time the equipment was inspected, by a man who was a building designer and constructor and who was living with the design and construction and repair of structures for a great many years. He has built structures for me and he has designed structures for me, and he has torn down structures for me. His instructions were, as I have already stated, to record excellent, good, fair, poor and bad, and he reported 45 degrees worse than bad.

I found myself in discussion with him of what his intent was, and again we found that an excellent part of a structure—and he inspected the structures in their various parts—not just looking at a structure, but he inspected the foundations and the framework and the walls and the roof and the floors of the structures—I found that these parts that he had rated as excellent had deteriorated on the average not over 5 percent, and the worst degree of bad was down to junk, so we weighted it—he had about ten degrees of condition—and we weighted those conditions of the various parts of the buildings, or rather, he did, in the proportion as they contributed to the cost of the building, and got a rating for the building.

The building might have had a rating of poor or fair that he arrived at by that method. Then he put together in a similar manner the ratings of all of the buildings in a group, like at a compressor station, and gave me that rating which he translated into a percent deterioration, in other words, it was his opinion as a result of that calculation, that the buildings in that group had deteriorated so many per cent.

Q. Could you tell me the inspection method employed to determine the percent condition of the drilling and cleaning equipment?

Mr. MILDE. Are you through with your explanation of the buildings?

The WITNESS. No; I am not.

The TRIAL EXAMINER. Before you go any further, I would like to ask one question. How did he average the grades of his good, bad, and so forth, in order to arrive at a classification of the whole building?

The WITNESS. In buildings, for the purpose of weighting, he just used consecutive numbers. That is all that is necessary, but the effect of it was to rate as excellent, five per cent depreciation, and each one of his successively poorer conditions was ten per cent worse.

The TRIAL EXAMINER. He inspected the foundations, for instance, and he rated that, we will say, as excellent?

The WITNESS. Yes.

The TRIAL EXAMINER. Then he rated the walls, we will say, and he rated them good.

The WITNESS. Yes.

The TRIAL EXAMINER. And the roof he rated fair, or something like that?

The WITNESS. Yes.

The TRIAL EXAMINER. Then how did he get the average for the whole building? Did he reduce it to percentages?

The WITNESS. He did not do that, although he could have done that and he would have had the same answer. If he had carried out his weightings, for instance, by calling the excellent foundation 95 per cent, the good frame 85 percent, and say the fair roof 75 percent, and so forth, he would weight those percentages in proportion as these various parts contributed to the cost,
901 and he would end up then with a weighted average percent.

It is easier to work with index numbers, which will give you the exact result—exactly the same result, but in effect that is what was done.

When this man's work was finished, and he had assistants with one or two other men, I spot checked their inspections, and without know what their figures were, or their results were, and those checks came, as I say, substantially to the same answer.

These figures were totaled for all of the buildings in an account, and I was given a statement as to the percent of deterioration he had found in that account. I adjusted that to fairly reflect the cost of abandoning that building or tearing it down or tearing down parts. I adjusted that to reflect buildings, the usefulness of which had ceased.

For instance, in that Davis station that was just mentioned were five engines that had been junked, and I reduced that portion of the building which was of no use, to the scrap that could be obtained from tearing it down.

Incidently, that building will later be used, or soon will be used, for auxiliary equipment to release a present auxiliary building for storage purposes. But there are other buildings, like the Lemley station, for instance. That station is a
902 station in which the equipment had been reduced to its warehouse value. That building has no use except to shelter that equipment which is remaining there pending its need in some other location. That building was reduced to salvage value.

In other cases, wherever we found that there were buildings that we had the reproduction cost new, we reduced those buildings down to salvage value.

In the case of some types of buildings, like small buildings, housing field meters and those buildings can be picked up bodily and moved to a new location when they cease to be used for that particular location—the same is true of meter boxes, but when you are dealing with large buildings of the type most commonly used by the Company, they are torn down, various parts of them are salvaged, and used over again for other structures, in various accounts.

Having thus determined all of the depreciation which could be seen, namely the deterioration of the buildings and the fact that they were not used, I then, realizing that there was depreciation from other causes, more or less intangibly, which could not be seen, I increased the depreciation.

For instance, the gas well structures, the observed depreciation was 40 percent when I corrected it, but I added 4 percent
903 more, and generally throughout these structures, I have decreased the depreciation observed by, in round numbers, one-tenth, to reflect that depreciation which cannot be seen but which is leading and has led in the past to the retirement of the structure from service. That method was applied to all of the structural accounts.

Gas well structures, field measuring and regulating station structures, other production system structures, compressing station structures, transmission system measuring and regulating structures, and other transmission structures and general structures. In every case it started with observation of deterioration on the part of a man skilled in the art of designing, constructing, and taking care of buildings.

Q. Is it fair to state then that in every case where condition percent of units of property was estimated, that the physical deterioration was the major factor?

A. That is correct.

Q. Will you please describe the method of inspecting drilling and cleaning equipment?

A. The drilling and cleaning equipment was inspected by the men who are using that equipment and not by our men. I rated the equipment at its usefulness to them and then
904 later, after consultation with me rated it down to the extent that it had worn out, reflecting what they had been able to get on the average as salvage. Equipment for which there was no use was reduced to what they were currently obtaining and selling such equipment in salvage value, for partly worn out equipment.

I took that into consideration by some calculations made from a portion of the equipment, for instance, such as bits for drilling. Those bits are six feet long when they are bought, and there is about three feet to wear, or thereabouts, and we had the measurements of a great many of the bits, and I found out what proportion of the useful wearing portion of the bits had been consumed and used that as the test of the reasonableness of the company's inspection of the equipment which they were using.

In the matter of cordage, for instance, like cables, which wear out fairly rapidly, I saw to it that the condition of those things was marked down substantially to half way between new and junk value, because they exist in all conditions, from new cables that have never been used, to cables which will never be used again after they come off the present job. But, as related to the equipment, its wear and tear of the equipment that is being and can be used, and the salvage value of that material which
905 they can and are disposing of as fast as it can be absorbed.

Q. Is there any difference in durability or efficiency of drilling and cleaning equipment? Have there been any advances in the art of manufacturing drilling and cleaning equipment?

A. Yes; but the equipment which the Company now has that might be in that class is practically all of the new type. The particular advances in the drilling and cleaning equipment have been in the use of portable outfits, which the company has thirty or forty of—I forget the exact number—which make it unnecessary to move in and erect a derrick and set up the house for the engine and the belt house, etc. That is required with the old

type of drilling and cleaning equipment, but with the new type, they move a portable outfit up there, and it is in, everything is there that is required to do the job. There have been no particular improvements other than that, and for the purpose of repairs and deepening of wells, which is the company's use for it, the bits that they have are just as effective as though they were made of the more modern steels, which perhaps would be more desirable, if the company itself were going into a heavy drilling program, but for the purposes of repairs, there is nothing better than that which the company now owns.

906 Q. Does the company drill its own wells?

A. Not now. It deepens wells at times, after they have been cleaned out.

Q. Does it have use for what you estimate to be more than a million dollars worth of drilling and cleaning equipment?

A. Well, I examined the principal operations carried on by the company for the past fifteen or twenty years that required the use of drilling and cleaning equipment, and found out the maximum needed at any one time that was likely to be needed, and the company could not get along with less than sixty of such outfits, and probably should have seventy or eighty of such outfits.

Well now, the outfit required to clean a well costs just about the same amount as the outfit required to drill a well—somewhere between $12,000 and $15,000, depending upon its type. Eighty of such outfits would cost approximately $1,200,000 and sixty almost $1,000,000. That relates only to those things which they use immediately in cleaning the wells. The company, in addition to that which is actually being used, has different stocks of spare parts and spare material, special tools, and so forth, so I reached the conclusion by that independent study, that the total amount of drilling and cleaning equipment of

907 $1,000,0000 was by no means excessive, and its depreciation to $751,000 fairly represents the extent to which that has worn out, and the extent to which salvage can be had of the equipment that they cease to use.

Q. Did you take into consideration in your condition percent estimate for drilling equipment, the proportion of the cost of such property which has already been charged to the drilling of the wells?

A. I considered only the equipment as it exists, and what it would cost to replace that equipment.

Q. Will you please describe the method of inspection used to determine the condition percent of transportation equipment?

A. We studied the record of automobiles for the last ten or fifteen years, that were retired, to find out when they were bought, when they were retired, how much was paid for them, how much was received for them, how many miles they had traveled before they were finally turned in. We studied the record and found that the company was getting an increasing mileage of its automobiles and trucks before they were turned in, in fact there was a considerable increase, particularly in trucks.

We found out from that trend in increasing mileage, what the mileage fairly was as of December 31, 1938, and
908 the passenger automobiles, for instance—we depreciated them, rather, in the proportion of the mileage that they had had run on the average, at December 31, 1938, which that bore to the total mileage to be expected from the automobiles as of that date, reflecting of course as a minimum the average turn-in-value of the cars.

Q. Didn't you consider the year on the Blue Book rating?

A. We gave no consideration to that. It was based wholly on the company's experience in the retirement of cars and the increase in mileage that they had been getting from cars and trucks, and the actual mileage of the cars and trucks, as of the date taken. In other words, they were depreciated in the proportion as they had used up their mileage possibilities.

Q. Then you did not inspect them in the manner in which you inspected the compressor station equipment?

A. No; they were not inspected. It is a relatively unimportant account. This method of arriving at the depreciation we considered to be a complete determination.

Q. Will you please describe the method of inspection for determining the condition percent of office furniture and equipment?

909 A. That is another minor account. That equipment was all inspected. Each piece of equipment was inspected and rated from the standpoint of physical deterioration. That which was left up in Pittsburgh was conditioned in the condition that the People's Company were willing to take it over, except certain portions, which were described and were considered as junk.

We found that that equipment, by that method of inspecting it, had depreciated 27 percent, which I increased to 30 percent.

to make sure that the amount was adequate to cover all of the depreciation which existed in that furniture. That is a $200,000 account.

Q. Can you tell the percent condition of a table by looking at it?

A. One can estimate the extent to which it has deteriorated; yes. As related to any individual piece of furniture, the estimate is rather rough, but as related to hundreds of pieces of furniture, these roughnesses iron themselves out, so that the over-all figure is reasonably accurate.

Q. You did not determine the age of any of them?

A. It makes no difference, because some of the oldest furniture in the world is the most expensive. Age has
910 nothing to do with it.

Q. Didn't you consider performance ability?

A. Performance has nothing to do with a desk which is physically perfect.

Q. You mean that you would put your feet on an antique desk?

A. No. There are no antique desks in this property.

Q. You just stated that sometimes it increases in value with age, but for utility purposes, useful purposes, that is not so, is it?

A. For useful purposes, a desk is just as useful fifty years old as when it is new, if it has been kept in repair and all of the parts are there, all of the drawers will operate satisfactorily, and it can be kept in that condition, and an inspector can tell from the appearances of furniture and an examination of it, how much of it has depreciated for practical purposes.

Q. Will you please describe the method of inspection to determine the condition percent of the tools and working equipment?

A. Frankly, we did not spend a lot of time on the depreciation of $5,000 worth of tools and work equipment. Some of that is equipment in the nature of special instruments, that are
911 useful for an indefinite length of time, in fact, if they deteriorate much they cannot be used. That $5,000 account, I have depreciated 15 percent.

Q. Will you please describe your method of inspection for determining the condition percent of the communication equipment?

A. The condition percent of the communication equipment was determined from an inspection of about five percent of all of the poles by a telephone man. The condition rating of the

poles, as excellent, good and bad, was rated down to a bad pole being ready for replacement and almost completely depreciated. The wire rated as bad was conditioned as to its approximate salvage value as copper, which is about 40 percent. The fixtures were rated the same as the poles, down to practically zero. The central station equipment, which does not represent a very large proportion, was rated by inspection, having in mind that in non-commercial service, telephone equipment has a long life.

I found, as a result of analyzing those conditions, that physically it was 27 percent depreciated. Realizing that there are some other causes of depreciation than the pure physical, it was increased by me to 32 percent. Following the determina-
912 tion of that depreciation of the equipment, I consulted with engineers of the West Virginia & Potomac Telephone Company, who agreed with me that it was a very reasonable amount of depreciation to find in a property such as would be owned and operated by a natural gas company, where style and commercial sales consideration do not enter into it. It is purely a service equipment.

Q. Did you employ the same man to determine the percent condition of communication equipment as you retained to inventory that equipment?

A. No; it was another man.

Q. Was there an inspection of rights of way?

A. We walked hundreds of miles of right-of-way in determining construction conditions and saw something over 2,000 miles of rights-of-way. The right-of-way itself does not depreciate.

Q. And that is true of natural gas producing lands?

A. In general; yes.

Q. In determining condition percent, did you instruct your men to consider the size of the unit of property?

A. There was no occasion to consider the size of the unit of property.

Q. Did you instruct them to consider strength of the unit of property?

A. Strength of a property does not deteriorate. The
913 strength of a pole at the butt is the dominant feature as to whether or not it is worn out or decayed to the point of almost complete depreciation, but the strength of a pipe does not deteriorate. The strength of a gas engine does not deteriorate. Strength does not enter into it except as it weakens the

thing through deterioration, which is reflected automatically in the physical figures which were brought in to me by the inspectors.

Q. Does the strength of a boiler make any difference in its condition per cent?

A. The strength of a boiler that has been for years passed by the insurance inspector as in perfect condition is not changed. That boiler has not depreciated from deterioration.

Q. Do you know what the average life of a boiler is?

A. The average life of a boiler might be from five years to a hundred years, depending entirely on how it is taken care of. I know that in the common run of boilers, that the insurance companies think of thirty years, but they will insure a boiler forty years old and take the full responsibility for all damage that can occur due to the failure of that boiler, if the boiler is kept up to their requirements on inspection.

Q. Did your inspection of boilers embrace a hydraulic
914 test?

A. No.

Q. Did you consider the elements of the dollars required to restore the item to condition as new?

A. No.

Q. Did you consider its age?

A. In connection with boilers, we did take into account the age of the boilers, in this way—I found that these boilers had various ages, up to fifteen years or so, and which comprised most of them, and that they had been running for years without any evidence of deterioration, as indicated by the reports of the Hartford Boiler Insurance Company inspectors, which is the company which insures those boilers. The inspector for the insurance company makes whatever inspections are necessary to protect his company. He reports defects, and there were no defects reported, and so I reached the conclusion that those boilers had, in spite of their age, only lived half the life, or rather, had only depreciated to half the extent that boilers do on the average, and so I took the figure as used by the insurance company of thirty years, and depreciated that one half to fifteen years.

Q. Did you consider the element of age in determining the condition per cent of the pipe lines?

915 A. Not directly.

Q. Did you consider the element of age in determining the condition percent of the compressor station equipment other than boilers?

A. I did not.

Q. Did you consider the element of age in determining the condition per cent of buildings and structures?

A. No, I considered only the defects of age.

Q. Did you determine the life expectancy of the units of property which you inspected?

A. No; we determined, however, the average extent to which the life expectancy of various retirement units and replaceable parts had been exhausted.

Q. How did you determine that?

A. The same way that you tell whether half of the gasoline in your automobile tank is gone or not. You know whether it is half gone or not without knowing how much the tank holds. I did it in just the same way.

Q. Could you illustrate that with a structure?

A. You cannot illustrate it perfectly. I explained that this inspector of structures rated the parts all the way from substantially perfect to ready to junk, and it was necessary to depend upon his judgment and skill as an expert on buildings,
916 which was done. You cannot measure it as related to a building.

Q. And you could not relate it to a gas engine either, could you?

A. Not readily.

Q. That would be true of all of the property, wouldn't it?

A. No.

Q. What are the exceptions?

A. You can measure it directly as related to pipe lines.

Q. Their life expectancy?

A. No; the ratio to which the various parts of that pipe line have lived their life expectancy without going through the age or the life expectancy, and you can determine the ratio.

Q. I shall read the definition from page 5 of Exhibit 13, which is the Uniform System of Accounts for Gas Utilities prescribed by the Public Service Commission of West Virginia in 1939: "Service value means the difference between the original cost and the net salvage value of the utility plant." Did you give that any consideration in determining the condition per cent of the units of the property?

A. Only to the extent of substituting reproduction cost for
o r i g i n a l cost, and substituting for the words "net
917 salvage value" the words "net salvage recoverable."

Q. Did you consider the capacity to do the work assigned to the unit, either as compared to a new unit of like type or a new unit of some better type?

A. The capacity of these units to do the work assigned to them has remained unimpaired.

Q. Do you mean that the art of manufacturing natural gas property is stagnant, with no improvements?

A. The improvements in the art of natural gas properties, which have led to these long distance transmission lines, mean nothing as related to a property such as Hope, with its thousands of points of receiving gas, its fifty-odd compressor stations, scattered all over the system, and its 4,000 separate pipe lines. The improvements in the art mean nothing there and will not lead to the retirement of any of the parts of the Hope's property.

Q. The new pipe lines being installed in the United States are so-called high pressure transmission pipe lines, aren't they?

A. Yes.

Q. And Hope's transmission lines from Cornwell station to Hastings, which is 92 miles of 12-inch pipe, capable of operating at a pressure of 1,200 pounds, is a high-pressure line?

918 A. That is right.

Q. Do you believe that the trend in natural gas transmission is to high-pressure lines?

A. Where the gas is to be transported in large volumes for long distances, yes; but it has not and will not lead to the retirement of any of the Hope's property.

Q. Did you consider the element of safety in determining the condition per cent of property?

A. Safety does not enter into it except in boilers, and the boiler inspector of the insurance company will cease to insure the boiler when it is no longer safe, but the boiler is perfectly safe as long as he will insure it. A gas engine thirty years old is just as safe as a gas engine bought yesterday, in fact I am not so sure that it is not safer for a year or two of operation. The pipe lines of this company are just as safe today as they were when they were built. The corrosion of pipe lines does not weaken them.

Q. Do they ever have joint trouble?

A. Surely; joints leak from time to time, and the leaks are fixed and they do not leak any more.

Q. There have never been any fires or explosions due to leakage?

A. Most inconsequential.

919 Q. Then really, your condition percent was based upon observed physical deterioration in the Hope properties, was it?

A. We started with observed physical deterioration. There was added to that all of the effects of obsolescence and things of similar nature which have been and are leading to the retirement of Hope's property, and on top of all of that, there was added an allowance which I deemed sufficient to cover all depreciation of all other kinds, existing in the property. Wells, of course you understand, we are treating purely on the pressure decline basis, to a net salvage value of equipment.

Q. Is your condition percent theory one which finds the Hope Natural Gas Company property, that is, the compressor station equipment, to be in 81 per cent condition on a depreciated reproduction cost of 19 percent throughout the life of that plant, and then indulges in an hypothesis of suffering a final loss to zero during the last stages of service, possibly within a year?

* * *

920 The WITNESS. No.

By Mr. SPRINGER:

Q. Exactly what happens when, as of December 31, 1938, you find compressor station equipment in 81 percent condition and next year the unit of that property is retired. Does it fall from 81 percent to zero within that period?

A. I know of no unit that is likely to be retired next year or for some years to come.

Q. If it comes within two years, does the condition percent go from 81 percent to zero within two years?

A. No. I said merely that the depreciation existing in the property as a whole is 19 percent—not that the condition of any one piece of property is any percent, but the property as a whole has deteriorated 19 percent from all costs. I do not attempt and it is fruitless to attempt to arrive at an exact condition of depreciation from all causes on any one piece of equipment. It can be applicable to a group of equipment, but not to one piece of it.

Q. You see, Mr. Rhodes, what I cannot see is how you find a piece of property at 81 percent condition this year, and within two or three years it might be replaced, and in that short period of time it goes from 81 percent condition to zero.

921 A. I have not found a piece of property is in 81 percent condition. I found $10,000,000. worth of property, con-

sisting of hundreds and hundreds of items that in the aggregate were in 81 percent condition. That $10,000,000 worth of property is not going to get down to zero percent condition tomorrow or the next day or deteriorate very rapidly at any time.

The TRIAL EXAMINER. That is the average condition?

The WITNESS. That is the average. Some of the compressor stations there, I have made adjustments that would reflect some of them as merely warehouse value of the equipment that is in those stations. Other engines, as I told you, I have marked down to fifty percent, because I thought that they would be retired before they were really worn out.

I made an inclusion in my depreciation to reflect that fact, but I have not set a percent condition, and am not setting a percent condition on anything other than the entire compressor station equipment account.

Q. Pardon me. Didn't you say that you found some property which you considered to be in fifty percent condition?

A. I said I included in my depreciation an amount which was fifty percent of the cost of reproducing that property for the purpose of making the depreciation, which I found sufficiently large to include all of the depreciation from all causes.

Q. Under your theory, the condition percent of the Hope Natural Gas system cannot vary throughout its lifetime from say an average per cent condition of 50 and above, is that so?

A. Oh, probably it will never get as low as 70.

Q. And yet, when one of those units of property which make up the composition of the system is retired, that must be in zero condition?

A. No. It will be retired from one location and installed in another location, and that is what has happened to this equipment in these stations that were no longer useful in the present location.

Q. But if it wears out?

A. But they do not wear out. There are a few units, which I explained, have been junked, because they were of a type which has proved to be an unsatisfactory type, and I marked those down, although they will continue to be used in their present location, for years to come, they are standby or spare equipment that are used under the conditions of extreme peak loads.

This company has not retired compressor station equipment except of the parts that cannot be salvaged when they

923 move the equipment in one station to another location.

Some of the underground pipe and some of the small valves and fittings, the foundations, and things of that nature.

Q. Mr. Rhodes, isn't there some unit of property in the Hope system that wears out after it has been used for a period of time and has to be replaced? Which is junked? Doesn't that happen in a natural gas system?

A. The cylinders of the gas engines; yes.

Q. Now, that gas engine you appraise today as being say 50 per cent condition——

A. All right.

The TRIAL EXAMINER. Did he not say it could not depreciate below 70?

The WITNESS. I have stated that I allowed in my total depreciation, 50 percent of the cost of reproducing. I think it was two engines, which were of a type which have not proved satisfactory. I think that is what he is referring to.

The TRIAL EXAMINER. There you are taking into consideration, perhaps, the retirement policy of the company, in addition to the condition of the equipment, are you not?

The WITNESS. That is right, and I also took that into ac-
924 count in conditioning this complicated drive of the compressor station auxilliaries, which I mentioned in conditioning or making allowance in the conditions of the two-cycle gas engines, which the affiliated companies, at least, are modernizing. I am taking into account all of these things which are determinable, and then making an additional allowance to cover the more or less indeterminate things, that cannot be measured or visualized.

Mr. MILDE. I think, Mr. Rhodes, you did say, in connection with some engines, that there were wearable parts involving thirty per cent on them to depreciate?

The WITNESS. Oh, yes. But, on the other hand, an engine of an unsatisfactory type, which would soon be junked, that 70 percent disappears, and that is a move in the direction that I think Mr. Springer is trying to bring out.

Those are the only cases that I found in the whole property where serious consideration needs to be given to the fact that the equipment is likely to actually be retired in part. The equipment is not retired when it is moved from one station to another.

By Mr. SPRINGER:

Q. I am still disturbed about the theory that finds property in a certain per cent condition today, and maybe in two years a unit of that property will be replaced and you drop from a high
925 percentage today to zero in a short period of time.

A. You could scrap any unit of property of this company, and eliminate it from the whole depreciated reproduction cost, and it would not have any material effect on the answer.

Q. Do bed plates for engines depreciate?

A. No; bedplates for engines are never replaced because they are worn out. Occasionally, they may be in an accident, or like a fire—having the same effect as a fire. Things do not depreciate because they may burn up sometime, and for the same reason bed plates do not wear out because sometime you have an accident and have to replace them. As a matter of fact, I do not think the company has ever replaced an engine bed plate in all of its history.

Q. Do you know whether or not it has replaced three engine bed plates at Cox's mill?

A. No; I do not know.

The TRIAL EXAMINER. Your theory of depreciation does not make any allowance for such contingencies as that, does it?

The WITNESS. Except as I am increasing the amount which I concede to cover depreciation from hidden causes. There may be flaws develop in the bed plate of an engine, there may
926 be flaws in fly wheels—fly wheels burst once in a while, but it is just a snare and a delusion to try to place any depreciation on a fly wheel because sometimes fly wheels burst, and bedplates and main shafts are in the same category.

By Mr. SPRINGER:

Q. Will you please turn to page 2 of Exhibit 21. You state that depreciation accumulated in the gas wells was determined from the proportionate decline of the useful rock pressure from the time the well was drilled, to a lower pressure, at which the well may be considered to be exhausted. By what conception of depreciation have you determined that the decline in pressure in a gas well is a measure of accumulated depreciation?

A. That is the exhaustion of the gas well in the operation of the Company, and it is measured proportionately by the decline in rock pressure from the initial pressure to the abandonment pressure.

Q. Why is a decline in the rock pressure the measure of accumulated depreciation in a gas well?

A. Because it is the measure of the extent to which the gas well has been exhausted in service.

Q. Did you consider the amount of gas exhausted or the reduction in the pressure?

A. The two are approximately synonymous, and it is a method of depreciating gas wells which has come into
927 common use and is accepted by the courts as well as by the operators, in the case of many companies.

Q. Do you say that pressure and volume are synonymous?

A. No.

Q. You used decline in rock pressure for your basis here.

A. That is right.

And decline in rock pressure is practically synonymous with the decline in the recoverable quantity of gas in the well.

* * *

928 By Mr. SPRINGER:

Q. Have you adjusted the rock pressure figures based upon the pressure gauges taken in the Fall of 1938 to the date of December 1, 1938, of your exhibit?

A. I conditioned the well to the rock pressure gauges
929 taken in the Fall of 1938, as being fairly reflective of the condition of the wells on December 31, 1938. Any further reduction is not measurable.

Q. There was no appreciable decline in rock pressure between your study date and the date of your exhibit?

A. There is no way to measure it.

* * *

Q. Do you know whether there was withdrawal of gas during those periods?

A. Certainly there was withdrawal of gas.

Q. Then there was a decrease in the gas supply?

A. Yes; if you want to split hairs, there was a decrease in the pressure at the end of December, December 31, 1938, as compared with September.

Q. Your study would not be perfectly accurate for today, would it?

930 A. Well, quite a bit of time had elapsed to today. If I wanted the condition today, I would take the latest rock pressure readings that were available, and determine it on the basis of those readings.

Q. Do you make a distinction between rock pressure decline and decrease of volume of gas supply?

A. They are practically synonymous.

Q. Where a natural gas property is retired, due to the exhaustion of the supply of gas, is the principal cause of the retirement the exhaustion of the pressure of the gas supply or the exhaustion of the volume of the gas supply?

A. The cause of the retirement of a gas well is generally the result of an accident. Gas wells as they approach the average abandonment pressure may have a cave-in or some other accident of that kind, and at the first opportunity a drilling and cleaning outfit goes out to the well and cleans the well out and tests the well. If, after they have cleaned out the well, that well has a satisfactory volume of production, it is restored to service, whether the pressure is above or below the average abandonment pressure. The actual abandonment is determined by whether or not the well can be restored to a useful well. If the well cannot be restored to a useful well by repair, the well is plugged up
931 and abandoned, whether the rock pressure be higher or lower than the abandonment pressure.

This matter of abandonment pressure is an average, and individual wells are not properly conditioned by the decline from their initial rock pressure to an average abandonment pressure, but the condition of a group of wells is properly determined by depreciating them from their initial pressure to their average abandonment pressure.

* * *

934 By Mr. SPRINGER:

Q. Mr. Rhodes, did you secure the initial rock pressures and abandonment pressures and the 1938 rock pressure from the Hope Company's geologists for use in your exhibit?

A. That is correct.

Q. If there are any errors in those pressures furnished to you, those would be perpetuated in your exhibit, would they not?

A. They would be reflected in the exhibit; yes.

Q. Will you please refer to your working papers and read into the record your determination of the percent condition of a gas well producing gas from one horizon?

A. It is explained in the text rather completely. We do not specifically determine a percent which I consider to be the percent condition of any one well. We determined percentages that when added together and averaged fairly reflect the percent con-

935 dition of the groups of wells.

Q. Mr. Rhodes, would you please in your example name the well and the sand and the date of drilling and the rock pressure?

A. I will take, for example, well No. 1270, which was drilled in 1909 into the 30-foot sand. The well had an original rock pressure of 860 pounds. The abandoning pressure for that 30 foot sand is 30 pounds, leaving 830 pounds as the useful or workable pressure in the well.

The annual tests of the well made in the Fall of 1938 where the well had been closed in long enough to develop the rock pressure showed that the rock pressure at that date was 230 pounds.

Subtracting 30 pounds abandoning pressure leaves 200 pounds as the remaining workable pressure. The ratio of those 200 pounds remaining workable pressure to the 830 pounds initial or original workable pressure gives 24.10 percent as the percentage condition of that well, or the percentage decline of that well down to the abandonment pressure. If the well happened to be abandoned at the abandoning pressure, then it would represent the exact condition of that well.

Q. Now, will you please give us an example of how you
936 determined the percent condition of a gas well producing gas from two horizons?

A. Well No. 1380 was drilled in 1910 into the fifth sand—please strike that; that is not a good example.

Well No. 2263 was drilled into the Indian sand and into the fifth and Bayard, which are produced as one sand in that well.

The abandoning pressure of both of those sands is 30 pounds per square inch. The initial rock pressure in the Indian sand was 350 pounds, leaving a workable pressure of 320 pounds. The initial pressure of the fifth and Bayard sands was 815 pounds, leaving a workable rock pressure of 785 pounds. In the annual tests in 1938, the Indian sand showed a work pressure of 97 pounds, leaving a remaining workable pressure of 67 pounds.

The fifth and Bayard sands were at 95 pounds pressure, leaving a 65 pound abandonment pressure. The percent decline in workable rock pressure in the Indian sand was the ratio of the 67 pounds to the 320 pounds, namely, 20.94 percent. The ratio of the 65 pounds remaining workable pressure to the 785 pounds original workable pressure of the fifth and Bayard sands
937 shows a decline to 8.28 percent of the workable pressure. The average of these two percentages is 14.61 percent.

which we have taken as the remaining percent of the workable pressure in the well.

Q. Will you please give an example of how you determined the condition percent of a gas well producing from three separate horizons?

A. Well No. 3570 was drilled in 1914. It passed through a number of sands, but these sands were grouped and have been produced as three horizons. The higher group comprised the Indian, the Gantz and the 50-foot sands. The middle horizon comprised the Gordon and the fifth sands. The lowest horizon was the Speechley sand.

The upper horizon, producing from sands with a 30-pound abandonment pressure had a 205 pounds original pressure, a 175-pound workable pressure, a 48-pound 1938 annual test, with an 18-pound workable pressure still to go. There was 10.28 percent of the original workable pressure remaining in that particular group of sands.

Similarly, the middle horizon has 30 pounds abandonment pressure, it had 530 pounds original rock pressure, with a 500-pound workable pressure, and it had an 86-pound 1938 test pressure, with a 56-pound remaining workable pressure. There was 11.20 percent of the original workable pressure still remaining.

938 The lowest horizon, the Speechley sand, has a 100-pound abandonment pressure. The initial pressure was 1,090 pounds, leaving 990 pounds as the original workable pressure.

The rock pressure in the 1938 annual test was 161 pounds, leaving a 61-pound remaining workable pressure. This gave 6.16 percent as the remaining portion of the original workable pressure. The average of these three percentages was 9.22 percent, which is the average of the remaining workable pressures in that well.

Q. Now, will you please read into the record an example of how you determined the condition percent of a gas well presently producing from one horizon, but which has in the past produced from another additional horizon, which has been depleted.

A. Well No. 1425 was drilled in 1909. It produced from two horizons, the upper horizon being the Indian and 30-foot sands, which have been exhausted and are taken in 1938 as being in zero condition, there being no more working pressure.

The fifth sand, which is the lower horizon, with a 30-pound abandonment pressure showed an original rock pressure of 855 pounds, with a workable pressure of 825 pounds.

939 The 1938 test showed 300 pounds of work pressure, with a remaining workable pressure of 270 pounds. This remaining workable pressure was 32.73 percent of the original workable pressure. The average of the zero and the 32.73 percent, namely 16.37 percent was taken as the percentage of the remaining workable work pressure in that well.

Q. Mr. Rhodes, are the pressures to which you have referred gauge pressures above atmospheric or absolute pressure?

A. They are gauge pressures above atmospheric measured by the ordinary pressure gauge.

Q. Now, if you will please turn to page 3 of your Exhibit 21, you state that the percent condition of each well was determined as the numerical average of the percent conditions of the sands in that well. Does such a measure give any consideration to the proportionate amounts of gas in the various producing sands?

A. It gives no consideration, but it is practically an impossibility to determine how much gas was actually contained in any of the sands that feed in the well. We found in some instances that wells with many sands, that a sand came in as a producing sand, but blew out very quickly, that sand being one of
940–941 little or no gas in it. That was ignored in the computation, so to that extent we took no account of sands which had so little gas behind them that they blew out quickly.

Q. Let us assume that a gas well has 80 per cent of its gas in one producing sand, and 20 per cent of its gas in another producing sand. If all of the gas containing the 20 per cent has been exhausted, the condition of the well under your method would be in 50 per cent condition, isn't that correct?

* * *

The WITNESS. The premises are not sufficiently complete to enable me to answer it. How much gas is in the sand that contained the 80 per cent of the gas?

Mr. SPRINGER. I think that is in the question.

By Mr. SPRINGER:

Q. All of the gas is in the 80 per cent producing sand.

A. Under those circumstances, which are impossible to exist in practice except in a well which has been exhausted in one sand and then drilled deeper to another sand, our figures would show fifty per cent for that well, and that is one of the reasons why I say that these per cent conditions which we referred
942 to as individual well per cent conditions, are really not that, but that when you take an average of a lot of wells,

3,300 wells, you will find just as many wells running one way as the other, some with the big sand fairly well exhausted and the small sand with the high pressure, and vice versa, so that, as related to the wells of the whole, this ratio of the rock pressure gives an accurate and the best available information as to the condition of the Company's wells.

Q. If we assume the reverse to be true, and the sand containing the 80 per cent of the gas has been exhausted and 20 per cent still remains in the other sand, then again, under your numerical method, you would find that well in 50 per cent condition?

A. That is right. There would be as many of the one kind of wells as of the other kind.

Q. Now, will you please turn to page 4 of your exhibit. You indicate that you studied 512 wells retired during a ten-year period. What check did you make to determine typical wells and geographical areas of existing wells?

A. I merely took all of the wells that the Company had retired in a ten-year period, and based my figures wholly on the records contained in the Company's books as to the salvage from those wells.

943 Q. But did you relate them to see whether they were typical to existing wells?

A. That is practically an impossibility. 500 wells represents about 200 miles of casing and tubing, and I think that 500 being about one-sixth or thereabouts of the total wells, may reasonably be considered as typical of the present wells. If I had gone back more years than ten years and added more wells than 500, I would have had a larger salvage value.

Q. Did you make that study?

A. Yes.

Q. Why didn't you use it in this exhibit?

A. Because I wanted to use a salvage value which was typical of the most recent of the wells abandoned.

Q. Do you know whether or not the abandoned wells were in one area of the Hope system?

A. I did not check specifically where they were. I know that abandonments currently are taking place pretty much all over the system.

Q. You state that during a ten-year period ending 1938, the Hope Company retired the 512 wells and recoveries amounted to 61.6 per cent of the total book cost. Do you know what the average age of those 512 wells was that they retired?

A. No.

944 Q. Do you know what the physical condition was of the casing and tubing in those wells?

A. No; only some of them. We know the physical condition of most of the seventy wells that were retired—that seventy wells of which we know the physical condition were retired in 1939. I do not know the physical condition of the casings retired from the 512 wells. I considered the condition of the casing retired from the 1939 wells as typical of those of the 500.

Q. Did you determine the physical condition of the tubing and casing that was originally installed in those 500 wells, to ascertain whether it was new or used?

A. There is no way of ascertaining that in practice.

Q. You mean the Company does not know whether it installs new tubing and casing or uses used tubing and casing?

A. Yes; the Company knows at the time, but records are not kept whereby it could conveniently be determined, and as I saw it, it had no part in the picture whatsoever.

Q. You do not know the relationship between the amount of new tubing and casing and used tubing and casing that went into the 512 wells originally?

A. No; except that the company's casing and tubing which it puts into the wells, in most cases, was originally purchased
945 by it as new tubing and casing. It might have been in another well before it went into this well, the exception being where the wells themselves have been purchased from some other company.

Q. Do you know the average age of the Company's casing and tubing in the Company's existing wells?

A. I do not.

Q. Do you know that the Company's wells in the aggregate have an average age of about 25 years?

A. I think that is approximately correct.

Q. Have you made a study of the Company's records with regard to the average price per ton that they have received for well equipment sold as junk or otherwise?

A. No. I was concerned with their records merely with the amount of money that they received from the sale of all materials that they recovered from wells, that they did not think was suitable to use again.

Q. Do you know that at the time that a well is abandoned by the Hope Company, that the casing and tubing that is recovered

for sale as junk has a price placed on it of one half a cent per pound or $10.00 a ton, pending the sale of that pipe?

A. I do not recall how they do it. I merely know that the records show year by year that they received from salvaged material, junked, a certain amount of money. Corrections
946 are made from time to time for any discrepancies as between what might have been accrued and what might have been received, so that over a period of years, any over or under accruals as to the price on junk is entirely wiped out for all practical purposes.

Q. Do you know what price per ton the Company received for casing and tubing sold as junk?

A. No.

Q. Do you know what became of the equipment that you described as being sold otherwise, on page 4?

A. No.

Q. On page 4 you state that 38.4 per cent of the original cost of well equipment was either left in the wells or sold for junk. Can you state the percent of original cost that was abandoned or left in the well?

A. I don't know it.

Q. You don't know whether it was 5 per cent or 10 per cent?

A. I do not.

Q. What per cent of the total book cost of the casing and tubing recovered was sold as junk?

A. I don't know.

Q. Could you give us the book cost per ton for the casing and tubing when it was installed in those 512 wells
947 that you analyzed?

A. I don't know it now. The books will doubtless disclose it.

Q. Is it about $70.00 a ton?

A. I don't know. I have given no thought to it.

Q. In connection with your study of the salvaging of these 512 wells, did you determine whether the book cost for casing and tubing equipment approximated the original cost for new materials, or whether they represented a depreciated cost when used materials were installed in the wells?

A. I made no investigation. I concerned myself merely with the company's records as related to the 512 wells most recently abandoned.

Q. You further state on page 4 that the Company was able to recoup 11 percent of the total book cost of all of the equipment by selling tubing and casing as junk, isn't that so?

A. No; I say "or otherwise," In some cases, tubing and casing is sold that other people use rather than sold as junk.

Q. On page 4, you state that 38.4 percent of well equipment was either abandoned in wells or sold as junk?

A. No; I say "or otherwise."

Q. And from that 38.4 percent, your study indicated
948 that 11 percent of the total book cost of all equipment originally in the well was recovered?

A. Of that part; yes.

Q. If no casing and tubing were left in the hole, but it was all recovered and sold, what is the indicated percent of gross salvage value for this material, according to your figures?

A. About 25 percent.

Q. Do you know how much per ton?

A. No.

Q. Then you said, following your method of determining salvage value of casing and tubing, if only 11 percent of the well equipment out of the 38.4 percent was recovered for sale as junk, the effect would be realizing 100 percent of the book cost on property sold as junk?

A. That is mere arithmetic and apparently correct.

Q. Well, errors are not made in arithmetic?

A. No; but some of the equipment recovered from the wells is sold for purposes other than junk.

Q. Do you know how much, and for what purpose?

A. No; I have no records in detail.

Q. Mr. Rhodes, will you please assume that 38.4 percent of the equipment was recovered and sold for junk or other-
949 wise, and assume that you would receive 11 percent of the book value for this junk, how much would this be per ton?

* * *

The WITNESS. Nobody can answer that question.

By Mr. SPRINGER:

Q. If we change the last word "junk" to "material" it is possible to determine that, is it not?

A. No.

Q. Would it not be possible to determine the price per ton received for the material sold?

A. If you knew the book cost, but I do not know the book cost.

Q. I gave you the book cost at $70.00 a ton.

A. I don't know whether that is right or not, because this junk, so-called, that you assume to be junk, which is not junk,
950 includes valves and fittings, which cost very much more per ton than casing and tubing.

Q. Are valves and fittings a large portion of the total of material?

A. Not a very large portion, but nevertheless they enter into the question, and when those things are sold they can be sold at a higher price per ton than junk casing and tubing.

Q. Is it customary to throw that, the valves and fittings in the same pile with casing and tubing when sold as junk?

A. Sometimes. I say the sales are made otherwise than for junk.

Q. Is it not true, Mr. Rhodes, that your junk credit here to well equipment, if excessive, would be in effect placing this property in an artifically higher percent condition?

A. That is purely an assumption. I think if the Company's records of the most recent 500 wells abandoned is the best evidence in the world of the salvage to be taken. I might have gone back and taken 1,500 wells which might be considered as better evidence, and then I would have had a higher salvage value, but it still would be a correct record of the 1,500 wells. I tried to show and to use the lowest salvage value justified by the Company's records, without attempting to theorize as
951 to about how much this junk might weigh and what it might be, but I don't know what it might be and how much I might get for it.

I am basing this absolutely on the records of the Company for the period which gives the lowest salvage value, and then I inspected the material recovered to find out whether or not the material went into the warehouse at a value equal to its book cost or some other value.

Q. Do you mean to give the impression that in future the salvage value of abandoned wells will be less?

A. I think it might reasonably be expected to continue at the level of the most recent period.

Q. On page 4, you state that you inspected equipment recovered from 70 wells abandoned during 1939, to determine the condition of the casing and tubing at retirement. What percentage of book cost was recovered from these wells?

A. I did not investigate.

Q. Do you know how much was junked?

A. No; I was concerned only with that material that went back to the warehouse as useful material.

Q. And you do not know the average age of the casing and tubing of those 70 wells either?

A. No; it could not be determined.

Q. It could not be determined?

952 A. No; because the Company uses its casing and tubing over and over again. Sometimes in the cleaning out of a well the casing and tubing is removed, and parts of it are put in new, parts of it may be put in with used casing and tubing, and there are any number of conditions that exist so that it is practically an impossibility to determine the actual age of the material removed from any well.

Q. Is that because of the lack of records?

A. Presumably so; yes; but the Company is not concerned with matters of that kind in its operations. It does not need to know, and there may be records existing, but I rather doubt it.

The TRIAL EXAMINER. Why would they put in new casing or tubing in a case like that?

The WITNESS. I don't know that they do, but they might, under certain circumstances. If they had a well which they pulled, in which most of the casing and tubing is in very excellent condition, and some parts of it are badly corroded out, they might well feel that in those locations where corrosion is very severe, they might want to put in a new casing and tubing when they put in the new equipment in the well.

The TRIAL EXAMINER. They would not save that, then, and and put it in somewhere else? The casing and tubing 953 that they had taken out?

The WITNESS. In general, they put back the casing and tubing that they take out of a well, but parts of it they do not put back because it is corroded or otherwise damaged in getting it out of the well. I merely pointed out in reply to your question that they might put in new material in places where the corrosion was very bad and in other cases it would be perfectly satisfactory to replace the damaged casing with casing out of the used casing stock.

By Mr. SPRINGER:

Q. Would the age of the casing and tubing have a direct bearing on the amount of the depreciation?

A. A rather indirect bearing as related to the casing and tubing restored to the warehouse.

Q. I mean, in the determination of the condition percent of the casing and tubing in existing wells, does the age of that bearing on the amount of the depreciation?

A. I would not say that it had, but there would be no way of finding out what the condition of the casing and tubing is in any well without pulling it out at a cost of $1,000 or so. It is a thing that cannot be determined; therefore, as I say, it is hypothetical.

954 Q. That you would say that physical deterioration which is visible from the casing or tubing that has been removed from the wells is your test of condition percent, regardless of the age of that casing or tubing or casing and tubing in existing wells?

A. It is my determination that the percent condition of that part of the casing and tubing removed which they put back into the warehouse.

Q. You do not give any consideration as to age?

A. It does not enter into the problem at all. A piece of casing that is practically as good as new, it does not make any difference whether it is two years old or forty years old. It is a perfectly good piece of casing or tubing. Age does not make any difference.

Q. You have taken the condition obtaining from an inspection of the equipment taken from 70 wells, and have extended this to 3,300 wells now owned by the Company, is that correct?

A. That is correct.

Q. Have you prepared an estimate of how old these 3,300 wells will be when they are abandoned?

A. No; I have made no attempt to do that.

Q. On page 4 you state that the recovered casing and tubing from 70 wells was depreciated by corrosion not more than

955 ten percent, and that an additional 2 percent of depreciation covers the loss through damage to threads, and so forth. Is that a determination of 88 percent condition for well equipment?

A. No.

Q. How do you reconcile those figures?

A. That is the determination of an 88 percent condition for that part of the well equipment which went back into the warehouse for re-use by the Company.

Q. Have you used that 88 percent condition for recovered well equipment throughout your exhibit 21?

A. I have applied it to the 61.6 percent recovery that went to the warehouse for re-use and determined the depreciated cost of the wells on that basis.

Q. Do you say that the recoverable equipment from wells will be in 88 percent condition, regardless of age?

A. Yes.

Q. On page 4, you explain in detail your method of placing salvaged casing and tubing conditioning on this equipment of 90 percent.

A. That was determined in exactly the same way that the condition percent on the underground pipe was determined. The explanation, if it is to be made in detail, should be made for all pipe as given, and equally applicable to all pipe.

956 Q. Do you have those working papers in convenient form?

A. The working papers are here and they are not in such form as would be reasonably possible to read into the record the method of determining the percent condition.

Q. Would it be possible to have them prepared as a supplementary exhibit? They are not relatively voluminous, are they?

A. To place them into condition so that they could be understood by the layman would be a rather difficult task, because they involve the use of mathematical equations which are quite complex in determining the ratio of elapsed age to the age expectancy of that particular material. To calculate the thing practically, involves the use of logarithms and X potential equations, and I do not know how to write that so that it could be understood by the nonmathematical layman.

Q. We would like to have that put in as a supplementary exhibit, and we will work it out.

A. I don't think it can be done so that it will be at all understandable to the Commission or to anybody else.

Mr. SPRINGER. I believe that the Commission is entitled to know the computations behind the conclusions in this exhibit and

957 the supporting detail, and I am sure that the Commission has experts on its staff who can fathom the working papers, and it is vitally important that we have that information so that the statements in this exhibit will have meaning.

* * *

962 Q. Will you please state, Mr. Rhodes, whether or not your method of determining depreciation of property is by major pit depths on the outside?

A. Basically; yes.

Q. Did you consider the pitting on the interior of casing and tubing in making your estimate?

A. No. It is not an important factor in the depreciation of casing and tubing.

Q. Is there not a water condition present in casings and tubings?

A. The casing is to keep the water out. It is exposed on the outside.

Q. There is not any water that gets inside, either casing or tubing?

A. By accident; yes.

Q. Have you taken into account the probability of deeper pits occurring in a joint of pipe beyond those tabulated by your inspectors?

A. I have taken into account the probability of deeper pits in various lengths of pipe.

Q. Between the points of inspection?

A. Yes.

963 Q. How did you make that adjustment?

A. I made the adjustment by the use of a form of equation that has been promulgated by the United States Bureau of Standards.

Q. And you employed that in your working papers?

A. One form of those equations was used in this determination.

Q. Could you give us the official designation of that Bureau of Standards work?

A. It was contained in the United States Department of Commerce National Bureau of Standards Research, paper No. R. P. 1171, entitled "Engineering Significance of National Bureau of Standards Soil Corrosion Data, by Kirk H. Logan."

Q. Do you know, Mr. Rhodes, that some of the tubing and casing which you mentioned here, and which was inspected by your men at the Federal Power Commission's engineers' request, that there were holes entirely through the pipe?

A. I do not doubt it.

Q. On page 4, have you used your gross salvage figure of 65.2 per cent on all of the wells now owned by the company?

A. I have used it to the aggregate cost of all of the equipment in all of the wells in the total, not individually.

Q. Now, will you please turn to page 5 of your Exhibit.
964 You state that in arriving at the cost of abandoned wells, you have studied the cost of 286 wells. Why didn't you use the 512 wells on which you made the study of equipment recovered?

A. Because of the amount of work required to extract from the company's records, the information, and the variations in this cost from year to year is very small, and the three or four years record which we have, I deemed to be adequate as the measure of the cost of abandoning the wells.

Q. Are these 286 wells typical of the present existing wells owned by the Company?

A. I considered them so to be.

Q. What kind of check did you make to determine that?

A. The fact that the cost of abandoning wells varies very little from year to year, and the kind of well has comparatively little to do with it. The costs are largely fixed by the fact that you have to move in there. A large part of the money is spent in getting in there to do the work, and the actual work itself does not represent so much.

Q. You did not check the location and depth and characteristics of those wells?

A. No; I merely took the Company's most recent experience in the abondonment of wells.

Q. Could you state the conditions which were considered
965 as to the abandonment of wells?

A. Wells are abandoned almost entirely by following a program which I will now outline. The well, because of its operation, gets into trouble and needs repair. The need of repair may be due to caving rock or water or leak in the casing or what not, but commonly the indicated need of repair is the failure of the well to produce gas notwithstanding the fact that it has a considerable rock pressure.

When a well gets into that condition, as some two or three hundred do per year, the company moves in generally with a portable well-cleaning outfit and goes to work on the well and cleans it out.

It has to pull the casing and tubing, and it has to break up and remove all of the debris in the bottom of the well. It cleans it out.

Sometimes they even shoot with dynamite or nitroglycerin in an attempt to clean it out.

If the well is successfully cleaned out so that it will continue to produce gas in the future, the well is restored to service. If the well, after being cleaned out and repaired, is not a successful producer any more, it may be abandoned or it may be drilled deeper to a new sand, but the cause of abandonment in any case is the final determination that the well will not produce any more gas.

966 Q. Could you state the conditions which tend to increase the abandonment costs?

A. Accidents in operation are the most prolific cause of higher costs, and the fair proportion of which is represented in these two hundred and eighty-six wells.

Q. The depth of the well would contribute to the abandonment cost?

A. Comparatively little.

Q. The geographical location?

A. As it affects the difficulty in getting in, only.

Q. On page 5 you have determined that the average cost of abandonment of the 286 wells was $898. You have also stated that this amounts to 27.2 per cent of the reproduction cost new of the well equipment. Is that 27.2 per cent on a per well basis, regardless of quantity and value of the equipment in the well?

A. That 27.2 per cent is the ratio of $898 to the average reproduction cost new of the well equipment per well.

Q. This cost of abandonment is expressed as a per cent of the reproduction cost new of the well equipment?

A. That is correct.

Q. This 27.2 per cent of the reproduction cost new of well equipment is then deducted from 65.2 per cent of the
967 book cost to produce the 38 per cent which you have used as the net salvage value of well equipment?

A. No; it is not.

Q. Will you explain how you made that computation?

A. The 27.2 per cent is subtracted from 65.2 per cent to get the 38 per cent. We are talking in terms of reproduction cost, not of book cost.

Q. That is just what I said, Mr. Rhodes.

A. I thought you said book cost.

Q. You have used 27.2 per cent based on reproduction cost and 65.2 per cent of book cost?

A. The 65.2 per cent was arrived at by a study of book costs, but in determining the net salvage, I subtracted the 27.2 per cent abandonment cost in terms of reproduction cost from 65.2 per cent salvage in terms of reproduction cost.

With the percentages of book cost in the numerators and the denominator of the fraction, it wipes out.

Q. You have not used original cost percentages and original cost new percentages in this calculation?

A. The percentage of 65.2 per cent was arrived at by a study of book costs but dollars salvage was in book cost in the numerator and the dollars of book cost of all of the equipment is in the denominator, and when you divide one by the other, the
968 book costs disappear. If the dollar salvage had been expressed in reproduction cost and if the total cost had been expressed in reproduction cost, it had exactly the same salvage percentage.

Q. Will you please divide the $898 which appears on page 5 of your exhibit, into the book cost instead of the reproduction cost and give us the per cent?

A. I do not have the book cost of these wells.

Q. Do you think that the answer would be 27.2 per cent?

A. I don't know what it would be, but the $898 is the current cost of abandoning wells, and the reproduction cost new is the current cost of equipping the wells. The ratio of those two is properly made. Some other ratio may or may not be applicable.

Q. Have you been consistent in using reproduction new percentages and original cost percentages?

A. I have consistently used the percentages set forth in this exhibit in determining the condition of the wells.

Q. And if this 27.2 per cent is increased to say 40 per cent, the total depreciation would be correspondingly greater, would it not?

A. Yes; the salvage value being less, the total amount of depreciation arrived at through depletion would be greater.

Q. You state that when a well is fully depleted, the loss in equipment is only 62 per cent of the total equipment
969 cost. Is that the maximum depreciation?

A. That is the whole depreciation that takes place in the well equipment itself on the average as related to all of the Company's wells. Individual wells may have quite different ratios.

Q. Could you explain how you arrived at the 57.4 per cent condition for the gas well equipment?

A. The result is most easily and simply explained as follows:

The total depreciation in gas well construction, which is the labor of installing the equipment and drilling the well, is the depreciation down to zero—68.7 per cent.

The gas well equipment, however, only depreciates 62 per cent down to the time when it is removed, and therefore the total percentage depreciation in gas well equipment is 62 per cent of the total depreciation in gas well construction. This gives 42.6 per cent as the aggregate percentage of depreciation in the gas well equipment due to depletion. The corresponding condition is 100 per cent less this figure, or 57.4 per cent.

Q. Mr. Rhodes, you have determined the accumulated depreciation in gas well equipment as being in the same proportion and determinable upon the same basis as well construction.

970 A. It is determined on the same basis, yes; but it recognizes 38 percent net salvage as compared to the zero salvage in the determination of the drilling of the well.

Q. Does your determination of accumulation of depreciation of gas well equipment give any consideration to the age of the gas well equipment?

A. No.

Q. Mr. Rhodes, did you give any consideration to service capacity in determining the present condition of the Hope property, especially pipe lines and compressor stations?

A. What do you mean by "service capacity"? That has no real meaning to an engineer.

Q. Service capacity is defined as "the total output of the utility plant realizable during its service life; measured in uniform units of measure, either in number of years of service, number of working operations performed or other production factors, as appropriate. A unit of property may possess more than one capacity for service, and the capacities may be reflected in more than one unit measure. The evaluated composite of those abilities controlling the service life of the property then reflect its total service capacity."

You did not consider that, did you?

* * *

971 By Mr. SPRINGER:

Q. If a pipe line originally carried 15 wells and now carries 3—the same size—has it experienced any loss of service capacity?

A. No.

Q. Why?

A. Because it is still needed to carry the output of the three wells, and in the production of gas, particularly in fields where the field pressure is low, large pipes are very desirable.

Q. Did you use the group plan in computing percent conditions?

A. I computed percent condition from a practical engineering standpoint and not from the standpoint of the accountant, which is nothing more or less than amortization.

Q. I believe that you did in your study group pipe lines in your determination of condition percent?

A. Yes, I did. But the term "group plan" as used by accountants, is a plan for amortizing investments. Naturally I determined the condition of these wells as a group—not individ-
972 ually. The condition of the pipe lines as a group; the condition of the equipment as a group; and I used the group plan to that extent, but not in amortization.

Q. Mr. Rhodes, to inquire about the percent condition of certain property, will you please refer to Exhibit 16, Part C, page 9. In your inventory of tubing and casing by districts, you have listed line pipe. What is the function of the three-inch pipe which is listed as the line pipe, and can you from your working papers tell what price was applied to this particular pipe?

* * *

The WITNESS. As to the first question, I have not investigated the specific function of the large list of sizes of tubing and casing and line pipe. Out of several millions of feet of casing and tubing, there is 7,665 feet of three-inch line pipe scattered over the property. As to the pricing of it——

By Mr. SPRINGER:

Q. (Interrupting.) That is junked, isn't it, Mr. Rhodes?

A. No. It may be a drip or a separator or a drain to
973 get water away from the well, or a cistern in cases where the oil is being produced.

Q. Will you refer to the operating districts, and is it not true that thirty to fifty percent of the Hope Company's wells are cased with 6⅝th and 5 3/16th-inch casing?

A. There are so many pages of this, that I would not want to express any opinion as to what proportions are cased with one or the other, but page 9 shows the exact footage of all of the different sizes, showing that 6⅝ casing is the predominant size.

Q. Why is it necessary to have both of these casings, 6⅝ and 5 3/16 inch, in these wells?

A. In some cases, there is production between the two. In some cases the 6⅝ inch may extend down to a certain depth as necessary in drilling that well, and it had to be left there, and after drilling by there, the 5 3/16th inch would be continued to the bottom. There are so many different possible causes of there being two lines of casing in a well that it would be futile to attempt, with respect to any well, to say what it was in there for, without an investigation and consultation with the operating department.

Q. Mr. Rhodes is it practical to produce gas through the space between a 6⅝ and 5 3/16 inch casing?

974 A. It could be, but——

Q. (Interrupting.) What is the clearance?

A. It does not take much clearance to pass small amounts of gas produced by wells in this country.

Q. The clearance of about an eighth or a quarter of an inch would not be practical?

A. It could produce gas; yes. It is not a considerable area, but it is not necessarily installed for that purpose, as I explained before. Wells are drilled and cased with a large casing down to a certain stratum, and then a smaller casing continues down.

Q. Are there other reasons, such as that the 5 3/16-inch casing is sometimes used as liner pipe for the 6⅝ inch casing which has deteriorated to the extent that its usefulness as a producing string has vanished?

A. Yes. In those cases, however, we have not included the string that is useless.

Q. This dual casing arrangement occurs mostly in the older wells, does it not?

A. Yes; it is more likely to occur in the older wells.

Q. Now, Mr. Rhodes, will you please turn to page 5 of your exhibit 21 at the topic of the depreciation accumulated in pipe lines. Did you use the inspection reports on pipe corrosion

975 made for the 1931 East Ohio-Cleveland case?

A. No.

Q. You did not rely on that at all?

A. No.

Q. On page 6, is it true that the geographic spacing of points of inspection of the new pipe lines constructed since 1931 were chosen at reproduction cost new, $20,000 intervals corresponding to those used in the 1931 inspection. That is correct, is it not?

A. These intervals of a given size were the same as the intervals of cost of $20,000, in the earlier locations.

Q. Is it true that the geographic spacing of points of inspection of the old pipe lines constructed before 1931, were chosen as reproduction cost new dollar intervals corresponding to about three or four times those used in the 1931 inspections?

A. Along the long, large lines in which we were most interested, every third one of the 1931 locations was taken, so that in general they were separated at $60,000. intervals in terms of the old approximate figures.

Q. And does not your sampling method result in inspection density on the new pipe lines three to four times that of the old pipe lines?

976 A. That is correct, but in determining the overall picture of relative density of inspections, that is properly allowed for by weighting.

Q. How did you weight them?

A. We weighted them in proportion to the spacing, in other words, those inspections that represented four spaces were given a weight of four, those that represented three spaces were given a weight of three, and those that represented one space were given a weight of one.

Q. That is in your working papers also, isn't it?

A. Yes; that is the working papers.

Q. And you gave no consideration to the age of the pipe?

A. Consideration of the age of the pipe in the principal trunk lines where the age was definitely known was given in determining certain of the factors that enter into these equations which I have previously mentioned.

Q. When you summarized your calculations on pit depths in the pipe lines at the various locations, were the averages you developed for the system as a whole arithematically determined, or did you state that they were weighted?

* * *

977 The WITNESS. The averages of the pit depths were summarized by sizes of pipe first and in making that summary the relative weights of inspections as to spacing, were reflected in arriving at the average pit depths representative, let us say, of 6-inch pipe or 8-inch pipe or 10-inch pipe. Then the contribution of each of the sizes of pipe to depreciation was determined and the overall picture was determined by weighting the contributions of the different sizes of pipe proportionately to the number of inspections on that size of pipe, so the averages were determined throughout by weighting.

Q. Did you make any attempt to determine the age of the pipe which you inspected?

A. Only as previously explained.

Q. Did you make any attempt to determine whether the pipe you inspected was pipe installed originally in that line or as replacement pipe?

A. Such an investigation was made in connection with the inspections of the principal pipe lines which were used for the purposes of determining the constants or certain of the constants in the equation.

Q. Did you make any attempt to determine whether the pipe which you inspected was new pipe or whether it was used or second-hand pipe when it was installed at the location which you inspected?

978 A. Only as related to the inspection on the major lines.

Q. If you will please refer to page 7 of your Exhibit 21. Will you describe how you measured the depth of the pits in the pipe inspected?

A. The pipe that was uncovered in the inspection pits was thoroughly cleaned of all rust, scale and so forth, for a distance or length of about four feet. The two center eighteen-inch sections of this cleaned section of the pipe were separately inspected. The determination of the depths of the pits was measured by a depth guage in common use for such purpose, but before the depths were measured, special care was exercised to clean the pits out thoroughly at the bottom, thus insuring a full measurement of depths. Approximately thirty pits were measured on each eighteen inch section, which were the thirty deepest pits that could be found by the inspector.

Q. Is it true that the surface of the pipe is sometimes corroded to such an extent that the original surface has vanished?

A. Very rarely.

Q. If it did occur, how did you measure the pit depths?

A. It occurs so rarely that it needs to be given no consideration. In general, the corrosion on this pipe is the result of an action which in corroding the pits, protects from

979 corrosion the surfaces that are not determining pits, so that it would be an unusual condition where the original surface of the pipe had disappeared, particularly in a case where the corrosion was bad and the pits were deep.

Q. But in such a case, would your method of measurement indicate the depth to which corrosion has penetrated below the

adjacent corroded surface, rather than the depth of the pit below the original surface which has vanished?

A. If there were no original surfaces, the measurements had to be made from such surface as there was, but the original surface was used, wherever it could be found and which is, I say, the common experience with the inspection of corroded pipe.

Q. What study did you make of soil conditions affecting pipe line corrosion?

A. We based our facts on the corrosion itself, as the best indication of the character of the soil. We made a great many observations as to conditions which might cause corrosion, which are used merely for the purpose of determining discrepancies and things of that nature, but the pipe itself, in the condition it is, is the best indication of the character of the soil as affecting corrosion.

Q. In arriving at your conclusions, did you give effect to the previous observations in the Cleveland case?

980 A. No; I paid no attention to that.

Q. Have you made any tests showing the acidity of the soil as affecting pipe lines?

A. No.

Q. What effect have you given to annual rainfall, ground temperatures and rugged topography of West Virginia, affecting depreciation of pipe lines?

A. All of the effects they had upon the pipe.

Q. Through what?

A. Corrosion.

Q. Through visual inspection?

A. No; through an extensive sampling of the five or six hundred test holes.

Q. Within a short period of time within which your inspections were made?

A. Yes. But the corrosion we inspected was of the pipe which had been subjected to the soil conditions, the weather conditions, the temperature, rainfall, and so forth.

Q. That is, assuming that your sampling method was all right?

A. The sampling method was adequate.

Q. Is it true that the presence of ground water or soil moisture contributes much to the external corrosion of pipe lines?

981 A. That is one of the things that contributes to corrosion; yes.

Q. You did not make any study of the extent that bacteria has contributed to corrosion?

A. I made no study of bacteria.

Q. Page 8 of Exhibit 21, please. You state that the rate of corrosion has been found to fall off with age?

A. Yes; that is the universal experience in corrosion.

Q. Would you say that where corrosion is being caused by electrolysis, that it increases with age?

A. We have no electrolysis as an important factor in these lines, and I doubt if it appears at all, but as a fact that is true, because even in the cities, the electric cars which cause electrolysis, have practically disappeared, so it is also true as related to electrolysis.

Q. Have you made a study to determine whether the Hope system has been subjected to electrolysis?

A. It obviously has not been subjected to electrolysis, being pipe lines out in the country, far removed from any trolleys, with the exception of a very small portion of the lines, between here and Weston.

Q. Do high-tension transmission lines affect pipe lines?

A. Not in the least.

982 Q. Is that so?

A. That is so.

Q. But assuming that electrolysis has attacked a pipe line, is it not a constant that does decrease with time?

A. That depends upon the electrolysis, but in this Company's property, the corrosion does fall off definitely with age. The inspection of the pipe line proves it beyond a shadow of a doubt.

Q. Did you take into consideration any interior corrosion in pipe lines in your determination of their condition per cent?

A. Interior corrosion is practically non-existent in pipe lines in this territory.

Q. Does sulphur-bearing gas produce interior corrosion of pipe lines?

A. Under some conditions.

Q. Do you know that sulphur-bearing gas has been produced in West Virginia?

A. It has been produced, yes; but it does not go into this company's pipe lines.

Q. But do you know that sulphur-bearing gas was transmitted in the Hope Natural Gas Company's pipe lines before its effect was detected and eliminated by treatment?

A. Oh, for a short time, but the action of sulphur
983 requires years to create any corrosion that you could even find.

Q. On page 8, when you state that the rate of corrosion decreases with time, have you used that retarding curve in arriving at your conclusion?

A. I have.

Q. On the per cent condition of the well casing and tubing and pipe line pipe?

A. I have used the same degre of retardation, which degree, as I have used it, is a lesser retardation than is actually experienced by the company, thus producing a calculated depreciation greater than would be the result if I had used exactly the company's experience.

Q. Is the development of that in convenient form in your working papers?

A. I don't recall what form that is in in the working papers. The rate of retardation which I have used here has been used by me because it is from the standpoint of depreciation the rate of retardation giving the highest depreciation which has been found on any of the soils east of the Mississippi by the Bureau of Standards in its tests. I was greatly concerned to find out whether or not this company's pipe lines retarded in corrosion more than
that convenient rate which I have used. If it is not in
984 the working papers, the data is there from which it could be readily obtained.

Q. As an example, will you take 6⅝-inch casing having an original wall thickness of 250 mills; by inspection it was found that the average of the deepest pits were 125 mills, and the average of the ten deepest pits were 115 mills. Will you please give the per cent condition that you would place on this pipe?

A. That calculation cannot be made on the witness stand, and furthermore you have not given me all of the data that is required to make the calculation.

Q. What else would you require?

A. I am asking you. You are asking me to solve the problem.

Q. Under your theory of retarding curve, even if penetration is 50 per cent through the pipe wall, you will find a per cent condition much greater, possibly 80 per cent, wouldn't you?

* * *

The WITNESS. You are not giving me all of the infor-
985 mation that is required to make such a calculation, and even if I had made the calculation, that, by itself, would be only one of the things that I would take into account in arriving at the final figure as to depreciation.

By Mr. SPRINGER:

Q. What other conditions would you like us to assume? We will work with you and help you solve the problem.

A. This calculation—if you will give me all of the conditions of the calculation, I will be glad to have it made up, but it would take at least half an hour to make out simply the calculation and assemble the necessary data.

The TRIAL EXAMINER. What are the necessary elements of such a calculation?

The WITNESS. First of all, he must tell me in how long a section these pits are found. Is it two feet or eighteen inches or twenty feet or what?

By Mr. SPRINGER:

Q. Pit observation made in 18-inch lengths extrapolate to twenty feet.

A. I will be glad to have the calculation made if Mr. Smith is here, or I could make it myself, but this kind of a calculation involves the use of log tables and so forth, of which I have none available.

Mr. SPRINGER. We would be very pleased to have him
986 furnish it at his convenience this afternoon, Mr. Examiner.

The TRIAL EXAMINER. Have you all the information you need there now?

The WITNESS. Yes. I can now apply this data to this modification of the Bureau of Standards formula, and I will give you the result.

By Mr. SPRINGER:

Q. Now, Mr. Rhodes, for the purpose of tracing your conclusions as to the retarding effect of age on the rate of corrosion, could you read from your working papers the results showing

the period of time necessary to reach entire penetration, if pits have penetrated one-quarter of the wall thickness in fifteen years?

A. I will be glad to have that calculation made.

Q. What per cent condition would you place on a transmission pipe in the Hope system if you had used the straight-line extrapolation rather than your retarding curve method?

A. I would not have used it. I would not use the straight line at all, because it is contrary to facts, and I cannot state what condition I would have placed on the property if I had used that method erroneously.

Q. You made such a study, did you not, on casing?

A. I had a calculation made on casing, as a matter of curiosity, to find out what the figures were, but I could not
987 use those figures in depreciating anything.

Q. What percent condition did you reach on that calculation?

A. I did not reach a per cent condition on that calculation. I just reached a figure that would result on certain assumptions contrary to facts, as a matter of curiosity.

Q. Was it not lower than the per cent condition that you used in this exhibit?

A. It was not a per cent condition; it was a calculation under certain assumptions, contrary to the facts and the experience of the Company. The calculation was not used by me at all.

Q. If you had used the straight-line extrapolation method instead of your retarding curve method, would that have resulted in a decrease of about 20 per cent in the per cent condition which you have placed on transmission property?

A. I don't know. I would not use it, because it would not result in any figures that have any meaning as to depreciation.

Q. Would not a substantial amount of money be involved in transmission main pipes which you have given a per cent condition of 79 per cent to, if that were varied one way or the other two per cent?

A. The result would be two per cent one way or the
988 other.

Q. Of $16,500,000 worth of property?

A. Yes; 2 percent of that amount of property is about $300,000 worth of property.

Q. Did you study the causes of corrosion on well tubing?

A. The causes of corrosion on well tubing are largely the same as the causes of corrosion on pipe.

Q. Referring to the field line experience of the Hope Company, do you know that more than two thirds of the field lines that have been constructed by the company have been abandoned and taken up?

A. No.

Q. Approximately 12,000 field lines have been taken up over the life of the Hope Company; did you know that?

A. Taken up or moved to another location?

Q. Taken up and some disposition made of them.

A. I don't know how many have been moved.

Q. You have not given effect to this rate of abandonment and net salvage from that, have you?

A. A reasonable reflection of the fact that field lines are moved from place to place with changed sources of gas supply is reflected in my adjustment to the percent condition of field
989 lines. It is amply reflected. It takes into account that fact, and it also take into account the reverse fact that in conditioning the laying cost of field pipe as the same as the pipe itself, I have overdepreciated all of the pipe lines that have been moved to new locations.

Q. Mr. Rhodes, in depreciating field lines, what consideration have you given to the gradual exhaustion of the connected gas supply?

A. That is a wholly indeterminate effect. I have studied the condition of the company's wells for some years in the past and find that they reached a condition many years ago which on the average is about the same as the condition which they have now, namely, between 30 and 35 percent. There is no evidence that in the aggregate the Company's wells or gas field are declining. Wells go out and new wells are drilled a short distance away. Sometimes fed by the identical line which was fed by the well which was abandoned. You will find places upon the system with almost every conceivable combination of new and old and abandoned wells.

Taking up of lines with the abandonment of wells is a pretty indefinite thing. I have allowed, I consider, for that, amply, in adding to the depreciation that I found by consideration of corrosion, an additional depreciation of 3½ percent, which is approximation, one-sixth of the depreciation from cor-
999 rosion. That I consider amply reflects all of the depreciation that exists in the field lines because of the fact that

some of them are moved from this place to that place as the wells are abandoned and new ones are drilled.

Q. Will you state your condition on well construction?

A. The percent condition on well construction which was based on reduction in rock pressure is 33.1 percent.

Q. Does that have any bearing upon the determination of the depreciation of gathering lines?

A. No determinable effect.

Q. I believe you said field and gathering lines are moved to new wells frequently, and you made some allowance for that?

A. Yes. I consider that any depreciation existing in the field lines because of that fact is amply reflected in my field line condition of 67.8 percent.

Q. When field or gathering lines are moved to new wells, the original labor and construction costs are lost because there is no salvage value other than the equipment itself, as the pipe enters its second cycle, isn't that so?

A. Yes. The labor is largely lost; yes.

Q. Those non-recoverable costs are depreciable with the pipe at the original location?

A. That is right, and I have amply reflected that fact in my adjustment.

Q. And your adjustment is a judgment figure or a
991 mathematical figure?

A. It is largely judgment, in that there is no methematical way of determining just how much depreciation exists in the lines. It is absolutely impossible with respect to most of the individual lines. It can be approximated as related to the whole system.

Q. Do you know what the ratio between labor and materials are on the gathering lines that are moved to new well locations?

A. About half and half.

Q. What do you figure would be the cost to salvage pipe lines?

A. About 15 percent of their total cost in place.

Q. In the case of pipe, other than casing and tubing, where have you given any effect to salvage *in* your exhibit on accrued depreciation?

A. In reaching my conclusions as to the percent depreciation on account of corrosion, I took into account the salvage value for re-use of the pipe. This system is essentially a continuing system which will last indefinitely, and when the pipe in a system

corrodes and has to be replaced, the pipe is re-laid in the same location. The actual cost of lifting the old pope and putting it back again, aside from the cleaning, is less than the cost
992 of laying the line in the first place, so that any pipe that is picked up and cleaned and reconditioned and re-laid, the total labor cost of that operation is the same as the total cost of originally laying the pipe, or practically so.

Q. Now, we have considered the salvage value of that pipe for reconditioning, taking into account the cost of cleaning it and the cost of welding up the deep pits, which are necessary, to make it re-usable. Those things are taken into account and arriving at the final figures which were arrived at as a matter of judgment as to what was indicated by this salvage as compared with carrying the pipe down to a complete depreciation without salvage. The percent condition of the pipe lines fully reflect salvage value of the pipe in re-use. Then you consider that the pipe line system will last through its physical life?

A. It will last indefinitely. There have been no important changes other than additions during the company's whole forty years of history, in its main pipe lines. I have further more increased the pure corrosion depreciation in transmission pipe lines by a further one percent to represent any other depreciation that might exist from other causes.

Q. Do you believe that there is an indefinite supply
993 of gas in West Virginia to prolong the life of the pipe line system?

A. There is no indication that would be a guide as to any future exhaustion of the gas supplies of the company. The company's reserves have varied up and down for a period of years, and they certainly are not indicative of a company that is on the way out.

Q. Wond it be thirty years or fifty years?

A. There is no indication of any period. In fact, the indication is that the gas available to this company, from some source or other will be available for an indefinite future period.

Q. I hope so. Did you conduct a field examination of the conditions of pipe removed from Line H-5757 of the Hope system at the time the pipe was lifted?

A. Such an inspection was made, but has not been worked up and has not been used by me in reaching my conclusions.

Q. You did not use any of the information secured from that examination?

A. No. I have not even seen it.

Q. That study is available in the working papers, though?

A. No; it is not. The working papers contain the information which I used. That information, so far as I know has never been worked up.

Q. Is it customary to make individual studies that are
994 not used in valuations, and then that cost to be charged in rate case expense?

A. One never succeeds in doing only that which is necessary to arrive at the results. I had the inspections made because I thought it might be needed, and I found as I progressed in my studies and regular inspections, that they were not needed and therefore they have not been used.

Q. Were they any different?

A. I have not seen them.

Q. On page 9 of your exhibit, will you explain the derivation of the 22.5 percent depreciation costs by corrosion of production system pipe lines?

A. That 22 percent figure was arrived at by the use of the equations which I have referred to above, in which there was taken into account the fact that the retardation of corrosion in the company's lines is such that doubling the age results in less than a fifty percent increase in the depth of the pits. That is one of the factors represented by the equations to which I have referred, which sometimes is called the time rule of corrosion. These equations also take into account the fact that the longer the section of pipe which is examined or taken into consideration, the greater will be the depth of the deepest pits. We
995 applied those equations covering this—you might call the length rule of corrosion and the time rule of corrosion to the observed pit depths in the field line pipes, size by size.

The Trial Examiner. Does that length rule apply only to a length of pipe or to the distance between inspection points?

The Witness. That applies to the length of pipe. Take, for instance, roughly speaking, we having examined pipe in sections 18 inches long—if we had found the depths of the deepest pits, we will say 100 mills, had we examined the lengths of pipe three feet long, we would have found approximately 110 and had we examined twenty foot lengths in full, we would have found possibly 135 mills. Those figures are just rough figures, for illustrative purposes.

Now, what might be found in the extremes between locations, that are a mile or more apart, we do not know. We do not purport to say that these equations can be extended to any such extent. We have merely reached the conclusion, which is concurred in by all of those who have studied this method of determining the condition of pipe, that a proper number of inspections, which is 500 or more in this case, or really a thousand individual pieces of pipe, thus give a fair average result that will very closely approximate that if you had two or three
996 or four times as many inspections, or if you inspected every foot of pipe.

There are cases of pipe where there is almost no corrosion at all between these inspection points, and there are other parts of the pipe which might generally be expected to be worse than anything we have seen. We can get only a fair sample for a reasonable cost. But to go back to my explanation now, if I may.

I had the observed results applied to the equations, and I determined the percent of progress to what I called an end point.

One end point was where, in 20 feet of pipe there would be one well-defined hole, and at the point of leaking. I had other determinations made with 40 feet as the unit, and another with 50 feet as the unit. Then, by the use of these same equations in the manner that could be mathematically worked out, I determined what the condition of the pipe would be on the average when it had reached the various end points of one well-defined leak in 20 feet, 40 feet and so forth, determining how many pits would be on the joint per average, which would need welding.

There has been a great deal of experience in welding up of pipe, and in re-laying it, and it is rather commonly accepted practice that if the pipe is welded up so that all pits greater than one third of the pipe wall are filled with material,
997 the pipe can be re-laid and used over again with substantially as long a life as it had in the first place.

There is a sound technical reason for that in that the corrosion begins on the pipe in general when the metal is clean when it goes in the ground, and the rust on the surface of the metal such as is down in those pits, has a tendency to protect it, in fact it is that rust which causes the corrosion of the clean pipes.

I took into account the cost of that welding and the reuse of the pipe to the extent that it was worth while. On the small

pipe it is not worth while, and on big pipe it is a very profitable thing.

These calculations were all made, and the final results were placed before me and they clearly pointed, in my mind, to 22½ percent as the extent to which this pipe had progressed towards deterioration.

By Mr. SPRINGER:

Q. That is also contained in that volume of working papers that will be necessary to understand this exhibit?

A. Those calculations are all there.

Q. Will you please explain the derivation of the 20 percent depreciation of the transmission system pipe lines caused by corrosion?

A. The method was identical with that which I have
998 just described for field lines.

Q. Where is there a difference of 2½ percent?

A. Because the transmission lines have not progressed as far towards complete depreciation as the field lines have.

Q. And how did you determine exactly that 3½ percent should be added for depreciation on production system pipe lines and that 1 percent should be added for depreciation on transmission pipe lines?

A. That is a judgment figure arrived at by a consideration of the extent to which depreciation can exist in these lines from causes other than corrosion. In the case of the transmission lines, there is little or no depreciation from other causes. In the case of the field lines there is a certain amount of depreciation that might be considered as such, because of the fact that lines are moved from location to location. The need of that adjustment being greater in the field lines than in the transmission lines is obvious.

* * *

999 By Mr. SPRINGER:

Q. Mr. Rhodes, I believe you have some computations?

A. They have been made, but I have asked to have them checked, so that there will be no question about it. I think they are right, but they are being checked.

Q. All right.

A. I have the figures now. Shall I furnish them?

Q. Will you read them into the record, with an explanation, so that it won't be necessary for me to refer to the former question?

A. The first computation that I was asked to make was in the case of 6⅝ inch casing having a 250 mill wall thickness, in which the average depth of the deepest pits in one and a half foot sections was 125 mills, and in which the average depth of the
1000 ten deepest pits in all of the eighteen inch sections was 115 mills. It was desired to determine the extent to which corrosion on this pipe had progressed to the point where there would be one well-defined leak in 20 feet. Is that the problem?

Q. Yes.

A. This casing, corroded in the manner indicated here, is decidedly unusual. Nevertheless, applying the formulas to these conditions indicates that the corrosion on this pipe has progressed 36 percent towards the end point.

The second computation that I was asked to make was in the case of the pipe in which the corrosion had progressed to the point where it had penetrated the wall to a quarter of its thickness in fifteen years, and how long would it take this corrosion to penerate the wall of the pipe. The answer to that is 160 years, plus.

Q. That is the total time? Not additional to the 15 years?

A. That is the total time; yes.

Q. Mr. Rhodes, do you have two summary sheets in your working papers, upon which this exhibit is based, entitled "Summary by accounts of observed depreciation adjusted for net salvage, special observations and adjustments by G. I. Rhodes?"

A. That which I have was that, and it is adjustments to include all other depreciations. I adjusted it so that it would
1001 correspond with the text.

* * *

1002 Q. Referring to Exhibit 22 for identification, Mr. Rhodes, will you please classify each type of the adjustments you have made to observed physical depreciation, and indicate the total amount of that class of adjustments?

A. The observed physical depreciation amounts to $30,991,039.

Mr. COCKLEY. That is on the basis of reproduction cost new? All of those figures?

The WITNESS. That is correct.

1003 Out of that total, approximately $22,000,000 was in wells. I am bringing out this difference because we made no adjustment to the condition of the wells.

The first adjustment made was to allow for the cost of salvage. In other words, adjusting observed physical depreciation where it reflected no cost of abandonment to the physical depreciation adjusted to reflect the net salvage value rather than gross salvage. This adjustment amounted to $247,043.

The second adjustment was to reflect special observed conditions, such as nonuse and company practice in retiring certain types of equipment already described by me, the total amount of which was $141,883. The last adjustment was made to reflect all other depreciation than that which could be seen, and amounted to $1,251,624. This brings the total amount of depreciation found in the property up to $32,653,183.

By Mr. SPRINGER:

Q. Now, Mr. Rhodes, will you please refer to Exhibit 21 for just a few more questions on pipe lines? It has been computed that you inspected 903 feet of transmission system pipe lines in arriving at the condition percent of the entire transmission system pipe line, which totals more than 5,000,000 feet, is that correct?

1004 A. That is right, approximately.

Q. Did you make a survey of the leaks in the pipe line system?

A. No; but I made an investigation and was informed that there were practically none.

Q. I believe there is an exhibit here that shows leakage in the system of about 4,000,000,000 cubic feet annually?

A. Perhaps there is.

Q. And is not leakage in a pipe line one of the factors which must be considered in determining the condition percent of pipe?

A. No.

Q. Why not?

A. Because leakage of a pipe line is not one of the things that causes retirement. When leaks occur, they are repaired. The leakage that you are referring to is the combined result of many, many things, and of which physical leakage is one. The word "leakage" being used in a broad sense to reflect the difference between the input and the output from the system. Every joint in a pipe leaks, to some extent. Even gas leaks through the pores,

of the pipe. Meter readings are measured on the different pressure bases, and under different measuring conditions, so that the so-called leakage of 4 billion cubic feet is by no means all
1005 represented by actual physical movement of the gas through the pipe walls.

Q. I did not mean to infer that that was a physical loss, but you say there is some physical loss of gas?

A. Oh, yes. Unavoidable physical loss of gas. When leaks occur from corrosion, they are found by the regular inspection of the line, and every summer a special effort is made to find all that have developed, including leaks in couplings and those leaks all are repaired, so that in the normal operation there are very few leaks that are leaks as such, to the extent that they could be found and remedied.

Q. Then you made no study to correlate the leakage of pipe lines to percent condition in this case?

A. No.

Q. Are you familiar with the properties of the Eureka Oil Pipe Line Company?

A. No.

Q. Do you know that they have a system of pipe lines in the territory which is served by the Hope Natural Gas Company?

A. By hearsay only.

Q. Do you know that the Bureau of Valuation of the Interstate Commerce Commission and the Eureka Pipe Line Company have agreed on a service life of 50 years for all of the pipe
1006 in that system?

A. No.

Q. Is not the ascertainment of condition percent about 99 percent judgment?

A. No; 99 percent experience in the study of pipe lines.

Q. Are you familiar with the Columbus rate case of the Ohio Fuel Gas Company, in which a pipe line inspection was made in the customary manner, and in 1929 the company engineers testified that the distribution pipe lines were in 83 percent condition. Five years later, in another rate case, the same engineers testified that the percent condition of the same pipe lines was 91, that it had not depreciated, in fact it had appreciated when it was five years later?

A. I am not familiar with the case

* * *

1007 Q. When you determined the condition per cent of compressor station equipment by inspection, I believe you have based it upon relative conditions of excellent, good, fair, and poor, isn't that right?

A. And bad.

Q. Were those judgment standards, based upon a comparison of the conditions existing in the Hope system, or by a comparison with like equipment new?

A. They were based upon Hope's own practice with respect to the retirement of those wearing parts in service, and their replacement, a bad condition indicating that that particular wearing part was soon to be replaced. An excellent condition indicated that physically it was in the same condition or substantially the same condition that it would have been if it had just
1008 been replaced with a brand new part. The intermediate conditions or rating reflected intermediate conditions that were based on observations and on the judgment of the inspector in consultation with the operators of the equipment, and their replacement records, the length of the engine hours per year, and things of that nature.

Q. What condition per cent did you give to exposed foundations?

A. I gave all foundations the same per cent condition as the units upon which they rested.

Q. In the case of the Bee Compressor Station where there are only two units and four foundations, what treatment did you give to the two foundations that are not used?

A. The same as to the others. There was no equipment on them, and being in zero condition, so were the foundations.

Q. How do you know that the arbitrary per cent condition which you placed on the buried equipment in the compressor stations reveals the actual depreciation?

A. It fairly and reasonably reveals that depreciation, in my judgment. The cost of exposing it and making an inspection was so great as not to justify the trouble involved, it representing a small per centage of the total cost on the investment.

Q. And you did not ascertain the age of that buried
1009 equipment?

A. No.

Q. Are you familiar with the Uniform System of Accounts of the West Virginia Public Service Commission for Gas Utilities, 1939?

A. Only in a general way.

Q. Especially its provision for the treatment of maintenance and depreciation charges?

A. Only in a general way.

Q. And have you considered maintenance in determining condition per cent of compressor station equipment?

A. To that extent, that a well-maintained engine is always in better condition than a neglected engine.

Q. Do you know that the replacement of a bearing or a piston of an engine is a maintenance item?

A. It generally is.

Q. Did you depreciate those items?

A. We depreciated everything that wears on the engine, to determine the extent to which it had depreciated.

Q. And your determination of the condition per cent was influenced by the condition of the parts of an engine, the cost of replacement of which is a maintenance item?

A. Those small parts to which you refer do not contribute very much to the cost of an engine. The big parts
1010 that affect the cost, like the cylinders, and things of that nature, are of relative long life, and what the policy might be with respect to making those changes, I do not know—for replacing those parts, but we have depreciated all engines to reflect all the wear and tear that exists in those engines, and then adjusted the total depreciation, as already explained.

Q. I believe you mentioned that thirty per cent of the engines were wearing parts?

A. As a rough figure; yes.

Q. And over the system, would that amount to a substantial sum of money?

A. Thirty per cent of the whole cost.

Q. And of course the replacement of those parts are maintenance items?

A. They may not be.

The Trial Examiner. Do you mean of the entire thirty per cent?

By Mr. Springer:

Q. Do you know whether they are, Mr. Rhodes?

A. That is purely a matter of accounting policy over which I have no control. The greater part of the 30 per cent are large items, which should be handled through depreciation. They represent such large sums of money.

1011 The TRIAL EXAMINER. What parts, would you judge?

The WITNESS. As a matter of maintenance—purely of maintenance?

The TRIAL EXAMINER. The portion of it which should be handled through the reserve?

The WITNESS. I think probably four-fifths of it.

By Mr. SPRINGER:

Q. Mr. Rhodes, are you familiar with the list of retirement units in the uniform system of accounts for gas utilities of the West Virginia Public Service Commission for 1939?

A. In general.

Q. Can you find on that list of retirement units any of the items that you say are thirty per cent of the engines that are wearing parts?

A. No. This retirement list includes the whole engine itself as a unit of retirement, which considering some of the $50,000 engines which the company has, seems absurd, as compared with the 20 feet of two-inch pipe on the other hand.

Q. Or a bearing?

A. I consider as the proper retirement units the big things that enter into the construction of these large operating units.

1012 Q. Will you please turn to page 13 of Exhibit 21. How did you determine the condition percent of the meters and gauges, when the wearing parts are not visible?

A. The wearing parts, meters and gauges that have to be replaced, are of relatively short life. They represent a small portion of the total cost. Again, something in the order of thirty percent. In a system as old as this, it may reasonably expected that those wearing parts range all the way from brand new parts to parts that are just about ready to go, and I had in mind in using these figures as to physical depreciation that on the average we might expect to find those wearing parts about half gone.

Q. You did not ascertain the age of the meters and gauges?

A. It makes no difference how old they are. The wearing parts are old and replaced, and the meter is a new one, as the rest of the meter has not depreciated or worn out.

Q. Does the Hope Company have a large number of Tobey meters?

A. I don't recall the number, but a considerable number.

Q. Are such meters the most modern type of meters?

A. They are generally older than the meters—older than the other meters. They have been priced at a lower price
1013 than the meter that is now used, and they perform substantially as well as the newer types of meters.

Q. The Hope Company is not currently purchasing Tobey meters, is it?

A. No; they are not being made.

Q. Because of improvements that have been made in the manufacture of meters?

A. I don't know why they quit making them. Presumably there are better meters made which are cheaper to make. That in itself would account for the discontinuance of that type of meter.

Q. Will you please refer to page 16 of Exhibit 21. You say "It was agreed in both cases that those undistributed constriction costs to the extent of 11.51 percent depreciated with the company's property, and the Ohio Commission so found in the 1932 Akron and the 1937 East Ohio-Cleveland cases." By this, do you mean that 11.51 percent of the undistributed overheads are depreciable?

A. 11.51 percent out of the total of 17 and a fraction depreciated.

Q. How did you determine the depreciation of the depreciable portions of the overheads?

A. By applying 11.53 percent to the total depreciation of the property carried in the respective accounts.

* * *

5308 Cross-examination by Mr. SPRINGER:

Q. And your physical observation was of the poles in the communication system?

A. The physical observation was of the parts of the operating units of the property, poles and wire and everything relating to the communication system.

Q. Now, will you refer to the topic, Compressor Station Equipment, Line (g)? Do you know the company's experience with the Davis Station?

A. I don't recall specifically. Perhaps you will describe it more completely and let me know to what you are referring.

Q. Do you know that a study of the observed conditions of the Davis Station was made in the early 1930's?

A. No; at least I had nothing to do with it.

Q. It was made by your firm, but you had nothing to do with it?

A. Oh yes, the condition of the property was determined 10 years ago by my firm, but I had nothing at all to do with it.

Q. Do you know that the Davis Station was found in 75 percent condition by your firm?

A. No.

Q. Well, will you accept that and check me if I am
5309 wrong; and do you know that after that station was found in 75 percent condition, that it wasn't used, and that certain engines in that station were later abandoned, and that the salvage or junk value was $250 realized by the company, and it cost $600 to remove it?

A. I have been informed to the contrary, that the net salvage value obtained from junking those engines was about 8 percent of the original cost of them.

Q. Will you check that and bring in any proof that you can get and show the retirement work order on that?

A. I will endeavor to do so. May I explain this——

Q. (Interposing.) Well, there is no explanation necessary now.

A. Yes, there is this explanation necessary, because whatever may have been the percent condition found in the property at that time, was found in terms of depreciation as it was practiced at that time. I found it in terms of depreciation as determined and defined by the Commission at this time.

Q. It isn't strange to you that equipment in compressor stations would be found in 75 percent condition, and then within a few years go immediately to zero condition without any operation whatsoever?

A. Yes; I may be perfectly healthy today and dead tomorrow, and a station this year may be in perfect condition and as far as anybody can see will be used indefinitely, and something will happen during this coming summer which would shut that
5310 station down forever—and you can't tell that.

As related to specific pieces of property, you can't tell a thing, and you will note that I have placed a percent condition on the account, not on the individual pieces of property in the account.

Q. How do you figure a condition percent of an account?

A. In the same way that you figure any average. You take the——

Q. (Interposing.) You consider the components, of course?

A. I consider the composite result of everything in the account.

in the same way Mr. French did in determining the composite service lives.

Q. Is it your testimony that retirements of $926,000 represent property retired from gas service and junked or abandoned in connection with compressor stations?

A. No; I have merely stated that Mr. Dunn's figures show that so much property was retired and the losses were so much in the retirement of that property.

Q. Do you know that some of that was re-used?

A. Oh, yes.

Q. Then it becomes apparent that your figures aren't comparable with regard to salvage here?

Mr. COCKLEY. Comparable with what? I object to the question as not complete.

Mr. SPRINGER. Will you read my question, please?

5311 (The question was read by the reporter.)

By Mr. SPRINGER:

Q. By that I mean that you studied retirements of property which you admit had some units which were re-used, and you talked about salvage?

A. Yes.

Q. And Mr. French studied salvage only from retirements of property which was actually never used again. So your salvage figures aren't comparable with his?

A. Well, I have already explained that this surviving property involving a number of millions of dollars in my opinion will not, in the number of years Mr. French has said, go down to zero salvage. I can't conceive of the sudden drop from 45 percent in the past to zero in the future.

Q. But you can conceive of a sudden drop in condition percent from 75 percent to zero overnight?

A. As related to individual pieces of properties, yes, but not as related to a large group of properties costing many millions of dollars.

Q. Of course a group is the sum of the individual units of property?

A. Oh, yes; but the whole theory of depreciation as applied by the Commission applies to averages and ignores the individual items.

Q. Of course, that is not a very logical statement, is

5312 it?

A. Well, it is a fact.

Q. You mean that you can get a composite group rate by ignoring the individual?

A. You ignore the individual as an individual, but of course you take into account the effect of the thousands of individuals going to make up the whole population.

Q. Do you know what the percent condition was which you found for four gas engines in the Hastings compressor station?

A. I don't recall. The figure we found as related to those engines was found as a contribution to the composite over-all depreciation picture. I do remember that I took into account the use to which those engines were put, and the extremely low cost per horsepower of that station as a standby station.

Q. Will you furnish the condition percent of those four gas engines tomorrow?

A. I cannot do that because I did not find what I call the condition percent of those engines. I can find for you and produce the results of the physical examination of the men who studied the engines.

Q. We will present a photostat of your papers where you did make such a determination, to you tomorrow.

A. No; my determinations of condition percent, as I have
5313 testified more than once, were intended to apply to the account as a whole. As related to any individual part of the account, they are what you could see, and represent the extent to which that contributes, and you will also recall that after having added up and determined the composite, I made an over-all adjustment of the whole thing, not to any one particular station, and accordingly the figures as they relate to one station are not final figures, they are just a step to the final answer.

Q. Do you remember that your condition percent of the four gas engines was about 88 percent in your working papers?

A. No; I don't recall the figure.

Q. Do you know what the present age of those four gas engines is?

A. About 35 years.

Q. Mr. Rhodes, do you remember discussing the other day [5962] [5963] the percent condition of the four gas engines located at Hastings station, which I told you appeared in your working papers?

A. I remember your asking me about them.

Q. Well, I have photostatic copies of your inspection sheets, and will you identify them and tell us what condition you have shown on each one?

First, may these be marked for identification as Exhibits 123–A, 123–B, 123–C and 123–D?

TRIAL EXAMINER. They may be so marked.

(The documents referred to were marked Exhibits Nos. 123–A, 123–B, 123–C and 123–D for identification.)

The WITNESS. These are the field reports of my assistant who inspected these engines, and the figures shown on these as representing the purely physical condition of the engines are, with respect to No. 1–A, 85.6 percent——

TRIAL EXAMINER (Interposing). What exhibit is that?

Mr. SPRINGER. That is Exhibit 123–D.

The WITNESS. Engine 1–B, 85.8 percent.

Mr. SPRINGER. That is Exhibit 123–C.

The WITNESS. Engine 2–C, 88.3 percent.

Mr. SPRINGER. That is Exhibit 123–B.

The WITNESS. And engine 2–D, 88.8 percent.

Mr. SPRINGER. That is Exhibit 123–A.

The WITNESS. These being the physical percent condition
5964 representing the extent to which the engines have worn out in service.

By Mr. SPRINGER:

Q. You added 2 percent, I believe, to that physical condition percent, did you not?

A. Not to each station, I determined the physical percent condition, or my assistants did, with respect to all of the stations; I adjusted them downward to reflect the cost of abandoning; I then made specific further reductions on account of causes which are self-evident in some of the stations; and then the whole overall resultant percent was again reduced 2 percent without reference to any particular station.

Q. Then your physical condition percent, shown by Exhibits 123–A; 123–B, 123–C and 123–D for these four gas engines located at Hastings, is about 88 percent?

A. I think it would average about that; yes.

Q. And I believe you testified that those engines are about 35 years old?

A. Yes; they are rather old now.

Q. Do you know what percent of the time those engines are used?

A. Not specifically. I do know that they are used solely for peak load purposes, and I would expect it might average about 1 to 2 percent of the time.

Mr. SPRINGER. I offer in evidence Exhibits 123–A, 123–B, 123–C and 123–D as part of Mr. Rhodes' cross-examination.

5965

Mr. COCKLEY. May I see them?

(Exhibits handed to Mr. Cockley.)

Mr. COCKLEY. No objection.

TRIAL EXAMINER. Does the City of Cleveland or the State of West Virginia have any objection?

Mr. REEDER. No objection.

Mr. KOONTZ. No objection.

TRIAL EXAMINER: Exhibits 123–A, 123–B, 123–C and 123–D are admitted in evidence.

(Exhibits Nos. 123–A, 123–B, 123–C and 123–D were received in evidence.)

## TESTIMONY OF F. P. C. WITNESS DUNN ON DEPLETION AND DEPRECIATION RESERVE REQUIREMENT

**Transcript Pages 2993–3010, 3052–3124, 3621–3699**

* * *

2993 Cross-examination by Mr. MILDE:

Q. Is it correct to say, Mr. Dunn, that your summary sheet in this exhibit is Schedule No. 1 on page 23?

A. Yes; that is the summary sheet of all figures.

Q. Now I want to deal this morning only with the depletion figures, as you have worked them out.

Now generally, in your work as you said, you applied this information which was submitted to you to certain costs, did you not, to arrive at your figures for depletion and depreciation and depreciation reserves?

A. Yes, we have segregated the company's costs into two general classes, depreciable and depletable.

Q. Now I notice in your first heading on Schedule No. 1
2994 that you say, "Cost subject to depletion and depreciation", and your next line is "Original Charges per Books", which, for the total plant in column (b), is $73,500,000?

A. That is right.

Q. Just what is that figure?

A. That figure is not actually used in any of these calculations, but in order to present the total amount that we have considered over this period of approximately 40 years,—that is, it is the total dollars, but it wasn't used in any method as such, and has no significance other than as a check for adjusted book costs at December 31, 1938; but it was not used in any calculations.

Q. That is just for general informative purposes?

A. That is right.

Q. And when you said before that you wanted to show the total dollars you were dealing with, does that mean the dollars that the company happened to capitalize on its books, is that what that figure means?

A. Yes, sir; the total investment in plant accounts.

Q. That is, it is whatever part of the cost of the company's properties it had capitalized?

A. That is correct.

Q. And that is all that figure represents?

A. That is all.

TRIAL EXAMINER. During its entire history?

2995 The WITNESS. Through its entire history.

By Mr. MILDE:

Q. Now what does line 2, "Adjustments by Examiners," represent?

A. That is an amount of $1,043,329.44, and I believe in the written statement there is an explanation of that amount, exactly what it is composed of and what it means, and you will find that on page 8.

Q. All I am trying to find out, Mr. Dunn, is what that represents, because page 8 merely says that the examiners made certain adjustments and lists the amount; and I just wanted some further indication of what the figures are, that was all.

A. Well, if you will look on the summary schedule of the original cost exhibit, you will find every examiner's adjustment listed there, made to the original cost, referenced by entry numbers which serve to identify each adjustment, and this amount is $2,099,171.81.

Q. Are these some items that were on the books which were capitalized, which you deducted in the course of the examiners' adjustments?

A. If you will notice, this is the result of the original cost study made by the company, the result of the examiners' check of it, and most of these adjustments are adjustments prepared as a result of the company's original cost study, but not

2996 put on the books, and in the main represent unrecorded retirements at December 31, 1938, but many other adjustments are included in there, too.

Q. But mainly unrecorded retirements?

A. In dollars, that is the largest amount.

Q. Well, I was curious, Mr. Dunn, as to why you deducted that figure from your line 1 to show an adjusted total cost subject to depletion and depreciation in line 3 of Schedule No. 1?

A. Well, we are going to bring that adjusted total cost down to the adjusted cost at December 31, 1938, and obviously we are going to take out of there the property that we took out in original cost in order to come to that figure.

Q. Well, that doesn't mean that the company doesn't have that property capitalized on its books at one time, does it?

A. Oh, no; by no means. I am just going down to the balance at December 31, 1938, and as I explained before, this $1,043,000, having been included in the total of $73,000,000, has received its share of depletion expense and accrued reserve, and it is charged off against the reserve by our entries.

Q. Well, we will come to that a little later. But what you say on your line 3, as I understand it, is that you had deducted from the amount of cost the company had capitalized on its books over the course of these years, $1,000,000, which consisted largely of unrecorded retirements, and you come to
2997 $72,500,000 which you say is the adjusted total cost subject to depletion and depreciation. You don't mean to say that depreciation and depletion should not have been taken on the $1,000,000?

A. No; I didn't have that in mind at all.

Q. Wouldn't it have been a little more accurate to include that in your line 4, if you were just wanting to come down to your adjusted book cost?

A. Yes, possibly having two sections of line 4 would show company retirements as recorded, and then these additional unrecorded retirements. That would have been perfectly all right.

Q. Well, actually you don't use any of these figures on Schedule No. 1, do you, Mr. Dunn, except line 5; adjusted book costs; that is, that is what you are dealing with here?

A. I use them all in this way—that this is just a grand total of them. I use them annually, year by year; they are all used, of course, and they finally work out to the $51,207,000 which was the adjusted original cost at December 31, 1938, and I put that in there to provide a complete tie-in to the original cost statement.

Q. Well, but the annual depreciation and depletion rates which you are developing, and the adjusted depreciation reserve which was developed, are applicable solely, are they not, to your
2998 adjusted book cost as of December 31, 1938, or adjusted book cost as of 1937 or 1939?

A. Well, yes; as of December 31, 1938, they are applicable as to the cost as of that year; and as of any other year, to the cost at the end of that year. You must understand that Mr. Antonelli, in his original cost study, didn't attempt to make his costs retroactive. He merely took the property that he found at

the end of 1938 and adjusted that property without making any retroactive adjustments.

Q. I just want to clarify, Mr. Dunn, what you say on pages 1 and 2, where you say that plant costs have been depreciated and depleted, respectively. Now what do you mean by "plant costs?"

A. I mean the cost is recorded in what is ordinarily known as fixed capital accounts, which we have considered as being gas plant in service. There are several ways of describing plant costs. We have had several accounting systems in the past, so they fall into different account numbers, but in general it is what is known as fixed capital items.

Q. Well, isn't this true, Mr. Dunn, that what you mean in this exhibit by "plant costs" is that portion of the cost of the plant that the company capitalized on its books?

A. That is right.

Q. And as of December 31, 1938, as shown in your line 5 on Schedule No. 1, your plant costs show precisely the same figure as adjusted book costs of $51,200,000, isn't that so?

2999 A. That is right.

Q. Now going a little further down your Schedule No. 1, Mr. Dunn, I notice that you have this same adjusted book cost figure, or plant cost figure, repeated in line 55 under column (b) for total plant?

A. Yes.

Q. Isn't that so?

A. Yes.

Q. And there you call it "adjusted original book cost." There is no particular significance to your various terminology, I assume; it is the same figure, is it not?

A. The same figure and same meaning.

Q. And that is the adjusted book cost in line 55 just as it is in line 5?

A. Yes.

Q. And your next item there is adjusted depreciation reserves, in line 56, of $23,500,000 for total plant. Now that is the figure you are attempting to arrive at in this exhibit, is it not? I mean, that is the result of your calculations in this exhibit, and your supporting papers?

A. That is one result; yes.

Q. And the other result is your annual allowance?

A. Yes; that is correct.

Q. Now in line 57 you show a figure of $27,700,000 as net book cost. That is deducting from your adjusted book
3000 cost the adjusted depreciation reserve as you have determined it, isn't that so?

A. That is right.

Q. And is that net book cost the net book cost of the company's total plant as defined in the Commission's Uniform System of Accounts?

A. To what definition do you refer in the System of Accounts?

Q. Do you have your code with you?

A. Yes.

Q. Well, I have noticed, Mr. Dunn, that in the definitions on page 4 of the Commission's Classification of Accounts, Exhibit No. 58, there is a definition for net book cost, item 24, which reads:

"'Net Book Cost', when applied to gas plant means the book cost less related depreciation, amortization and depletion reserves. When applied to other property, it means book cost less related reserves for loss in value."

A. That is exactly the same.

Q. And that is what you have in this exhibit?

A. That is right.

Q. And by that you mean you have the net book cost in accordance with the Commission's Classification of Accounts if its books were completely re-set as you and Mr. Pace and other members of the accounting staff have reset them in
3001 these exhibits?

* * *

3002 The WITNESS. The purpose of this study was not particularly directed with any thought in mind of resetting the books, and I believe I would have arrived at the same results as I did here, regardless of any System of Accounts. If I hadn't had this System of Accounts at all, I would still have gotten this same answer.

But I believe what you have in mind by your question is that if all of our adjustments were recorded, then the books of the company would reflect this amount of money. That is
3003 the way I believe you meant it.

By Mr. MILDE:

Q. And this is not the net book cost as shown by the company's books, or anything like that?

A. No, sir; that figure does not appear on the company's books.

Q. And this is simply a figure you arrive at by applying your own adjustments and determinations of depreciation reserves, and so on?

A. Applying both ours and certain adjustments proposed by the company itself.

Q. That is right. Now in arriving at your adjusted depreciation reserve, Mr. Dunn, as you show it for total plant, of $23,500,000, you say on page 7 of your text that all plant costs from the inception of the company have been considered in the depreciation and depletion calculations. Do you find that statement on page 7 under your heading, "Costs Subject to Depreciation and Depletion"?

A. That is correct.

Q. Now what you really mean there, don't you, Mr. Dunn, is that it is the plant cost which the company capitalized in the past?

A. That is right; I did not attempt to compute depletion on items charged to expense.

3004 Q. Well, you didn't mean by "all plant costs," the amount of money actually paid by the company for the plant, did you?

A. The amount actually paid has been very carefully distinguished by Mr. Smith in his testimony, that you can pay for two types of costs, expense costs and plant costs. I charged the plant costs, the amount charged for plant, in this depletion study.

Q. We are perfectly clear, aren't we, that what we mean is that portion of whatever was paid to construct the property which the company capitalized, and no other portion of the moneys that were paid out to build the property?

A. That is right.

Q. And that is all you meant by this statement on page 7?

A. That is correct.

Q. Now isn't it a fact that this adjusted depreciation reserve we are talking about here, as shown in Schedule 1, can be used only in connection with your adjusted book cost, as you show it in line 5?

A. That is correct, it is directly related to that book cost, and has no relation to any other figure whatsoever.

Q. And this might be called an adjusted depreciation reserve applicable to adjusted book cost?

A. That is right.

3005 Q. Now this same schedule No. 1 shows, does it not, Mr. Dunn, that of the total plant of $51,200,000, or rather the adjusted book cost of total plant in that amount, you have treated, by depletion methods or depreciation calculations, about $10,000,000, as shown in column (c)?

A. That is correct.

Q. Now isn't it a fact that the supporting schedule for the figures you show in column (c) to which I just referred, is Schedule No. 2 on page 25?

A. That is correct.

Q. And here in column (b) under "Total," and in line 5, we again find this approximately $10,000,000 adjusted book cost of depletable property which you show in Schedule No. 1?

A. It is exactly the same figure.

Q. Now this shows, does it not, that you treat by depletion methods, "Operated Acreage," "Field Line Right-of-way and Construction Cost," "Gas Well Construction," and "Cost of Abandoning Gas Wells"?

A. That is the various subdivisions of this depletion calculation.

Q. Now you don't show anywhere in this exhibit, do you, Mr. Dunn, the details, or rather the methods by which you arrive at these figures on Schedule No. 2?

A. There is a little further break-down of Schedule No. 2 shown as Schedules 2-A, 2-B, 2-C, and 2-D.

3006 Q. Well, that is merely a break-down under your general classifications of the figures you show in total on Schedule No. 2?

A. Yes.

Q. But doesn't explain how you did it?

A. No; that does not show the detailed calculations; just a summary again.

Q. And the text of your exhibit merely says that you applied the depletion rates which we have just discussed?

A. Yes.

Q. And that information?

A. Yes.

Q. But you have supplied to us your working papers?

A. Yes; my working papers are voluminous and I have given you all the underlying calculations to check.

Q. Now in view of the absence of an explanation of just what you did here, Mr. Dunn, I want to go over some of these items so that we all have an understanding of how you proceeded, and how you arrived at your final result. Now I notice under column (e) in Schedule No. 2, Gas Well Construction, you show your first figure for the year 1923; isn't that right?

A. That is right.

Q. And no depletion figures for any year prior to that?

A. That is correct.

3007 Q. Just why is that?

A. That is because all gas well construction was charged to some other account than plant accounts prior to 1923. In other words, there is no depletion expense because the entire cost of the plant represented by gas well construction has been charged to expense direct.

Q. Well, what it means, does it not, is that you are dealing in your study only with the wells whose construction costs have been capitalized since 1923?

A. Dealing only with those wells.

Q. And how many wells is that?

A. I believe somewhere in the neighborhood—I believe in the plant account we show a total of slightly over 700 wells.

Q. 772 is the figure; do you recall that?

A. I believe that is it.

Q. So what you are working out in column (e) of the Gas Well Construction, is a depletion allowance for 772 wells out of the company's 3,300?

A. I believe I will have to correct that a little bit. We also considered all the wells in which cost was capitalized and then the well was retired, we considered those wells in this annual allowance, also.

Q. I see.

A. There are not very many of those, however.

3008 Q. We will get to that in a moment. But what you finally arrive at for your adjusted depletion reserve in column (e) as shown in line 41, of $1,100,000, is a depletion reserve computed only for 772 out of the company's 3,300 wells?

A. That is applicable to those 772 wells.

Q. And that is all it is applicable to?

A. That is all; yes.

Q. And your depletion allowance, as you show it; say, for 1937 and 1938, is for those wells only?

A. No; it is for any wells that the company might have had at that particular date.

Q. Plus any other wells that may have been in existence at 1937 and 1938 which the company happened to capitalize?

A. That is right.

Q. And which hadn't gone out of service in 1937 and 1938?

A. Yes, sir.

Q. Now you say on page 9 of your text that your method or basis of depletion in connection with gas well construction is annual production, do you not?

A. Yes; I do say so.

Q. Now did you actually use the annual production from these 772 wells, or other wells capitalized since 1923, in determining your figures?

3009 A. I might say that we didn't separate the annual production by individual wells, we separated it by these production areas, and also about 75 or 80 individual wells. So therefore, I must answer that by referring to one particular pool, and then I can give you a more direct answer.

Q. Well, I think you can tell me generally what I want to know now, Mr. Dunn. You have considered, haven't you, the production and the reserves for all of the company's wells in your figures; you haven't merely confined your depletion rates on the basis of the production and reserves of 772 wells?

A. Well, I would like to give you an illustration. Production Area No. 1-1 had no well construction costs capitalized whatsoever in it, and I did not include any production figures from Production Area 1-1 in my calculations for depletion.

Q. No; but suppose, Mr. Dunn, that you refer to Production Area 6-1—what did you do there?

A. I used the production from that particular pool from 1923 on; nothing prior to that.

Q. Well, I think I ought to have a direct statement, Mr. Dunn. You know what I mean when I say, "Did you use only the production from these 772 wells for which you have costs in your book account, or did you use production for all of the company's wells"?

A. Oh, I said I used the total production from that pool 3010 area, which would be every well in there that produced gas from 1923 on.

* * *

3052 Q. Now I want to go back for just a minute, Mr. Dunn, to page 9 of your exhibit, where you say that the basis of depreciation and depletion as appearing on your table at the bottom of page 9 for gas well construction is annual production.

A. Yes.

Q. Now, suppose you applied whatever you meant by the words "annual production" to a single well, how would you determine the depletion and depletion reserve?

A. I would take the original cost of the well when it was first placed in service and would determine the rate based on the remaining gas reserve, the total in this case, and the annual production, and applying that rate to the cost of the well would produce an amount of expense, and that expense accumulates to build up a reserve. Any retirements from this well are charged to the accumulated reserve, less whatever salvage is recovered.

* * * *

3053 Q. Getting back to our well, Mr. Dunn, do I understand if you had one well you would ascertain from somebody probably a geologist, the probable total recovery in m. c. f. from that well?

A. That is correct.

3054 Q. Then you would get from an operating man the amount of production, either metered or estimated by whatever you could do, and determine what percentage that was each year?

A. Yes.

Q. And that is the percentage of production and the remaining reserve after deducting plant depletion?

A. Yes.

Q. Then you apply that to your original cost to set up a reserve in dollars?

A. The way it actually operates is you use the remaining gas and remaining book cost. That automatically corrects any slight error that might occur in the estimate of the reserve.

Q. If one-half of the gas has gone from the well, as a physical matter, what is the ratio of your depletion reserve to the original book cost, or to the original cost?

A. On a unit basis, one well would probably be 50 percent.

Q. Fifty percent?

A. Yes.

Q. Would you say that accurately measured the amount of depletion in that particular well as of that particular day?

A. Yes; that would be a very good measure.

3055 Q. It would be an exact measure, would it not?

A. Well, to the extent that the estimate was correct it would be exact. The estimate may be incorrect. Of course, it is absolutely impossible to get it exactly.

Q. Of course, it would depend on if you had the right reserve.

A. We are dealing in this case with estimates.

Q. So we have found out. Now, if you had 772 wells and obtained the correct recoverable reserve for those 772 wells, or as nearly correct as geologists could estimate them, and then treated the 772 wells as a group and following the same method you apply to an individual well, what would be the ratio of your depletion reserve to the original cost of those 772 wells when half of the gas was gone?

A. Well, it might be 50 percent or it might be less. It could not very well be over 50 percent.

Q. If it were to be an accurate measure, it would have to be 50 percent, would it not?

A. Of course you are assuming there are no retirements and no well out of these has been abandoned.

Q. We are talking about the 772 wells which are now in existence.

A. And all came in the same day and went into production the same day?

Q. That would not make any difference, would it?

3056 A. Oh, yes.

Q. Well, Mr. Dunn, whether they came in on one day or the next day, if you are dealing with 772 wells, you could total up your figures across and get the same result.

A. Some of them are drilled deeper, which would increase the cost, while the reserve may be either more or less than the well originally had. There are many problems involved in that.

Q. As a practical matter, if you had a total reserve of these 772 wells and applied the method which you have used for one well, your reserve should be about 50 percent when half the gas is gone, should it not?

A. Provided that we make the assumption complete and you never drill any well deeper or do not change your gas reserve in any way or do not bring in more gas reserves, and they all went into production the same day and were retired the same day, then I suppose that would be 50 percent.

Q. I am coming to that in a moment, Mr. Dunn. Now, that is not what you did in this case, is it?

A. No; it is not.

Q. Now, as a matter of fact, you did not use in working out your figures, the remaining recoverable reserves for these 772 wells at all, did you?

3657 A. I believe I identified the reserves I used and the geologist's report, and did not relate it to any particular well as such.

Q. Did you know precisely what was included in the recoverable reserve figures which you got from the engineering department or the geological department when you made your figures?

A. I relied on their description, which said present drilled wells as of December 31, 1938. That is the figure that I was using. I believe I did use the amount shown under that heading.

Q. Is it not a fact that what you did was to take these reserve figures that somebody gave you and which spread out the company's gas reserves and production, and so forth, by 76 pool areas and use the figure finally for total ultimate recovery of m. c. f. as your starting point?

A. I think the starting point was the amount of recoverable gas from present drilled wells as of December 31, 1938. That was the starting point.

Q. Then what did you do?

A. I took the annual production figures, not just production from present drilled wells, but all wells, and computed the amount of reserves at the beginning of each prior year.

3658 Q. And you worked out in that method the remaining reserve all of the way back to 1923; is that it?

A. Yes, sir.

Q. And that was worked out by your application of a correction factor that was supplied to you, was it not?

A. The correction factor, of course, was to convert production.

Q. You are not vouching for the accuracy of these reserve estimates at the end of each year back to 1923, are you?

A. Obviously they are correct. They are only just as far wrong as the last preceding one is wrong.

Q. And if the correction factor, for example, were inaccurate or could not be applied to each pool area, your calculations would carry through those errors, would they not?

A. To that extent there would be an error in each calculation.

Q. That is right. You took me rather far afield from my notes, Mr. Dunn, and I want to get back to them again. Now, in these reserve figures we have just been talking about, it is a fact, is it

not, that you included in them nothing for deeper drilling of these present wells?

3059 A. That is the figure shown directly underneath the estimated production from present wells, is it not? Is that the figure to which you refer?

Q. I just want to know what you used.

A. As I stated before, I used only the reserve from the present drilled wells as of December 31, 1938.

Q. As they were then drilled?

A. Yes.

Q. If those wells were drilled deeper, you did not take account of any such additional production?

A. That would automatically follow. If you spend more money, you get more gas, and it goes into the rate automatically when that occurs. Of course, we do not take account of it before it happens.

Q. Is it not a fact, Mr. Dunn, your geologist estimated what the recoverable reserves would be from deeper drilling of present wells?

A. Yes.

Q. And you just discarded that figure, did you?

A. No.

Q. You did not use it, did you?

A. It does not apply yet. It applies when deeper drilling occurs.

Q. You did not use it at all?

A. No.

3060 Q. It is your theory if you drill a well down to 1,000 feet you just use the reserves that you get then for that well and all of the other wells in the vicinity and work out a depletion rate, and then you drill it down about 1,000 feet and you add your additional reserve at that time?

A. Obviously you add some cost for that expense, but you also get more gas and you add the gas and it therefore keeps in relationship. It is a very simple matter.

Q. That is not what you actually did for past years?

A. It was not necessary in past years. In fact, I did not have the figure broken down and it would be necessary to go back and separate all of those years out and go through all of them.

Q. You just did not do it in the past and you say that is the way to do it in the future?

A. As a practical method, rather than recompute the whole thing every year, you just add to it year by year. Why compute the whole schedule when it is unnecessary?

Q. Mr. Dunn, do you recall that Mr. Ross put in an additional gas reserve exhibit giving some figures for December 31, 1939?

A. Yes; I have seen his exhibit for 1939.

3061 Q. You are aware, are you not, that in that exhibit he made some changes in his previous estimate of recoverable reserves, drilled wells, pool areas, and what not?

A. I could not tell whether he made changes in his reserves or whether the figures were incorrectly computed, mistakes of addition. I did find many of them and he advised me there were many changes in addition. I could not tell whether it was a change in estimate or a change in addition, but they were very minor.

Q. That is your opinion?

A. I heard testimony by Mr. Ross that three or four percent of the total was a minor matter, and this could not be one-half of one percent; so it must be minor.

Q. Well, is it not a fact that on your method of calculating depletion on wells and on the other properties we are going to come to in a moment, you have just assumed that the reserve figures as of December 31, 1938, are accurate?

A. Yes, indeed.

Q. And to the extent that additional developments of the gas territory indicate, for example, in 1939, inaccuracies in those estimates, you have not taken them into account?

A. Well, I would take them in account when they develop.

3062 Q. You did not make any revised figures as of 1938 on account of Mr. Ross' changed figures in 1939, did you?

A. I do not know what the changes are yet.

Q. And you have not investigated that?

A. What?

Q. You did not investigate that?

A. Mr. Ross informed me there were some, and he has not given me the absolute amount as yet that I know of.

Q. Now, getting back finally to the first question I asked you when we started off, Mr. Dunn, is it not a fact that so far as working out the depletion allowance and reserve for these 772 well is concerned, you have actually considered the production and the recoverable reserves from all of the company's 3,300 wells, with the exception of such of the company's 3,300 wells as

are in pool areas where none of the well drilling costs happen to be capitalized?

A. And the further exception that no production goes back prior to 1923.

Q. That is right?

A. That is correct.

Q. Do you know how many of your pool areas have wells in them for which you have no construction costs
3063 whatsoever?

A. I would have to go through each one and see. I do not think there are many of them.

Q. You do not think there are many?

A. No.

Q. So, with these exceptions that we have made, is the general statement you have used the 3,300 wells, and that those exceptions are very minor?

A. Yes; in fact, it is all very minor.

Q. Now, turning to your schedule No. 1—first, referring back to your schedule No. 2 on page 25, your column "D" shows your computations for field line rights-of-way and construction costs, does it not?

A That is correct.

Q. Now, did you group these particular properties into pool areas the way you did your wells?

A. Yes; in a similar manner to the wells.

Q. You did that personally?

A. No; not personally. Several examiners of accounts did that, and they did it from the data furnished by the engineering division as to the location, by production areas, of the physical property.

Q. That is what I want to be sure about. Is it the engineering division, Mr. French or Mr. Brown or whoever it is—
3064 is it the engineering division grouped these properties, with you doing the mathematical work, or accounting?

A. It is the engineers who have designated the items of property by the various production areas.

Q. I see. Did they tell you to group these properties into pool areas, or did you tell them to give you the figures by pool areas?

A. I do not believe I know. It was probably decided in a conference in some way to arrange these 73 pools and this depletion, and I do not know who was primarily responsible for the first suggestion, if it might be called that. It certainly was not me because I was not here when these 73 areas were arranged.

Q. You are a recent arrival on these fields, are you not, Mr. Dunn?

A. October 21, 1940.

Q. So I judge from what you have said you are not taking responsibility for this general process of segregating the company's properties into areas, production areas; is that right?

A. I would not want to disclaim that or say I do not believe in it. I believe it is perfectly proper.

Q. Proper for what?

A. As a method of depletion and determining the amount of accrued reserve.

3065 Q. Is it an application of what you call the group method?

A. Yes.

A. I see. Would it not be an application of the group method just to group all of the company's properties into one series of depletion and depreciation calculations?

A. Yes; that would be a larger group.

Q. A larger group?

A. Yes.

Q. Do you think it necessary that the company's properties be split up into these particular pool areas in order to apply your group method?

A. It is not absolutely necessary. I would say that this is a refinement; because we wanted to know whether or not there would be any material difference, and I do not think now that there would be. But this is a refinement of a problem, for added accuracy.

Q. Well, this is something intermediate between the group method and the unit method; is that is?

A. I do not believe you could relate it in any way to the unit method. It is a refinement of the group method, I would say.

Q. Are you taking responsibility for this particular method of grouping these properties?

A. No; I do not know enough about the underlying

3066 geology to take full responsibility, but assuming the geologists are correct, I would take full responsibility for any computation of cost by reason of this grouping.

Q. All right. Now, what geological assumption has to be correct in order to have these pool areas segregated?

* * *

3070 Q. I think the question, Mr. Dunn, which we were discussing, is that your assumption was that it was not necessary that the production and reserves of pool areas and individual

wells, as you have classified them, be accurate, so long as the over-all production and reserves were accurate; is that right?

A. Maximum accuracy is desirable, but not absolutely necessary.

Q. And it is your testimony, is it, that if there are errors as to the production and reserves of any one or more of your individual pool areas, or individual wells, that that is immaterial?

A. Errors in estimates of gas applicable to the gas reserves?

3071 Q. That is right.

A. I believe it would be rather immaterial, it might play some part in the final answer.

Q. Now on what do you base that belief?

A. Largely because we have not taken out or eliminated any part of the total, it is all in there, and if the division is wrong, it means that one is too high and one is too low, there would tend to be an offsetting error.

Q. You don't know whether those errors will offset each other or not, do you, Mr. Dunn?

A. Not exactly.

Q. Do you know at all?

A. Yes, sir; that is exactly what, it would be, an offsetting error.

Q. Now, Mr. Dunn, offsetting errors, you know, do you not, as an accountant, could never balance each other if you are dealing with segregations of property into unequal units?

A. That is right. I testified that they might not exactly offset, but they would tend to offset.

Q. And isn't it a fact that the pool areas shown on Exhibit No. 41, and the property in these various pool areas as they appear in the original cost exhibit, 57, are very unequal?

A. Yes; they are very unequal.

Q. In some places you have got very little property,

3072 and in some places you have got a great deal of property?

A. Yes; that is right.

Q. Now as I recall it, you said that that was the only assumption, that is, the accuracy of an over-all estimate of production and gas reserves was the only assumption that you needed to consider as being accurate in order for you to say that you thought this division into pool areas, and so on, was proper; is that right?

A. I would prefer to let the geologists testify as to the division into pool areas. That is just my opinion, but the accuracy of these pool areas is up to the geologists, not up to me.

Q. But you have expressed an opinion, Mr. Dunn, and I want to know whether that is the only thing, the accuracy of that over-all estimate is the only thing that you think needs to be accurate, in order to support your view, as you have expressed it, that this division into pool areas is proper for the purposes for which you used it?

A. No; my view is that accuracy should extend down to the ultimate refinement if possible, but it may not be possible, and it may not happen that way. The most desirable and the most important accuracy is desired in the total. I would like to have it as accurate as possible, that is my position.

Q. Well, I am asking you if all that you think is necessary in order to support these pool areas, applied as you
3073 applied them, is an accurate over-all estimate of production and reserves?

A. No; I needed what I got, and that is a break-down of those reserves by production areas. I needed that in order to make my computations, and a reasonable break-down, particularly.

Q. Well, Mr. Dunn, when you assume that this pool area method, let us call it that, is proper—or rather, you have expressed your opinion that it is proper—do you not have to assume something as to the operation of the companay's properties?

A. Well, I think the operation of their properties up to 1938 is a fact, and it doesn't require any assumption.

Q. Well, that is just what I want to go into and inquire about, Mr. Dunn. Don't you have to assume that the properties which you have segregated into pool areas are operated in a particular way?

A. The method in which I have considered them as being operated is all reflected in the amount of gas withdrawn.

Q. Well, precisely what did you assume, then, either in expressing your opinion that this was proper, or in using these figures, as to the operations of the company by pool areas?

A. I didn't assume anything further than is shown in these depletion schedules.

3074 Q. And what is shown in your depletion schedules as to the operations of the company by pool areas?

A. The amount of gas withdrawn and the amount of gas remaining at December 31, 1938.

Q. That is the only thing that is shown in your exhibit?

A. Well, from the operating side. Of course, from the plant side there is the investment in the pool areas, which changes year by year—wells are added and wells are retired, or field lines are

added and field lines are retired, and it is continually changing.

Q. And the only thing you have assumed is that gas is produced from these 76 pool areas and 100-and-some individual wells, is that right, so far as an operating fact is concerned?

A. I don't think I have even assumed that; I think that that is what actually happened; that gas was withdrawn from these areas.

TRIAL EXAMINER. The use of that word "assumed" has certainly got me confused. I don't know whether it has the witness, or not.

Mr. MILDE. I will see if I can't clear that up.

By Mr. MILDE:

Q. On your own theories and computations, don't you have to assume that these properties which you have segregated into pool areas are used solely and exclusively to produce gas from that pool area?

3075 A. In the case of wells, I would say yes; but in the case of field lines, it could well happen that a field line in one or two instances might extend over into another production area.

Q. Well, isn't it a fact, Mr. Dunn, that you deplete field line construction by pool areas on the assumption that when the gas is gone, as other members of the Commission's staff gave it to you, that that line will be completely out of service; the lines in that pool area will be completely out of service?

A. On the theory or assumption that the construction costs will have no further value.

Q. That is right, and you make that assumption that when these gas reserves you have worked with by pool areas are gone, that the construction costs of the lines which you have assigned to that pool area, will have no further value?

A. Yes; that is right.

Q. And that assumes, does it not, that the lines in each of these pool areas will carry no gas other than that which you used in your computation for each particular pool area?

A. No; I wouldn't go that far, because in each case, if there is any doubt as to it—and this is what the engineers have told

3076 me—if there is any doubt as to the length of life as between various production areas through which a field line might operate, they have assigned that field line to the production area having the longest life that they can possibly determine.

Q. Mr. Dunn, that isn't responsive to my question at all. You are talking about lines outside of pool areas.

A. No.

Q. We haven't come to that yet. Now what I want to know is this: Isn't it a fact that you have assumed that when these gas reserves which somebody gave you, by pool areas, or which you converted into actual reserves by this 70 percent factor, is gone for each pool area, that the construction costs capitalized of field lines and rights-of-way of the lines in that pool area, will never serve any other purpose?

A. I think that that is generally true.

Q. That is a necessary assumption in your calculations, is it not?

A. Yes; that is right.

Q. Now are you taking responsibility for the accuracy of that assumption which is inherent in your calculations, or is somebody in the engineering staff doing that?

A. Well, I suppose the responsibility is on anybody making use of those figures; partly on me, partly on them. I would be
3077 glad to assume responsibility for the fact that when gas is gone, the field lines won't transport any more.

Q. That is all you know about it, however, isn't it?

A. That is all.

Q. You have made no investigation of the actual operations of the Hope Company, have you?

A. No; I have not gone out and looked at them.

Q. And if I went to any particular pool area on Exhibit No. 41, which you say you are not familiar with, and asked you how the lines of the company in that pool area were actually operated, you would [illegible] to tell me, would you?

A. No; I wouldn't be able to tell you that.

Q. Now, if it is a fact that some of the property which you list in any one of your pool areas, and deplete by your method, actually carries gas produced in one or more pool areas, your results are not accurate for that particular property, are they?

A. Yes; I think so, because that factor has been given consideration by the engineers, and I am informed——

Q. (Interposing.) Well, you think it has been given consideration by the engineers; isn't that what you are saying, Mr. Dunn?

* * *

3085 Q. Now isn't it also true, Mr. Dunn, that your method of calculation assumes that the existing lines which you
3086 have assigned to these pool areas would not help carry any gas from any additional wells drilled on operated acreage other than the wells drilled at December 31, 1938?

A. I think my method contemplates that there will be additional wells drilled.

Q. Well, did you——

A. (Interposing.) I fully expected that.

Q. Well, it is perfectly clear, is it not, Mr. Dunn, that in the total recoverable gas reserves that you used for a pool area, you did not include in that total any reserves from any additional wells that would be drilled on operated acreage after the end of 1938?

A. That is correct.

Q. Isn't it also true, Mr. Dunn, that your calculation assumes that these lines, which I described in the preceding question, will not help carry gas from any of these wells existing at December 31, when they are drilled deeper?

A. It certainly does not assume that.

Q. Well, Mr. Dunn, did you include in the total recoverable m. c. f. to which you applied your withdrawals, any gas at all for additional or deeper drilling of wells?

A. No; I explained this morning that when the wells are drilled deeper, those reserves, if any, will be added to the total recoverable gas at the time they are actually obtained.

3087 Q. We are not talking about wells, Mr. Dunn, we are talking about field lines.

A. I have used exactly the same rates on field lines, operated acreage, and leases, they are all in the same rates, and the recoverable reserves are determined by the wells themselves.

Q. And the fact is that the ratio of withdrawals by pool areas or depletion rates that you figured out for 1938, for example, assumes that that rate of withdrawal is a definite percentage of total recoverable reserves from the area, which do not include any reserves for additional drilling or deeper drilling; isn't that so?

A. That is so. There is very good reason for not including them.

Q. Well, the fact of the matter is that you also have not included, in your total recoverable reserves which you have used in your calculation, any of the gas which will be found in any of these pool areas by additional wells drilled on unoperated acreage; isn't that so?

A. Yes, sir; I have testified all the way through that the only gas reserves that I have used are the present existing wells as of December 31, 1938.

Q. And you also haven't included in your base figure, let us call it, your total recoverable reserves for pool areas, any gas that
3088 will be found in those areas in the future, or obtained in the future by additional wells that the company may purchase; isn't that also true?

A. Yes; that is absolutely true. I might add that it is highly desirable, in my theory and opinion, that such additional reserves not be added at this time.

Q. Well, the fact is that you have used a figure for total recoverable reserves from a pool area, and applied to that figure over the years the production, have you not?

A. I believe I explained that once before, that I used the recoverable reserves from the present existing wells as of December 31, 1938, and I have used the total production to date in connection with that reserve.

Q. And the figure for probable total recovery in m. c. f. by pool areas, which you used in your calculations, isn't the probable total recovery for that pool area at all, is it, as a matter of fact?

A. It is the probable total recovery of the present wells. As additional wells are purchased, if they are purchased, that additional reserve would be brought in, as it has been in the past, and the cost will be added in the year in which it was incurred, as it has been in the past; and depletion would be directly related then; the expense would be directly related to the cost in the year in which it was incurred.

Q. In other words, to apply your method, you have got to do something else than what you have done here, is that it,
3089 in the future?

A. No; I have just got to continue what I have done here.

Q. Well, Mr. Dunn, you have one of your pool areas in which you have fully depleted your line construction and rights-of-way, haven't you?

A. I believe there is one pool area where all the gas that was estimated has been withdrawn.

Q. And on your method there may be others, isn't that right?

A. Eventually there will be others.

Q. And that method assumes that the rights-of-way and lines in your one fully depleted pool area, which is Area 2-2, I believe, that assumes that they have no value, doesn't it?

A. That assumes merely this, that all the cost that has been capitalized has now been charged to operating expenses at the same time that all the gas was recovered from that pool area.

Q. Well, now, Mr. Dunn, that hasn't actually been charged to operating expenses, has it?

A. I am afraid that a great deal more than that has been charged to operating expenses.

Q. Well, now, what happens to Pool Area 2-2—where at least you have no value for that property—when an additional well is drilled in that pool area?

A. I am assuming that the additional well would find
3090 some gas?

Q. Oh, yes; surely.

A. Then the cost of that additional well would be written off over the gas that is obtained from it.

Q. And the fact of the matter is that if these present lines are used to help carry the gas from that additional well, you have overstated there the reserve they ought to have at the end of 1938, haven't you?

A. Possibly a little bit overstated it in the interests of conservative accounting.

Q. Now in that same pool area 2-2, Mr. Dunn, I think your work sheets show that although you had depreciated or depleted the rights-of-way and field lines down to zero, there was actually some additional production from the capitalized wells in that area during 1939; isn't that right?

A. If so, it would result in only a minor error in the total amount of gas recoverable; it might happen in any case.

Q. Well, the fact is that your 100-percent depletion reserve as of December 31, 1938, was not accurate; isn't that so?

A. I have never pretended that this depletion reserve is absolutely accurate, because it is based on an estimate, and to the extent that an estimate is slightly off in the final analysis, may throw the reserve off a little bit.

3091 Q. Well, isn't that just the point, Mr. Dunn, that you have used, for determining field lines and rights-of-way, probable total recoveries in m. c. f. for pool areas which do not take into consideration any additional gas that will be discovered, or anything of that sort, additional purchases, and so on?

A. Yes; my method contemplates writing off present existing property over present existing gas reserves, and if additional gas reserves are added, additional costs naturally are incurred, and they will be considered at their proper time, not before then.

Q. Well, Mr. Dunn, isn't that also another point in your assump-

tion—you have just assumed that the present existing property—and when I say "you" I mean nothing personal. I mean that your calculations assume—that the present existing property, as you set it up, will not help carry or produce any of the additional gas supplies which the company will develop in these various production areas?

A. No; that isn't necessarily true.

Q. You don't think that that is necessarily true in your figures?

A. Why, I am sure that it isn't, because it is obvious that a great many of these pools, not being fully depleted, we have added reserves which tend to extend or lower the rate, and they continue in operation.

3092 Q. Well, you have just assumed, though, in these figures, where you are trying to arrive at a depletion reserve as of December 31, 1938, that these rights-of-way and lines that we are talking about now, will not carry any gas other than the reserves remaining in the present drilled wells as of December 31, 1938; isn't that so?

A. No; that is not so.

Q. Well, what reserves did you use in your calculations, what recoverable reserves did you include in your calculations?

A. The recoverable reserves at the beginning of each and every year, from the beginning of operation of the company to and including 1938.

Q. And excluding in your calculations any reserves that will be added by additional drilling, deeper drilling, and additional purchases after 1938; isn't that so?

A. Excluding such reserves and any such costs incurred in connection therewith.

Mr. Springer. He has answered a similar question three times.

Trial Examiner. Yes; I agree with you. I think we have gone over that three or four times already, and it should be clear by this time.

By Mr. Milde:

Q. Was it your thought, Mr. Dunn, that when the existing field lines of the company were laid, they were installed
3093 with the idea of merely carrying the gas which the company had discovered up to December 31, 1938?

Mr. Springer. I object. That is really an operating question.

Trial Examiner. Well, I think as it is worded, it is. The objection is sustained.

By Mr. MILDE:

Q. Well, did you assume in making your calculations, Mr. Dunn, that that was the situation?

A. No; I assumed that they would carry gas as long as there was any gas for them to transport.

TRIAL EXAMINER. You didn't assume any conditions which might arise subsequent to that date, though, did you?

The WITNESS. Well, I let those conditions be applied in the year in which they occurred.

By Mr. MILDE:

Q. Well, you haven't given any consideration at all, have you, in your figures for December 31, 1938, to additional gas discoveries in 1939 and 1940?

Mr. SPRINGER. That is the fifth time, Mr. Examiner, the same question for the fifth time. I think half a dozen ought to be the limit.

TRIAL EXAMINER. Objection sustained.

By Mr. MILDE:

Q. Now, Mr. Dunn, suppose you were doing this job of 3094 yours as of December 31, 1940; would you then, in your figures for probable total recoveries in m. c. f. for these various pool areas, include the additional discoveries that the company made in 1939 and 1940?

A. Yes, sir.

Q. And isn't it a fact that as to any of your pool areas, where substantial additional discoveries or purchases were made, your probable total recovery in m. c. f. would necessarily be higher than as of December 31, 1938?

A. I don't believe it would change. The way I would compute 1941 is just add 1939 transactions onto it and 1940 transactions, and come to the answer at the end of 1940, just continue from 1938 on.

Q. I am just asking you, if you did this job as of December 31, 1940, just the way you did it as of December 31, 1938, then, in any of your pool areas where the company had discovered substantial additional reserves, or had purchased substantial additional reserves, you would have, as one of your figures, would you not, a larger probable total recovery for that pool area—we are clear that far, are we not?

A. I believe so.

Q. You would have a larger figure?

A. That is right.

TRIAL EXAMINER. You just assume that you would, don't you, you don't know whether you would or not?

3095 Mr. MILDE. I said if the company discovered the additional gas.

TRIAL EXAMINER. Well, that, it seems to me, is an engineering question, there might be other things that entered into it. However, if the witness thinks he can answer the question, he may go ahead.

Mr. MILDE. Well, I think he has answered it.

By Mr. MILDE:

Q. That figure would be larger than what you had for 1938 on these assumptions I have given you?

A. If you had more reserves, you would get a larger figure, that is sure.

Q. Now isn't it a fact that if you took that figure and worked this computation back over the years, just as you have actually done it for the period up to 1938, that your depletion reserve, as of December 31, 1938, would be different than what you show here?

A. If I used different figures, I would get a different answer, I suppose.

Q. And isn't it a fact, and necessarily true, that if you made this calculation as we have described it, as of December 31, 1940, your depletion reserve for this pool area, this hypothetical pool area we have been talking about, would be substantially lower for December 31, 1938, than the one you show by working your figures up only to 1938?

3096 A. That is not true.

Q. You say that is not true?

A. That is not true; they would not be substantially lower.

Q. Would it be lower at all?

A. There might be some very slight difference, I couldn't say, not having computed the figures you have in mind, but there would be no substantial difference whatsoever.

Q. And your testimony is that it would not be lower?

A. Substantially lower.

Q. What do you mean by "substantially"?

A. You used the word, I mean the same thing you meant.

Q. You say it would be lower, but you are not sure it would be substantially lower; is that your testimony?

A. Of course, I might rescind the entire answer and say that to get more gas reserves you might require considerably more expense, and it might change the entire set-up. I don't know how it would affect that. In each particular change in pools, there is a change three ways, there is a change in cost both by additions and retirements, a change in production, and a change in the ultimate recovery or the remaining reserves, and all of those would affect the answer.

Q. Well, on the case we were assuming, Mr. Dunn, what are all these additional costs, and so on; isn't it a fact that we
3097 have assumed you have got the same pool area and the same wells that you had in 1938 except that you have now gotten some additional gas reserves in 1939 and 1940? We don't change any of the figures back of 1938 in our assumption.

A. My understanding of this method is that in order to get additional reserves, you must drill more wells or acquire more acreage. That would represent a change in cost.

Q. Well, did you understand my question, Mr. Dunn, that I was asking you whether, if you redetermined these figures for this pool area that we have been talking about, whether your reserve as of December 31, 1938, would not be different than if you had computed it on your method only up to December 31, 1938?

Mr. SPRINGER. I object again to the question and answer. It is the same question over and over again, and he has already answered that question.

TRIAL EXAMINER. Read the question, please.

(The question was read by the reporter.)

Mr. SPRINGER. He has already answered that, Mr. Examiner.

TRIAL EXAMINER. I am not sure that I understand the question, so I don't know whether he has answered it before or not. The objection is overruled.

The WITNESS. Due to the fact that all the underlying conditions might change, I do not know what the result would be.

By Mr. MILDE:

3098 Q. Now, Mr. Dunn, in the case of your depletion computation for gas well construction, you charged against your hypothetical depreciation reserve, as you were calculating it, the wells that had been retired, did you not, in the year in which they were retired?

A. That is correct.

Q. And you did that by individual pool areas?

A. Yes.

Q. That is, you analyzed what had happened actually as shown by the books for these various areas which you have labeled "pool areas"?

A. Production areas.

Q. Now you didn't do this in the case of retirements of field lines, did you?

A. I did not. My answer might be misunderstood. I did charge all the loss on retirements of field lines to the accumulated reserve, but I did not assign them to pool areas.

Q. Now will you point to the page in your Exhibit 61 where you worked that out?

A. What page?

Q. I am asking you what page it is.

A. Where I worked it out or where I set it out?

Q. Set it out, referring to lines—isn't that on page 29?

A. That is correct.

3099 Q. And isn't it shown under your heading "Property Retired"?

A. That is correct.

Q. Now is that a correct statement of what you did, Mr. Dunn, you took field line and right-of-way retirements which had occurred in the past all over the company's system, and found that they were $695,000 as shown in your last figure on column (ff)?

A. That is correct.

Q. Now actually, those retirements occurred in various ones of your production areas, did they not?

A. At least the large part of them must have.

Q. Well, didn't all of them?

A. There might be lines to individual wells outside of production areas, there are many purposes of field lines.

Q. Now isn't it a fact that if you had charged these retirements against your depletion reserves for your individual pool areas, that you would have had a lower adjusted depletion reserve as of December 31, 1938, than you have now?

A. I believe the tendency would, in that case, have been to lower the reserve, and also lower the expense in those particular years, lower the expense and likewise lower the reserve somewhat. Of course, it is utterly impractical to do such a thing, there are about 12,000 of these lines.

Q. And because it was impractical, you say you didn't

3100 do it?

A. That is right.

Q. Although it would have resulted in a lower depletion reserve than what you show?

A. Possibly a slightly lower one.

Q. Well, now, what caused that impracticality, Mr. Dunn?

A. The great number of field lines involved.

* * *

3101 Q. As I understand the situation, if you had charged retirements in the past against the pool areas in the case of field line construction and rights-of-way, as you did wells, you would have arrived at a somewhat lower depletion reserve as of December 31, 1938?

3102 A. I would have arrived at a somewhat lower annual expense and a somewhat lower depletion reserve, somewhat.

Q. You mean an annual expense all the way back to 1898?

A. Including the years under consideration now and all prior years.

* * *

TRIAL EXAMINER. Did you testify that you would have gotten a more correct answer had you broken it down into pool areas?

The WITNESS. I believe a little bit more correct answer.

TRIAL EXAMINER. And the reason you didn't do that is because it wasn't practical?

The WITNESS. Yes; I gave very careful consideration to

3103 the problem of breaking it down by pool areas, and in view of the actual conditions it would have required a great amount of time. This is a very small amount of money involved in relation to the total here, and the amount of time involved would have been entirely disproportionate to any answer that would be possibly changed. It is an utterly minor point.

* * *

Q. Referring to page 28 of your exhibit, I notice that you lump your depletion figures prior to 1913 all in one group, isn't that so?

A. That is correct; we did that.

Q. And isn't it a fact that what you did was to take the capitalized costs that existed in 1913 for Rights-of-Way and Field Line Construction, and applied to that the ratio of withdrawals from 1898 up to 1913 in one lump figure as applied to the reserves for that period?

A. Yes; we treated the period 1913 back to 1898 just as if it were one year, instead of many years.

Q. Now, that method of treatment necessarily assumes, does it not, that the property in existence in 1913 had helped carry gas from various production areas right from 1898 on,
3104 or whenever the first production began in each area?

A. Well, I wouldn't say that, because this is strictly on a unit of production, and has little reference to years, back in those early days especially.

Q. Well, suppose a line was installed, a field line, in 1912; you apply something like a 90 percent depletion factor to that line, don't you, in your 1913 figures?

A. If it happened to be in a production area of which there was one that in 1913, 90 percent of the gas had been withdrawn, 90 percent of the cost was written off in 1913.

Q. So that line which I have been talking about, installed in 1912, you would write down on the assumption, would you not, that it had helped carry gas right from the beginning of the gas producing operations of the particular area?

A. It was on a unit-of-production method, and it so happens that it covered a period of 13 years, and possibly you could draw such an inference. I don't know that I had to assume that. I mean, if that much gas had been drawn in one year, I would have gotten exactly the same answer as if it had been drawn in 13 years.

Q. Well, Mr. Dunn, it isn't very accurate, really, is it, to lump all the years from 1898 to 1913?

A. I wouldn't have done it if I could have avoided it, but that is one of the characteristics of this company, that no gas
3105 was metered or calculated, prior to 1913, as far as I know.

Q. That is as far as you know?

A. Yes.

Q. You made no investigation to ascertain, I assume, whether or not the right-of-way and field line costs which you started with in 1913 had actually been installed right from the beginning of the gas-producing activities, did you?

A. Oh, we actually had the figures before us by years from the inception of the company, so I knew exactly when all costs were incurred.

Q. So that you do know that a substantial portion of the right-of-way and field line investment was not made in 1898 when production activities first occurred, but was scattered throughout the years right up to 1913, don't you?

A. They were scattered, that is correct.

Q. Let me ask you, Mr. Dunn, if, in your computation also, you didn't use the costs as you set them up for January 1 of each year, to apply a depletion rate?

A. That is merely a mathematical computation. On depreciation we use average costs. Here it would be absolutely incorrect to use that, because we take the remaining costs over the remaining reserves, and we take the costs at December 31, less the amount accumulated, before any provision is made during the current year, and apply it. That is mathematically correct—any other method would be wrong.

3106 Q. Well, isn't it a fact that you assume, in that method, that property installed at any time during the year has helped carry gas from the first of the year?

A. Time doesn't play much of a part in this, as such; it is the amount of production that is really important.

Q. I am asking you whether that isn't an assumption inherent in your method?

A. If I was getting cost by months, for instance, I would take the amount that I computed at the end of the year, and divide it by 12, and I would get the amount of depletion expense each month.

Q. Can't you answer my question, Mr. Dunn?

TRIAL EXAMINER. Just what did you do here?

The WITNESS. Oh, I took the balance of the investment account at the end of the year, less the accumulated reserve as at the end of the year, but before current provisions were made, and that is the amount I applied the rate to.

By Mr. MILDE:

Q. And that includes, does it not, moneys that the company has spent in the summer and fall when it was building lines?

A. That includes both additions and retirements during the year.

Q. Now I notice that on your table here on page 28, in line
3116 34, you have an item of "Reserves Acquired" in the amount of $126,000.

A. Yes, sir.

Q. Now as I understand it, what you have done on these accounts is to compute what I would call a hypothetical depletion reserve of $2,992,000, and then you add to that the reserves acquired; is that right?

A. The $2,992,000 is the sum of the annual provisions to expense, that is what would be charged to expenses, and there is an

amount of $136,000 which is reserves acquired, as you have stated, added to that.

Q. Well, now, that increased your depletion reserve by $136,000 over your other calculations; isn't that so?

A. That is correct.

Q. Now that is the reserves that the Hope Company acquired or put on its books, is it not, in connection with the rights-of-way and field lines purchased by it from other companies?

A. Yes; the one company, the Clarksburg Light & Heat.

Q. And by adding it to your reserves, you have assumed, have you not, that the reserves that the Clarksburg Light & Heat Company had set up, and which Hope in turn set up on its books, correctly measured the depletion in those acquired lines as of the date of the purchase?

A. Yes; I think that that is a very correct figure as to the depletion existing in those lines as at that date.

3108 Q. Well, did you make any investigation of that, Mr. Dunn?

A. You mean recomputing the reserves set up by Clarksburg Light & Heat?

Q. I am asking whether you made any investigation as to whether that inherited depletion reserve correctly measured the depletion on your theory, of the properties acquired by the Hope Company from Clarksburg Light & Heat.

A. There was no investigation required on my part; I knew it did.

Q. Your theory is whatever the Clarksburg Light & Heat Company set up on its books for a reserve in connection with field lines and was transferred to the Hope's reserves, correctly measured the depletion of the properties purchased by Hope, is that right?

A. Yes; this is entirely a cost transaction as of 1929.

Q. What you do in effect there, Mr. Dunn, is to put into your accounts here, merely the purchase price which Hope paid for those properties?

A. Yes, sir; Hope's plant cost and reserves are stated on a cost basis.

Q. So that for field lines and rights of way purchased by Hope from Clarksburg Light & Heat Company and in

3109 existence at December 31, 1938, you have the purchase price less any depletion figures in respect to that purchase price

which might be included in your figures from 1929 on; is that not so?

* * *

A. I do not have anything less than the purchase price; I have the original cost less reserves, which equals the purchase price.

Q. You have depleted that property since then in your figures from the time when the Hope Company took over these properties, have you not?

A. That is right. All of those figures equal the purchase price in 1929, and subsequent to that I have depleted them the same as any other property of Hope.

Q. So what you have finally is the depleted purchase price in your final figure?

A. That is correct.

Q. I notice on this table which we have been referring to, subschedule No. 2-b, on page 29, that you deal with what you call individual wells and marketing lines and purchasing lines in columns CC, DD, and EE. What is the fact as to your treatment of individual wells?

A. That means lines to individual wells and there is not 3110 a terrific amount of cost involved here, and rather than deplete each one of them separately on the basis of the estimated gas reserves for each individual well, I have grouped them and depleted them on the basis of the total gas reserves of these individual wells and the total production of these individual wells.

Q. How many individual wells are there?

A. There are quite a few. I believe there are 75 or 80, and maybe there are more than that.

Q. There are well over 100 of them, are there not?

A. That is probably true. It may be there are as many as 175.

Q. And you added up the reserves and production figures for all of those individual wells and considered them as a whole?

A. Yes.

Q. And they are scattered all over West Virginia, are they not?

A. I Believe they are.

Q. And you could have done that same thing for all of the 772 wells, could you not?

A. No; I did not have the individual reserves computed for each well, unless they were just labeled individual wells.

Q. But if someone furnished you that information you
3111 could have handled all of the 772 in that same way, could you not?

A. I could have; yes.

Q. What is your treatment of marketing lines, and just what are they?

A. That is a figure that was furnished me by the engineering division, and I believe they could answer what they are better than I could.

Q. Do you know what that phrase means?

A. They tell me they are lines used to market gas locally; little sales lines right out in the field.

Q. But apart from what they may have said about it, you do not know what they are or where they are?

A. No.

Q. Or what use they are put to?

A. No. I just have their word for it.

Q. How did you handle that particular classification, Mr. Dunn?

A. That small amount of cost is written off over all gas produced and all reserves from present exi-ting wells as of December 31, 1938.

Q. And that method assumes, does it not, Mr. Dunn, that the company will not develop any additional reserves by additional drilling or purchases after December 31, 1938, in order to put gas through these marketing lines?

A. No; I do not believe it assumes that.

3112 Q. Well, in your calculation, you base it on the probable total recovery of gas for the company's whole system, merely up to its gas development activities as they were made prior to December 31, 1938, have you not?

A. Yes, sir. I might say I would have the choice of either using the December 31, 1938, figure or the total recoverable gas, we will say, from deeper drilling, and on an operated acreage, and all of the other figures, but in the interest of conservative accounting, inasmuch as this gas may never be recovered or it may be deemed not worth while to get it, I wrote it off over the costs known to be incurred and the reserves known to be subject to recovery. It would be stretching your imagination a little bit to include all of the other costs.

Q. Your theory is that just as a matter of conservative accounting the company ought to write off its property rapidly, I take it?

A. If there is any choice between conservative and nonconservative figures, I would certainly pick the conservative figure.

Q. Actually, Mr. Dunn, this depletion reserve for marketing nes and so on, does not purport to measure the exhaustion of the ervice life of those marketing lines, does it?

A. I think it measures it very closely. The chances
3113 are, I am informed by the engineers and geologists, that when all of the gas has gone out of West Virginia, or even ut of the present existing wells, there will be little, if any, use or these local marketing lines. The amount is insignificant. I lo not know what would happen if we used some other method.

Q. And if the engineers are wrong about that, of course you are wrong?

A. Yes; I would change it if I had any better information.

Q. And what you have just said now is all of the gas in West Virginia—you did not use the ratio of Hope's production to all of the gas in West Virginia or even all of the gas that Hope will recover in West Virginia, in working your depletion of these lines, did you?

A. I understand that a ratio does not necessarily have to be higher or lower by using all of the gas in West Virginia. This is a ratio and is not necessarily higher or lower by reason of some change.

Q. Mr. Dunn, you can answer my question. Will you read it, Mr. Reporter?

(Question read.)

A. No; I did not use all of the gas in West Virginia.

Q. Now, your next item is purchasing lines; what are they?

3114 A. They were set up by the bureau of engineering; I did not select them at all.

Q. You do not know what they are?

A. I have been told what they are; do you want me to state that?

Q. Yes.

A. These are little local lines running out to the various purchase gas contract lines.

Q. That is what you understood when you put that phrase down?

A. That is what I was informed.

Q. How did you handle purchasing lines?

A. In exactly the same manner as marketing lines.

Q. You assumed then, did you not, Mr. Dunn, in handling them in that way, that the gas reserves of the company's 340 contract vendors, collectively or individually, were being depleted

in the same ratio that Hope's 1938 gas reserves were being depleted?

A. I was informed by the engineers that that was substantially true.

Q. And who informed you of that, Mr. Dunn?

A. I believe several of the engineering staff informed me.

Q. Will you state their names, please?

A. I am sure I consulted with Mr. French on it.

3115 Q. Mr. French told you that the gas reserves of the company's contract vendors, their over-all gas reserves, were being depleted in the ratio of Hope's production to Hope's 1938 reserves?

A. Not in exact ratio, but there is a relationship there.

Q. But you have used this relationship on Mr. French's statement to you?

A. Yes.

Q. You assumed it was the same?

A. I would assume it would make no material difference because there is only a very little amount of money involved.

Q. You think every time there is a little amount of money involved it does not make much difference whether your figures are accurate or inaccurate?

A. There is always the problem to consider whether an enormous amount of work is justified by the results obtained from it.

Q. That means you used a good many short-cuts here to get your final figures, I assume?

A. It looks like about three short-cuts in this case involving not over $400,000 over a period of many years.

Q. You mean $400,000 in depletion reserves?

3116 A. In plant cost.

Q. Which you deduct in your depletion reserve?

A. Gross.

Q. Now, Mr. Dunn, refer back to your schedule No. 2 on page 25 with which you started.

TRIAL EXAMINER. Off the record.

(Discussion off the record.)

By Mr. MILDE:

Q. You show in your column headed "C," operated acreage.

A. What page?

Q. 25.

A. Yes.

Q. Did you use the same methods we have discussed in connection with field lines and rights-of-way in working out your figures for operated acreage?

A. Yes; the same rates were used.

Q. The same methods?

A. Yes.

Q. You have an adjusted book cost of about $1,600,000 in line 5, and that is the consideration paid for the leases; is it not?

A. Yes; that is the original cost as of December 31, 1938.

Q. That is the dollar or two an acre which was paid
3117 to land owners?

A. In some cases it is considerably more than that.

Q. Is it not also true in working out your figures on operated acreage you also used your pool area method?

A. That is true.

Q. In connection with retirements of leases, you did not charge them by pool areas; did you?

A. No; that is true; I did not.

Q. You handled those just like the retirements we talked about in connection with field lines and rights-of-way?

A. That is true.

Q. And your same general statements as to the reasons and the effect of that method as applied to field lines and rights-of-way costs would apply here; would they not?

A. That is true.

Q. In addition to your adjusted depletion reserves, you develop in this exhibit the depletion allowances for 1937 and 1938, which appear in the income accounts as presented in other exhibits?

A. Yes; they are directly related.

Q. And the amounts of money you have set out in schedule No. 1 on page 23, for example, for 1937 and 1938, are the result of the application of these rates to the cost in each of those years; is that not so?

3118 A. Yes.

Q. And those are the same rates which you used to develop the depletion reserve?

A. Yes, sir.

Q. And all of the assumptions we have talked about in connection with your determination of depletion reserves and other matters apply to your determination of depletion rates; they are one and the same thing, being correlative?

A. That is true. If we lower the reserve, we lower the annual expense, and if we raise the reserve we automatically raise the annual expense.

Q. And these annual depletion rates are all based on this information which was supplied to you in connection with determining depletion reserves, the information supplied you by engineers, and so on; it is the same subject, is it not?

A. Yes.

* * *

3123 Cross-examination by Mr. REEDER:

Q. Mr. Dunn, I believe you testified that in your opinion if you had used the method suggested by Mr. Milde, it would have been generally unfavorable to the company for rate-making purposes: is that right?

* * *

The WITNESS. I do not believe I could state it in the exact dollars and cents, but I do believe that it would have created a higher reserve which would tend to be unfavorable in rate-making
3124 proceedings, leaving less net book cost.

By Mr. REEDER:

Q. It would have resulted in a higher or lower annual allowance for depletion?

A. I believe it would have resulted in a lower annual allowance for depletion.

Mr. REEDER. That is all.

* * *

3621 Cross-examination (continued) by Mr. MILDE:

Q. Mr. Dunn, isn't it a fact that on December 31, 1938, the Company had, according to your figures, 3,262 active gas wells in service?

A. I believe that is the figure. Do you want me to check it exactly?

Q. Yes; if you will.

A. Yes; I have the figure of 3,261, I believe. I got that by adding up the number of wells in which well equipment was capitalized.

Q. 3,261?

A. Yes, sir.

Q. Isn't it a fact that of these wells, there were some drilled each year back from 1938 all the way to 1891?

A. That is correct.

Q. And of the wells drilled prior to 1903, that are now in service, those were wells purchased by the Hope Company after they had been drilled by other parties; isn't that so?

A. Well, I would have to check on that particular point, I don't recall.

Q. Well, you know that the Hope Company first began to drill wells itself in 1903, don't you?

3622 A. No; I never have made any particular study of that, of when.

Q. You didn't determine that that was so in connection with your analysis of original cost data?

A. Oh, yes; it is in the work papers, the date every well was drilled is in there.

Q. And you just don't recollect that now?

A. That is right.

Q. Do you know when the Hope Company first began to abandon wells?

A. That was also included in the work papers.

Q. Can you determine it readily from your working papers?

A. I think so; yes.

Q. Suppose you tell us?

A. Oh, not that readily. It would require maybe several hours.

Q. Well, isn't it a fact, Mr. Dunn, that right from the beginning of the Company's operations to the end of 1922, the Company charged the cost of abandoning wells to operating expenses as the wells were abandoned?

A. Yes; I think that is absolutely a fact.

Q. They were charged to an account called Field Lines and Wells, Account 17, Operating Wells and Field Lines; isn't that so?

A. I would have to check on the exact account; I don't

3623 recall.

Q. Now, isn't it a further fact that under the 1921 West Virginia Public Service Commission Uniform Classification of Accounts, that became applicable to the Company in 1923, the cost of abandoning wells was required to be charged to operating expenses?

A. I believe they have an account in there.

Q. And that in accordance with this Classification, the Company continued to charge well abandoning costs to operating expenses as wells were abandoned?

A. Yes, sir.

Q. And that is true as a direct charge to operating expenses up through 1931; is it not?

A. That is right.

Q. And then in 1932, the Company made a charge in effect to operating expenses directly, did it not, by setting up a reserve each year for the anticipated abandoning costs, and then when the actual costs were known, charging that to the reserve and wiping out this year by year accrual?

A. That is right, the reserve is in effect a charge to operating expenses.

Q. So that, right from the beginning up until 1938, the Company has charged the cost of abandoning wells, as they were abondoned, to operating expenses?

A. Yes, sir.

3624 Q. And that was recognized as good accounting practice in the industry, was it not?

A. Certainly. It might still be recognized as good accounting practice; in other words, if there is no provision in the reserve for cost of removal, cost of removal is an expense.

Q. Now will you turn to your Schedule No. 2 on page 25 of Exhibit No. 61? You recall, do you not, Mr. Dunn, that at the last session we discussed columns (c), (d), and (e) on Schedule No. 2, which were the columns that showed the results of your depletion provisions for Operated Acreage, Field Line Right-of-Way and Construction Cost, and Gas Well Construction?

A. I do.

Q. And we had not reached Column (f), which is entitled "Cost of Abandoning Gas Wells." And there you show, do you not, at the bottom of your column, in line 33, total annual accruals to December 31, 1938, of $2,100,000?

A. That is correct.

Q. Now isn't it a fact, Mr. Dunn, that the details for this determination are shown on your Schedule No. 2D, at pages 32 and 33?

A. That subschedule shows the details of cost of abandoning gas wells by production areas.

Q. And the column (b), as it appears on page 32, is the one that you subsequently transferred to column (f) on

3625 Schedule No. 2 at page 25, isn't that so?

A. Yes, sir; that is correct.

Q. Now referring to page 32, your first line is, or your first group of lines appear under the heading "Cost Subject to Depletion," do they not?

A. Yes, sir.

Q. And here they are shown as blank?

A. That is correct.

Q. And the fact is that you aren't depleting any costs at all in this instance, are you?

A. We are not depleting any invested cost.

Q. You are not depleting any costs, are you?

A. This is strictly a provision for cost of abandoning in the future, and is not incurred today.

Q. That is right, this isn't really a depletion allowance at all, is it?

A. In the terms of depletion being applied to invested capital; no, it is not.

Q. Or applied to any amount of money; you have nothing to deplete here, have you?

A. No; as I explained, it is exactly what it is labeled, the cost of abandoning gas wells in the future.

Q. There is an accrual, or a hypothetical accrual, of a fund to take care of future operating costs or abandoning costs; isn't that so?

3626 A. Well, I believe I just said it was an accrual to take care of the future cost of abandoning gas well, determined as explained under column (a).

Q. Now as you worked that out, Mr. Dunn, you find under line 5 that the expense for the cost of abandoning gas wells, computed for each active gas well at December 31, 1938, at $1,007 per well, will be $3,285,131; isn't that so, as shown in column B?

A. Yes.

Q. And that is your estimate, or the estimate of yourself and Mr. French, of what it will cost the Company to abandon the 3,261 active gas wells that were in existence at December 31, 1938, and which you classified as then in service?

A. That is right.

Q. Now the fact is, is it not, Mr. Dunn, that in the past the Company has not set aside any funds for these future abandonment costs of these existing wells, but has, on the contrary, followed the practice of charging well-abandonment costs to operating expenses as wells were abandoned?

A. That is correct. The first part of your sentence—I might add, there are no funds earmarked for this specific purpose. I won't go so far as to say that they have not set aside funds for this purpose.

Q. You didn't find any set aside on the books, did you, by way of any reserve?

3627 A. No; I didn't find any specific reserve for this particular point; no.

Q. Now this set-up of your's, Mr. Dunn, reflects a shift, does it not, in accounting policy or procedure or requirement?

A. Well, it represents a change, I suppose, in the method of handling cost of abandoning gas wells, certainly.

Q. Heretofore, the cost of abandoning wells has been charged to operating expenses as wells were abandoned?

A. Yes.

Q. And you recognize, do you not, that if that practice is followed consistently, that that produces a fair and equitable result?

A. Yes; it produces a fair result. It may produce a very distorted picture of operating expenses in the future, however; if you start having an abandonment cost of over $3,000,000 that should be charged into operating expenses, it might produce a pretty heavy charge against operating expenses in the future. It should be provided for now.

Q. It hasn't had that effect in the last 40 years, has it, Mr. Dunn?

A. No; there have not been great numbers of gas wells abandoned during the past 40 years.

Q. Why, Mr. Dunn, you know, do you not, that there have been over 2,000, or close to 3,000 gas wells abandoned by the Compahy?

3628 A. Well, over a period of 40 years; yes.

Q. And what you say about some distorted result is just on the assumption that the history in the future will not be the same as the history of the Company in the past?

A. Well, it is based on the fact that these wells will probably be abandoned more frequently in the future than they have been in the past. That is one assumption.

Q. Well, a well is abandoned only once, isn't it, Mr. Dunn?

A. Certainly.

Q. And the fact is, you don't know what the result will be in the future unless you can predict the history of the Company's production system and predict that it will be different in the future than it has been in the past?

A. Well, I think certain future predictions have been made of the Company's future production, and they are in the record, and the geologists estimate the future gas reserves.

Q. Well, all I want to get perfectly clear, Mr. Dunn, is that here the Company, right up until 1938, has been following one system of taking care of this cost, which is to charge well abandoning costs to operating expenses as the wells are actually abandoned. That is true, is it not?

A. Yes; although they probably, at 1932, foresaw the need of some kind of a reserve accounting.

Q. And what you have done here is to set up an accrual
3629 on a different theory, isn't that so?

A. Yes; absolutely.

Q. A completely different theory. Your theory is here that the Company should have accrued a reserve in the past to take care of the abandoning costs of the present existing wells?

A. That is correct.

Q. And it is a sort of a hypothetical accrual, is it not, Mr. Dunn, which you have developed by taking the production of all of the Company's wells in the past, plus the reserves of the existing wells, and you have determined on the ratio of this production to these total reserves, that the Company should have set up a total of $2,107,000, isn't that approximately what you did?

A. Well, when you say "sort of hypothetical," I think this is a very real cost. As I understand the law in West Virginia, you are required to spend about $107,000 as an average cost per well in the future when you abandon that well. I think it is a very real cost and expense.

Mr. Slaff. Did you mean $1,007 in your last answer? You said $107,000.

The Witness. Yes; $1,007.

By Mr. Milde:

Q. Of course this is a very real cost, and we both agree that in the future the Company will have to spend about
3630 $3,285,000 of cash to abandon its present existing wells?

A. I fully expect that they will; yes.

Q. And there isn't any doubt about it that that is coming right out of the Company's pockets, isn't that so?

A. Any estimate in the future might be in some slight doubt, but this seemed to be about as real a figure as we could develop.

Q. It represents real dollars the Company has to spend?

A. I think so.

Q. That isn't what I asked you before, Mr. Dunn. I asked you whether it wasn't a fact that you have got a hypothetical accrual, which assumes that in the past the Company has set aside $2,107,000 towards this future cost?

Mr. SLAFF. That was answered, Mr. Examiner. I object to the question, because it has been answered just previously.

TRIAL EXAMINER. Well, he stated that he didn't consider it a hypothetical matter.

Mr. SLAFF. That is right, he answered it completely.

Mr. MILDE. Well, you don't understand it. May I have the question read again?

(The question was read by the reporter.)

TRIAL EXAMINER. Go ahead and answer the question.

The WITNESS. I don't understand the difference between accrual and hypothetical accrual, but I will answer in terms of ac-
3631 crual in the past, which I will say, as I already said once, that the Company did not provide a specific reserve in the past earmarked for this particular purpose. However, the Company in the past has provided a great deal of reserve which is available for any purpose, and not earmarked for any particular item.

By Mr. MILDE:

Q. This isn't any sort of a depreciation allowance, is it, Mr. Dunn; this is something different; this is merely an accrual for future operating expenses?

A. It operates exactly the same as a depreciation allowance.

Q. And you haven't found anywhere that the Company at any time set aside any funds for the cost of abandoning property in the future?

A. They have a great deal of reserve available for that purpose.

Q. That isn't what I asked you.

Mr. SLAFF. The question has been asked three times and answered three times by the witness.

TRIAL EXAMINER. Yes; I think he has already stated that a couple of times.

By Mr. MILDE:

Q. What have you already stated?

Mr. SLAFF. I object to that. If counsel wants to know what has been stated, he can have the reporter read back the
3632 record to him, and I am willing to have him do that.

TRIAL EXAMINER. He stated that he didn't find any funds earmarked for that purpose.

Mr. MILDE. That is what I understood, and I thought he was trying to modify that answer, and I want it perfectly clear that there was no modification of that.

By Mr. MILDE:

Q. Now, actually, Mr. Dunn, it would have been completely impossible for the Company to have set aside an accrual for these future abandoning costs in the amounts that you have shown here, would it not?

A. By no means would it have been impossible.

Q. Well, in the first place, Mr. Dunn, the Company would have had to know, back in 1898 or thereabouts, that in 1938, or the end of 1938, there was going to be a different accounting system which shifted the theory of handling well abandonment costs, wouldn't it?

A. Well, this isn't particularly a different accounting theory, this is done quite often. I understand that the Company was very familiar with depreciation accounting and depletion accounting back in 1898. There are many letters on file to show that they understood it practically as well then as they do today.

Mr. MILDE. Will you please read the last question, Mr. Reporter?

3633 (The question was read by the reporter.)

By Mr. MILDE:

Q. Now, can you answer that question?

Mr. SLAFF. Let's have the answer read, too.

TRIAL EXAMINER. Read the answer.

(The answer was read by the reporter.)

Mr. SLAFF. It is perfectly answered. He said there is nothing different about it.

TRIAL EXAMINER. You mean that a new system has not been instituted as suggested by the question?

Mr. SLAFF. That is my understanding of the answer, yes; no new principle. What he is saying is that the assumption that counsel is making in his question just doesn't exist as a matter of fact, that is all.

TRIAL EXAMINER. Is that what you mean to say?

The WITNESS. Well, yes; if I understand his question, he assumed that by some action of possibly a regulatory body or some new theory of accounting, that a condition exists today that didn't exist then in accounting, and I say not.

By Mr. MILDE:

Q. Well, Mr. Dunn, the question I started with is this, and I think you agreed with me—if not, you can so state: that as a matter of practice, the Company couldn't possibly have set aside in the past this hypothetical accrual of yours in the total amount of $2,100,000; isn't that so?

3634 A. It couldn't possibly have set it aside?

Q. In the amount that you there show.

Mr. SPRINGER. I object to that. The Company has shown a depreciation accrual that is excessive here, of $40,000,000, on its books to cover all possible losses.

* * *

The WITNESS. Well, I think probably this would happen as a practical matter: if the Company had been setting aside a reserve for abandoning based on production, it would be approximately this amount, maybe not to the dollar.

By Mr. MILDE:

Q. Well, Mr. Dunn, the fact of the matter is that the Company couldn't have set it aside, the Company couldn't have set aside an accrual for abandoning wells that it would have in 1938, and also continue what was then the accepted and required accounting practice of charging well-abandoning costs to operating

3635 expenses as the abandoning costs were incurred; isn't that so?

A. Oh, well, you have presented me with two alternatives, they either do one or the other.

Q. And they followed the alternative of charging well-abandoning costs to operating expenses as they occurred?

A. That is what they actually did: yes.

Q. That is right. And following that alternative, they couldn't possibly, as a practical matter, have also accrue a sum of money to take care of future abandoning costs on the theory that that should be provided for by accruals rather than as a current charge, could they?

Mr. SPRINGER. The question isn't clear. The sum of money refers to what? May we have that read?

(The question was read by the reporter.)

Mr. SPRINGER. Is that sum of money a reserve or a fund that you are talking about?

Mr. MILDE. Are you asking me?

Mr. SPRINGER. Yes, sir; it isn't clear, Mr. Milde.

Mr. MILDE. Well, the question is whether it is clear to the witness.

TRIAL EXAMINER. Do you understand the question?

Mr. SLAFF. We have a right to have it made clear to counsel, too, so that we can know whether to object to the question. It is a perfectly proper inquiry by us as to what is meant by the use of that term.

3636 TRIAL EXAMINER. All right.

Mr. SLAFF. If counsel knows what he means.

TRIAL EXAMINER. Just what do you mean by the use of that phrase, that language?

Mr. MILDE. Well, let me rephrase the question.

By Mr. MILDE:

Q. It is perfectly clear, is it not, Mr. Dunn, that as a matter of practical accounting, starting from the beginning of the Company's operations, that it could not have handled well abandoning costs on two theories at the same time?

A. I think that is perfectly clear; yes, sir.

Q. And having adopted the practice, and being required to adopt the practice, under the subsequent West Virginia Commission Code of Accounts, of charging well abandoning costs to operating expenses as they occurred, they could not, the Company could not, as a practical matter, have also handled them on this accrual theory?

A. Well, you have got a statement in there to the effect that the West Virginia Commission required them to do this. Now I am not sure that if they had applied to the West Virginia Commission and asked for permission to create a reserve, that they wouldn't have given it to them. So I would like not to answer that part as to the requirements of the West Virginia Commission, because I don't know what they would have ordered in that case.

3637 But I will say this, that had they provided a reserve for well abandonment costs, the costs of abandoning should be charged to it; and if they didn't have a reserve, naturally they would charge it to operating expenses.

Q. Now, Mr. Dunn, the question I asked you is this, and I think you can answer it—and this time I will leave out the West Virginia Commission if it will please you any—that following the practice, right from the beginning, of charging well abandoning costs to operating expenses as they occurred, the Company could not, as a matter of practical accounting, have also accrued a reserve for future abandoning costs on the theory that is presented in your exhibit?

A. I don't believe they could have done that exact method. Of course, what would have happened is that they would have arrived at approximately the same result, as I have already testified.

Q. Well, we are perfectly clear, are we not, that they couldn't, as a matter of practical accounting, have done it both ways?

TRIAL EXAMINER. At the same time?

Mr. MILDE. At the same time.

The WITNESS. No; because of the fact that at that time they didn't know exactly what these present existing wells at 1938 were.

By Mr. MILDE:

3638 Q. Well, that is one reason, and the other reason is that you wouldn't possibly handle an operating expense on two different accounting theories which are different, at the same time, would you; that is, you wouldn't follow two theories simultaneously, would you?

A. No, indeed.

Q. And as you pointed out, the Company couldn't possibly have known in its past history, commencing in 1898, that on December 31, 1938, it would have approximately 3,261 wells, could it?

A. No; it wouldn't have known that.

Q. And they wouldn't have known in 1898 that at present price levels it would cost $1,007 to abandon those wells, would they?

A. They might have come to a figure approximating that. I wouldn't say that they couldn't have known that; no.

Q. They couldn't have estimated, back in 1910 or 1911, that the price level by 1938 would be substantially higher, could they?

A. Well, after all, they could very well estimate a cost which might come close to this, and it might even be higher, I don't know.

Q. By the way, do you think that when a company is setting aside reserves, it should include in its consideration the fact that the price levels may change in the future?

3639 A. No; the reserves are for the purpose of writing off the original cost of the property over its useful service life.

Q. Let me ask you one other thing about this $1,007, Mr. Dunn. The fact is that that is cost based on 1939 prices for abandoning, is that not so?

A. I got the cost from the engineering division.

Q. And didn't they advise you that that was based on 1939 prices?

A. No; they did not. I don't recall if they did, they may have.

Q. Now also, Mr. Dunn, it wouldn't have been possible, would it, for the Company to have known, in 1898, for any year right up to 1939, that its production property would be segregated into these pool areas, as testified to by Mr. Ross?

A. Well, had they made a similar study, they might have arrived at the same result.

Q. Well, they couldn't possibly have known that in 1941 Mr. Ross would come along and find certain pool areas in the Company's production property, could they?

A. Well, they probably didn't know that Mr. Ross would do it; no.

Q. Or that anybody would do it?

A. Well, they might have well expected that somebody might investigate their system at some time or another.

Mr. SLAFF. That was a reasonable expectation, you mean?

3640 The WITNESS. Yes, sir.

By Mr. MILDE:

Q. And also you think it is a reasonable expectation that the Company should have had, that this future geologist would divide its production up into these particular pool areas; do you think that that was a reasonable expectation?

A. From what I have learned, or from what I have heard the geologists say in the time I spent in the gas business, it is quite usual to divide production up into pool areas if it is at all possible.

Q. Well, the fact is that you have used these pool areas to arrive at your $2,107,000 accrual figure, haven't you?

A. Oh, yes; I have used them.

Q. And isn't it a fact that these accruals which you make for future cost of abandoning the present wells aren't based on the production and reserves of these particular wells?

A. It is my recollection that they are, but I would have to check to see the figure I used.

Q. I think that is rather important, Mr. Dunn. Will you check it, please?

A. I will have to go upstairs to get my work papers. I didn't bring the depletion work papers down.

Q. We have some copies of your work papers here. Can

3641 you use those?

A. Yes; I believe so.

(After a pause.)

The WITNESS. Will you read the question, please?

(The question was read by the reporter.)

The WITNESS. These wells are included in those production figures; yes.

By Mr. MILDE:

Q. I think you know what my question means, Mr. Dunn. Will you try to answer it more fully? Are they or are they not—and when I refer to "they," I mean these accruals of yours—based upon the production and the reserves of these particular 3,261 wells?

A. You mean—and no other wells—is that what you mean?

Q. That is what I asked you.

A. Yes; I will say, then, that these wells are included in those figures, and also all other production of the Company is included for any well that they had prior to 1938.

Q. That is right. These accruals for the cost of abandoning those 3,261 wells that the Company had on December 31, 1938, are based on the production and the reserves for all the wells the Company ever had, right down to December 31, 1938; isn't that so?

3642 A. That is correct.

Q. And the answer to my question as to whether or not these accruals for the future costs of abandoning these present wells are based on the production and the reserves of only those wells, is that they are not; isn't that so?

A. Well, if you would ask a direct question as to what they are based on, I could answer it directly. But if I answered it any other way, it might leave the impression that they were not included, which they are.

Q. Well, they are included with all the other wells the Company ever had, that is all you are saying?

A. That is right.

Q. And if I ask you again whether or not these accruals are based solely upon the reserves and the production of the particular 3,261 wells for which you develop these future accruals, the answer to that is what?

A. The answer is that they are not based solely on these 3,261 wells, but the word "solely" you did not use before.

Q. Do you know how many wells, Mr. Dunn, are included, or the production of how many wells is included, in the figures which you added to the production and reserves of these existing wells?

A. No; I didn't count them. It was the wells the Company had in the past, whatever wells it produced gas from in

3643 the past entered into this calculation.

Q. It is a matter of thousands, isn't it?

A. Yes.

Q. And it includes wells for which you have not allowed drilling costs in the adjusted book costs of the Company's properties, and the wells for which you have allowed some costs in the adjusted book costs?

Mr. SPRINGER. That is hardly properly phrased. What does he mean by "have not allowed drilling costs"? Is he talking about the costs that were expensed by the company in the past?

TRIAL EXAMINER. I don't know what he means.

Mr. MILDE. Well, Mr. Examiner, I think we have developed here, rather frequently, that in the adjusted book costs the Power Commission's accountants, including Mr. Dunn, have not included any drilling costs in their adjusted book costs for some 2,300 of the Company's existing wells. What I am now asking Mr. Dunn is, when he prepared this hypothetical accrual for these future abandoning costs, if he hasn't considered the production for both wells for which he has allowed drilling costs in the adjusted book costs, and those for which he hasn't.

Mr. SLAFF. Then I object to any question being put to him on the basis of a hypothetical accrual, when Mr. Dunn has testified that it is not a hypothetical accrual.

TRIAL EXAMINER. Well, that word wasn't used in the question, I believe.

3644. Mr. SLAFF. Well, as I understood it, it was explanatory of what was intended by the question.

TRIAL EXAMINER. I think that should be stricken out, if the explanation is to be considered part of the question.

Mr. MILDE. I think there is no question but that it is hypothetical——

TRIAL EXAMINER (interposing). Maybe you might use the term "so-called," or something like that.

By Mr. MILDE:

Q. Let me use the term "computed reserve." I think you will agree that this is purely a computed reserve, will you not, Mr. Dunn?

A. I guess all reserves are computed.

Q. And computed by you here. Now can you answer that question, with the explanation made to the Examiner?

A. I can answer the question, I believe. I can answer it by saying that the total gas produced up to 1938, by years, has been included in this calculation, and that also the gas recover-

able from the wells in service as of December 1938; and it seems to me that you don't completely understand this, and if you want me to explain just what I did, I will be glad to do it at this point.

Q. Well, I am sorry, you didn't quite answer my question, Mr. Dunn. Will you tell me now whether or not, in the past
3645 production which you have used to develop this computed total annual accrual of yours, you have not used production from wells for which you have allowed drilling costs in the adjusted book costs, as well as for wells for which you have not allowed drilling costs?

* * *

The WITNESS. When I answered by saying total production, I meant both types of wells.

3646 By Mr. MILDE:

Q. And by "both types" now you mean wells for which you have included drilling costs in your adjusted book costs, and wells for which you have excluded drilling costs, do you not?

A. That is correct.

Q. Now, Mr. Dunn, going back again to page 32 of your detailed schedule, column (b), let me ask you if your figures don't contemplate that of the $3,285,000 of cash which the Company must have to abandon the wells existing as of December 31, 1938, your method provides for the recovery of only $1,177,000, in round numbers, in the future?

A. Well, I am inclined to answer that yes; if I understand your question perfectly.

Q. Well, I think you do, Mr. Dunn; and it is perfectly clear, is it not, that all you have to do is to find out what this total cost is, which is $3,285,000, which will be incurred in the future, and you deduct from that $2,107,000, which you have set up in your lines 33 and 35; and that means that after 1938, by your method, the Company will recover the difference between $2,100,000 and $3,285,000, or $1,177,000?

A. On these particular wells.

Q. That is what we are talking about, these particular wells. And the fact of the matter is that your computation
3647 provides that when the Company actually spends this $3,285,000 in the future, as these existing wells are abandoned, it will draw down on the $1,177,000 which you are going to allow it in operating expenses in the future, and for the bal-

ance of the cost of $2,100,000, it has just got to take that out of its own pocket, hasn't it?

Mr. SPRINGER. Wouldn't it be more accurate to say that the rate payer would pay the operating expenses?

Mr. MILDE. No; I am sorry, Mr. Springer, but a rate payer pays for gas, not for operating expenses.

Mr. SPRINGER. It must include operating expenses.

By Mr. MILDE:

Q. Well, isn't it perfectly clear, Mr. Dunn, that under your method you are going to provide, starting in 1939, in operating expenses, by your accruals here, $1,177,000 to take care of these future abandoning costs, and that is all, from 1939 on; isn't that so?

A. Well, I would say that we start from 1913 to make provision for the total, and I don't see what particular significance 1939 has. If we are considering operating expenses in 1938, then we provide $56,000 in that year; if we consider operating expenses in 1937, we have provided $75,000 in that year, plus whatever cost of abandoning has been charged to expenses.

Now if those years have no significance, we will start
3648 with 1939.

Q. Well, Mr. Dunn, isn't it a fact that the only money the Company will get for this future $3,285,000—that is, get in fact—is the amount you allow, or the Commission allows, in operating expenses by way of accrual for this future cost, starting in 1939 when this new system of accounts went into effect?

A. The amount that they will get in operating expenses will be largely determined by the years in which they consider operating expenses. If they do not consider the years 1937 and 1938 in operating expenses, your statement is correct, that is all they will get.

Q. So in fact, the Company is going to be allowed to recover only $1,177,000, and the $2,100,000 which you have assumed has been accrued in the past, will have to be provided out of what funds or property it now has on hand, won't it?

A. I would say no.

Q. Well, where is it going to get the $2,100,000?

A. If in fact the Commission allows 1937 and 1938 operating expenses in their estimate or allowance for operating costs, and considers them, then they will, in fact, get $75,000 for this accrual in 1937, and another $73,000 for cost of abandonment, which has been included in operating expenses in 1937; and the

same thing will be true for 1938, except that the amounts
3649 are slightly larger in the case of cost of abandonment, which is $82,000, and the other figure is $56,000.

Q. That brings your figure down to a little bit below $2,000,000. Where will it get the $2,000,000?

Mr. SLAFF. Do you understand that question?

The WITNESS. I certainly don't understand that last question.

By Mr. MILDE:

Q. As I understand it, what you have done is to refer to page 32, lines 32 and 31, and said that if the Commission took 1937 and 1938 operating expenses into account, the Company would get $75,800 in 1937, and $56,169 in 1938, on your method, plus some amounts which you mentioned for the actual cost of abandonment that was incurred by the Company in those years, following its old practice?

A. That is right.

Q. And in that connection, Mr. Dunn, of course these additional amounts you mentioned, which you say the Commission will allow, was not for the cost of abandoning any of these present wells, was it?

A. Nevertheless, it is a cost, and a cost of abandoning gas wells, and that is what this problem is devoted to. I don't know what your distinction is there. It is a cost of abandoning gas wells actually incurred, and you have brought out very clearly the fact that this has been charged to expense, and we must consider
3650 the fact that it is charged to expense.

Q. Well, Mr. Dunn, we are taalking now about the cost of abandoning the 3,261 wells which were in service on December 31, 1938, are we not?

A. Yes; we are talking about——

Q. (Interposing.) That is what this whole accrual of yours is for isn't it?

A. That is correct.

Q. And you have pointed out that in 1937 and 1938, if the Commission follows your method, the Company is going to get $75,000 and $56,000 in operating expenses towards the cost of abandoning the wells in existence at the end of 1938?

A. That is right.

Q. And that is all that it is going to have towards that cost, is it not, in those years?

A. It is also going to have another feature which, if we had not included it in operating expenses, would have been included

here. Therefore, they will get more. That is directly related to this problem, and I tried to explain that a while ago, that you didn't seem to understand, but you apparently did not want to hear my explanation.

Q. I am afraid I understand it too well, Mr. Dunn. Let me ask you if it isn't a fact that excluding the $75,000 and the $56,000, which you show in your lines 31 and 32, which make $130,-
3651 000, roughly, that the Company must just dig into its own pocket, out of its cash resources, or borrow from somebody if it doesn't have the cash resources, to pay the $1,900,000 of future abandoning costs?

A. I believe what they will actually have to pay in the future will be determined solely by what the Commission allows in operating expenses. If they allow the method that I have set up here, there will be an allowance in operating expenses of $75,000 a year in 1937, plus the amount they actually spent that year to abandon wells——

Q. (Interposing.) That is for wells in the past, isn't it?

Mr. SLAFF. Have you concluded your answer?

The WITNESS. No.

Mr. SLAFF. Please finish it.

The WITNESS (continuing). As to just what they would have to dig into their pockets for, would be rather a complicated calculation that I just can't make right here.

By Mr. MILDE:

Q. Mr. Dunn, it is perfectly apparent from what we have developed, is it not, that on your method of accruing for future well abandoning costs, all that you provide towards that future cost of $3,285,000 is whatever the accruals are from 1939 on, as I suggested to you, or from 1937 on, as you suggested?

A. Yes.

3652 Q. And that at the most, that would make, say, $1,300,000, or thereabouts, of future accruals towards this total future cost of $3,285,000; isn't that right?

A. Yes; I believe that is correct.

Q. And all I am suggesting to you is that the balance of the $2,000,000, or approximately $2,000,000, the Company just has to provide for out of some other source, does it not, than these accruals from 1937 or 1939 on?

A. Or has possibly provided for in the past.

Q. And the net effect of what you are doing—let me ask you this: Wouldn't you think it fair, if you are going to shift over to a new system of accounts, new system of accounting on well abandoning costs, whereby you are going to set up an accrual rather than charge your well abandoning costs currently as wells are abandoned, to say, "All right, we will set up this new system now, but in fairness we have got to let the Company set up that accrual over the remaining life of these existing wells"?

Don't you think that would be a fair way to do it?

A. I am afraid that would be a violation of accounting principles, and not fair.

Q. You don't think that would be a fair way to do it?

A. Not considering this case; no.

Q. Do you think it would be a matter of proper accounting principles to let the Company continue to charge well
3653 abandoning costs to operating expenses as the wells were abandoned?

A. That would not violate any accounting principle. It would not be conservative accounting, though, I don't believe.

Q. So that it would be perfectly proper accounting practice to continue to charge well abandoning costs to operating expenses as they occur, wouldn't it?

A. I wouldn't say "perfectly proper." I think the Company realized the need of providing a reserve when they started one themselves in 1932. So it is proper, but I would say not eminently proper.

Q. Well, everybody considered it so, did they not, for 20 or 30 years?

A. That is right, they considered it proper accounting.

Q. All right.

Now if that happened, Mr. Dunn, the fact of the matter would be that as these wells were abandoned in the future, 10, 15, or 20 years hence, whatever it might be, some each year, the Company would be reimbursed their $3,285,000?

A. That is right.

Q. Now——

A. (Interposing.) Wait a minute. I will have to qualify that as to what they will actually be reimbursed. This, of course, could present an extraordinary loss of $3,000,000 here,
3654 and whether or not the rates will be high enough to cover it, or could possibly be high enough to cover it, I don't know. So I can't say they would actually be reimbursed on it.

Q. On this method of accounting they would be reimbursed, would they not?

A. If the rates were high enough to cover any loss, no matter in what year incurred, they would be reimbursed.

Q. Of course, if rates are not high enough, Mr. Dunn, they just aren't high enough to cover expenses—that is all you are saying?

A. That is right; so I can't guarantee that they will be.

Q. Well, now——.

TRIAL EXAMINER (interposing). You have to assume they will be?

The WITNESS. Yes.

By Mr. MILDE:

Q. Now if we followed that method of accounting, the Company would get back its $3,285,000. Now if we say, "Well, we don't like this method of charging well abandoning costs to operating expenses as wells are abandoned; we ought to begin to accrue a reserve"—isn't it a fact that the only way that the Company can be reimbursed this total of $3,285,000 is to accrue that reserve over the remaining production of these existing wells?

3655 A. By no means.

Q. You don't think that that is a fact?

A. I know it is not a fact.

Q. And isn't it a fact that what you have done is to provide for accruals, either from 1937 or 1939 on, towards this actual cost of $3,285,000, of $1,200,000 or $1,300,000, such as we have developed before—that is all you have provided towards that actual future cost, isn't that so?

A. Well, by looking at this total in column (b), page 32, you will see exactly what is provided here.

Q. Well, I think you can answer that question, Mr. Dunn, directly.

A. Well, I will answer it this way, that I have earmarked certain expenses in my calculations as being provisions for this cost. Now they are not earmarked as such on the Company's books. However, should the Company desire or find it necessary to set up this reserve, there is certainly a balance available on the books to transfer to this amount, and many millions of dollars left over. So in fact, the amount has been provided for.

* * *

3656. Well, let me ask you again, Mr. Dunn: What you are assuming is, is it not, that approximately $2,000,000 of these future abandoning costs which the Company has to

3657 pay out in cash, will be, in effect, supplied by using up a part of the reserves which the Company has set up on its books in the past?

A. Yes; that is correct.

Q. And it is perfectly clear, is it not, Mr. Dunn, that in the Company's past reserves, there has at no time been any provision made by the Company specifically for the future abandoning costs of future wells?

A. That is correct.

Q. Referring again to page 32, Mr. Dunn, let me ask you if these figures in your totals, under column (b), don't really constitute a reaccounting all the way back over the Company's history, for the abandonment reserve for existing wells?

A. I don't know whether you would call it "reaccounting" or not. It is a revised depreciation reserve all the way through, of which this is one small part, maybe a substantial part, and it is due to the fact that the Company now has an excess amount of accrued depreciation.

Q. Well, this is just reaccounting backwards over the history of the Company from December 31, 1938, back to 1898, for a reserve for abandoning costs of present wells, which reserve the Company never had?

Mr. Springer. I object. He has already said it wasn't a "reaccounting."

Trial Examiner. Yes, he certainly has. I don't see any reason why he shouldn't say "no" again, though.

3658 Mr. Milde. He didn't say that, he said he didn't know whether he would call it exactly that.

By Mr. Milde:

Q. But in substance it is a reaccounting, isn't it, Mr. Dunn?

A. I would call it a revised reserve for depreciation, of which this is one part, made necessary by the fact that the Company's book reserve could not be used in this case.

Q. Well, let me ask you this, Mr. Dunn: Isn't it a fact that you have set up these figures on page 32 on the assumption that this Commission's Uniform System of Accounts has been in effect for these present wells since the beginning?

A. No; not on that assumption, particularly.

Q. Well, generally, you have assumed that under the present System of Accounts a reserve for future abandoning costs should have been set up, and you have proceeded to set it up for these 3,261 wells, haven't you?

Mr. SLAFF. I object to that. There are two questions there. You have assumed something and you have done something—those are the two questions. I object to the two questions in one.

TRIAL EXAMINER. Read the question.

(The question was read by the reporter.)

TRIAL EXAMINER. Have you assumed that it should be set up?

3659 The WITNESS. I didn't assume that under the present System of Accounts, because I don't think there is a word in the present System of Accounts that even mentions such a problem as this. It is just ordinary accounting practice which the System of Accounts also follows.

By Mr. MILDE:

Q. Well, that last answer of yours is rather interesting, Mr. Dunn.

If there is nothing in the Commission's present Code of Accounts on well abandoning costs, why didn't you just carry out the past practice of the Company, permitting it to charge well abandoning costs to operating expenses as they occurred?

A. Well, I felt that an amount like that of $3,000,000, a known cost to be incurred in the future, should be provided for by this Commission, and it is eminently proper that they should recognize that and provide for it.

Q. Of course, that $3,285,000 would have been provided for by currently charging well abandoning costs as wells were abandoned, wouldn't it?

A. In such a cost as that, it is well to provide a reserve for it. That is what a reserve is for, to take care of such extraordinarily large expenses in future operating costs.

Q. And it is a fact that if the Company's past accounting practice had been carried out, then over the future years, as these existing wells were abandoned, the Company would be

3660 allowed to charge in operating expenses this $3,285,000 as the wells were abandoned; isn't that a fact?

A. That is correct.

Q. And isn't it a further fact that by this shifting theory of yours, which you——

Mr. SLAFF (interposing). I object to that right now, because it is obviously an improper characterization, and there is no point in going on with the rest of the question.

By Mr. MILDE:

Q. Isn't it a further fact, Mr. Dunn, that by this method which you have used—and I understand that you say it is not required by the present Code of Accounts, is that right?

A. I don't think it is specifically required. There is an implication in the Code of Accounts that costs of abandoning should be charged to a reserve, but of course there must be a reserve provided for in order to charge it to that.

Q. Isn't it a further fact, then, that by this method which you have used here, you have and you will permit the Company to charge from either 1937 or 1939, whichever you select, only $1,300,000 in current operating expenses towards this future actual cost of $3,285,000?

A. That is right, that is all that can be charged in addition to the amount already provided.

Q. And if there had been no change in the past practice
3661 which the Company has followed for 40 years, it would have recovered, in current operating expenses, not $1,300,000 as you provide, but this actual $3,285,000 cost?

A. That is correct.

TRIAL EXAMINER. We will take a recess of 10 minutes.

(Whereupon, a 10-minute recess was taken, after which the hearing was resumed.)

TRIAL EXAMINER. You may proceed, Mr. Milde.

By Mr. MILDE:

Mr. Dunn, these total figures on page 32, you carry over to column (f) on Schedule No. 2 at page 25, do you not?

A. Yes, sir.

Q. And you show there, in lines 33 and 39, under column (f), this figure of $2,107,000 of computed accruals that we have been talking about, do you not?

A. Yes, sir.

Q. Now isn't it a fact that that $2,100,000, you add in line 39 to your reserves for Operated Acreage, Field Line Right-of-Way and Construction Cost, and Gas Well Construction, to give you a total figure of $6,612,000?

A. I do.

Q. And referring to column (b), line 40, you show an adjusted original book cost, as you phrase it, of $9,956,000, do you not?

A. Yes.

3662 Q. And that is composed of your adjusted book cost of Operated Acreage, as shown in column (c); and Field

Line Right-of-Way and Construction Cost, in column (d); and your Gas Well Construction Cost, in column (e); is it not?

A. That is right.

Q. Now, then, you deduct from that $9,956,000 this figure of $6,612,000, as shown in line 41, isn't that so?

A. Yes, sir.

Q. Which includes this $2,100,000 of computed accruals for future well abandoning costs?

A. That is correct.

Q. And you deduct that and get a net book cost of $3,343,000?

A. Yes, sir.

Q. And isn't it a fact that the effect of that deduction is to reduce, by $2,100,000, your net book cost of Operated Acreage, Field Line Right-of-Way and Construction Cost, and Gas Well Construction?

A. That is true; it does reduce that.

Q. And if you hadn't worked this computed accrual for future well abandonment costs, into your reserves for Operated Acreage, Field Line Right-of-Way and Construction Cost, and Gas Well Construction, you would have shown a net book cost for those properties of about $5,451,000, wouldn't you?

A. Yes, sir.

3663 Q. So really the effect of your computed accrual is to eliminate $2,100,000 of the net book cost of Operated Acreage, Field Line Right-of-Way and Construction Cost, and Gas Well Construction Cost?

A. That is correct.

* * *

Q. Will you turn to Schedule No. 3 at page 34? This is your summary schedule for production plant, is it not?

A. It is the depreciable property in the production plant.

Q. Whereas, your Schedule 2, which we last referred to, was the depletable property in the production plant?

A. Yes, sir.

Q. I notice that the second line of this Schedule No. 3, Mr. Dunn, says "Annual and Accrued Depreciation." Isn't

3664 that so?

A. Yes, sir.

Q. Which figure on this Schedule No. 3 represents accrued depreciation in the production plant?

A. The amount shown on line 53.

Q. Line 53, which reads "Total Reserves for Depreciation of Production Plant as Adjusted, December 31, 1938"?

A. That is correct.

Q. And that figure is $8,673,000, in round figures?

A. Yes, sir.

Q. And doesn't that same figure appear at line 55, called "Adjusted Depreciation Reserves"?

A. It does.

Q. And immediately above is the figure of $16,352,000, called "Adjusted Original Book Cost"?

A. Yes.

Q. Now you say that $8,600,000 is accrued depreciation. What is the percent of accrued depreciation, as you determined it on this Schedule No. 3, for the total production plant—depreciable property?

A. Roughly, slightly over 50 percent.

Q. Well, isn't it 53 percent, Mr. Dunn?

A. I don't have the figure before me. I suppose it would be about 53 percent.

And that leaves a net book cost of production plant
3665 of about 47 percent, does it not?

A. Yes, sir.

Q. As derived from the figures in column (b)?

A. Yes.

* * *

3668 Q. Mr. Dunn, will you tell me what you mean—and not what Mr. Smith means—by the term "accrued depreciation" as used in the heading of Schedule No. 3 and in the headings of your other Schedules throughout this exhibit?

A. That represents the actual existing depreciation in the property, and it is determined by spreading the service value over the service life, in this case original cost.

Q. Now will you tell me what you mean by the term "actual existing depreciation?"

Mr. SPRINGER. Well, Mr. Examiner, that is pretty obvious, isn't it?

3669 TRIAL EXAMINER. If it is, I don't see any reason why he shouldn't state it.

The WITNESS. It is the amount of the cost of the property that has been consumed in gas service.

3670 By Mr. MILDE:

Q. You don't consume a cost in gas service, do you, Mr. Dunn; you consume property?

Mr. SLAFF. I object to that. Again he has got two questions in one.

TRIAL EXAMINER. All right, separate the questions, please.

Mr. MILDE. Will you read that last answer?

(The answer was read by the reporter.)

By Mr. MILDE:

Q. What I am now asking you, Mr. Dunn, is whether it is cost or property that is consumed in gas service?

A. Well, undoubtedly both.

Q. Well, as I understood it, you were defining "actual existing depreciation" in property; is that right?

A. I have identified this as being cost dollars.

Q. Then, when you defined accrued depreciation as the actual existing depreciation in the property, you didn't quite mean that, did you?

A. Well, if the word "depreciation" is understood to mean depreciation in dollars, that is exactly what I meant.

Q. Well, wouldn't it be more accurate to say that what you mean is actual existing depreciation in the cost of the property?

A. I am not exactly sure as to just what that would
3671 mean. If it means the same as I defined it, then it is right.

Q. Well, you are not really dealing with property here at all, are you; you are dealing with costs as you have adjusted them?

A. The cost is, of course, directly related to certain property.

Q. And I want to know whether, when you say "accrued depreciation" as you do throughout this exhibit, you mean accrued depreciation as existing in the company's properties, or whether you are talking about accrued depreciation existing in the book cost or some other cost?

Mr. SLAFF. I object to that. He has answered it several times.

TRIAL EXAMINER. Go ahead and answer it again.

The WITNESS. I mean in terms of the original cost of the property.

By Mr. MILDE:

Q. So this phraseology "accrued depreciation" or "actual existing depreciation" is related solely to the cost of the properties as you have determined them; is that so?

Mr. SPRINGER. I object, Mr. Examiner. Mr. Smith has been the witness on the principles of depreciation, and he has defined very definitely what "actual existing depreciation" is. He says: "Actual existing depreciation is the expired, diminished,

or consumed service life, which I also term the economic
3672 life of a utility's depreciable plant." He has stated that
at page 2831 of the transcript. Mr. Smith designed this exhibit and supervised Mr. Dunn, and I think the question should be presented to Mr. Smith, although it is very plain from the transcript already what the term means.

Mr. SLAFF. I might add, Mr. Examiner, in line with Mr. Springer's statement, that we have Mr. Smith here and he has been here all the time and is ready to be produced on cross-examination of his direct testimony on the subject of depreciation at any time that the company indicates that it desires to examine him on cross-examination on the subject of depreciation.

Mr. MILDE. Read the last question, please.

(The question was read by the reporter.)

Mr. MILDE. I think I am entitled to an answer to that question, Mr. Examiner.

TRIAL EXAMINER. I don't understand just exactly what the fact that Mr. Smith has defined certain terms here, and the fact that Mr. Smith is available for cross-examination has to do with the use of those definitions and the application of those definitions in the preparation of this exhibit.

Now, I assume that this witness necessarily applied those principles, and the purpose of the question, it seems to me, is to determine just exactly how he construed them, and how he applied
them in this case. It seems to me to be perfectly proper
3673 cross-examination, and the objection is overruled.

The WITNESS. The reserve does apply to the original cost of the property. I wouldn't want to say "solely," because depreciation reserve is a very broad term, and I don't know for what purpose the word "solely" was inserted.

By Mr. MILDE:

Q. I wasn't asking you about your reserve, I was asking you about the term "accrued depreciation," or "actual existing depreciation," as you subsequently stated it.

A. And that also is synonymous with the reserve for depreciation, as shown on line 53.

Q. Then we are perfectly clear that that relates to the cost; is that right?

A. That is right.

Q. And we are not talking about accrued depreciation or actual existing depreciation in the sense that an engineer would deter-

mine that, or in the sense that an engineer might find that in the physical properties?

Mr. Reeder. I object to that.

Mr. Springer. I object to what an engineer might do.

Trial Examiner. Objection sustained.

By Mr. Milde:

Q. Let me ask you, Mr. Dunn, if it isn't a fact that this accrued depreciation, this actual existing depreciation, and this depreciation reserve of yours—which you say are synonymous;

3674 isn't that right?

A. That is right.

Q. (Continuing.) Is merely the sum of annual accruals that you have computed as applying to the adjusted book costs of the properties less retirement losses charged against this reserve, that you charged against the reserve?

A. That is absolutely correct.

Q. Now, referring you again to schedule No. 3, page 34——

A. (Interposing.) Wait a minute. There is liable to be a misunderstanding there. There are a few other items set forth on this exhibit, composing the accrued depreciation, which you will notice are reserves acquired from other companies. That also enters into the determination of the total, outside of the specific provisions set forth here.

Q. Well, we will come to that a little later, but let me just clarify your answer, if I may, Mr. Dunn. What you mean is that in addition to these accruals that you have worked out, you have added reserves acquired from other companies; that is what you are saying now, isn't it?

A. Yes, sir.

Q. So that we add some company bookkeeping figures to your exhibit figures, or you added the company's bookkeeping figures to your exhibit figures on these reserves?

A. Some company cost figures, which are also bookkeeping figures.

3675 Q. Company inherited reserves, isn't that what you are saying now?

A. I said acquired reserves.

Q. Now, referring again to schedule No. 3, on page 34, your first item there is "structures," is it not, column (c)?

A. Yes.

Q. And that has an adjust book cost of $212,000, as you show it in line 5; isn't that so?

A. Yes, sir.

Q. Now, that is a relatively small portion of the depreciable part of the production plant; is it not?

A. Yes, sir; that is.

Q. And for that reason I would like to turn to column (d), which is Field Line Material, Measuring and Regulating Station Equipment, where you show an adjusted book cost of $7,934,000; isn't that so?

A. Yes, sir.

Q. And that is almost half of your total for this property shown in column (b); is it not?

A. Yes.

Q. Now, under your line 5 there appear the figures 2.22 percent for this Field Line Material, column (d), and similar figures of 4.17 percent, 2.50 percent appear under columns (c) and (e); do they not?

A. Yes.

3676 Q. Now, those are the annual depreciation rates supplied to you by Mr. French, are they not?

A. That is correct.

Q. You made no investigation yourself as to the reasonableness or unreasonableness of those depreciation rates?

A. I did not.

Q. And if any of those rates should be in error as a matter of mathematical judgment, your computations, using those rates, would carry through those same errors, would they not?

A. They would reflect an error to that extent; yes, sir.

Q. Now, I would like to develop with you, Mr. Dunn, your general method as to what you did with Mr. French's rates, and using column (d) as an illustration, the column (d) relating to Field Line Material, isn't it a fact that you have applied Mr. French's 2.22 percent rate to the average book balances in the company's field line material account, from 1898 down to 1938?

A. That is correct.

Q. And those are simply the average plant balances as they were set up by the company; isn't that so?

A. They weren't exactly set up this way. We made a reclassification or redistribution of certain accounts in order to group them. That is, the company didn't use the same account all the way through, and sometimes they overlapped.

3677 Q. What you mean, Mr. Dunn, is that you simply regrouped the figures as appearing on the company's books

for gross plant balances, into these categories of Structures and Field Line Material, and so on?

A. They have been so grouped.

Q. But they are the company's book figures?

A. Yes, sir.

Q. And you haven't made any adjustments retroactively to those book figures from 1938 back to 1898, have you?

A. Not on this account.

Q. Well, you haven't on any accounts, have you, except to eliminate the plant balances for the property used to transport coke-oven gas?

A. I recall one other adjustment——

Q. (Interposing.) Well, did you make that one?

A. Yes, we made that one; and then we included $1,400,000 in the year 1920, which the company for some reason wrote off to expense, but which we felt should not have been written off. So we naturally included that in a retroactive manner.

Q. And did you put that in retroactively as of the year in which you restored that to plant account?

A. Yes; rather than trying to divide these costs up into five years, of which only some portion remained, we took 1920 as the average year.

Q. But, apart from those two adjustments, you have
3678 simply taken the company's plant balances, per books, and applied Mr. French's rates each year to the average plant balance for that year?

A. That is correct; that is the only adjustments that I recall.

Q. And isn't that what these figures are in lines 6 to 46 under column (d)?

Mr. SPRINGER. Mr. Milde, does that previous question refer to the restoring of the annual allowances which appear on page 34 in lines 6 to 46?

Mr. MILDE. That is true; the accruals.

The WITNESS. Yes.

By Mr. MILDE:

Q. In other words, Mr. Dunn, that $28.26 that appears in line 6 under column (d) for the year 1898 is 2.22 percent of the company's average plant balance for 1898 for field line material?

A. Correct.

Q. And so on down through each year?

A. Yes.

Q. And in the year 1938, as shown on line 46, for example, the $180,000, speaking in round figures, is 2.22 percent of the gross plant balance as shown on the company's books for the year 1938, averaged as between the beginning and the end of the year?

3679 A. That is correct.

Mr. SLAFF. Can I have that question back again, please?

(The question was read by the reporter.)

Mr. SLAFF. I am not clear as to whether that is the balance on the company's books or the balance on the company's books as adjusted by Mr. Dunn, and the application of the percentage made to that.

The WITNESS. That is the amount as adjusted for the 1938 balance.

By Mr. MILDE:

Q. You say that for the year 1938 it is the amount as adjusted by you, Mr. Dunn?

A. It is not; it is the average for the year, and the adjustment is only effective as of December 31, and I did not make it retroactive in any manner.

Q. Well, in order to clarify Mr. Slaff on this, Mr. Dunn, you have not reflected back to the year when they occurred, the adjustments which you made as of December 31, 1938, in connection with your determination of adjusted book costs, have you?

A. Outside of the items noted, there has been no adjustment made back.

Q. Outside of the coke-oven gas property, and that $1,400,000 to which you previously referred?

A. That is right.

3680 Q. And your 2.22 percent rate in 1938, 1937, 1936, and so on, has been applied to what the company's books show or showed as of those years for gross plant cost of field line material, and so on?

A. Correct.

Q. You have assumed in this calculation, have you not, that the company's properties—and when I talk of "properties" in connection with this examination here, I am referring to the properties that are comprised in the accounts we are looking it. You have assumed, have you not, that in 1898 the company's field line properties, as then existing, were depreciating at the annual rate of 2.22 percent?

A. That is correct.

Q. And in 1899 at 2.22 percent?

A. Yes.

Q. And so on down through the years, right down to 1938?

A. Yes, sir.

Q. And isn't the general method of approach that you have used here, to set up a reserve that the company would have accumulated if it had started in 1898 and had applied Mr. French's rates as he has now determined them, to the plant balances?

A. Yes; I believe that is the result.

3681 Q. Let me ask you if this first set of figures in lines 6 to 46 don't represent merely the accruals on that theory?

A. That is correct; those are the provisions; annual provisions.

Q. That is, that is what the company would have accrued if it had done what we have just talked about?

A. Yes, sir.

Q. And against that of course you have to, on your theory, make certain retirements and deductions and so on?

A. Yes, sir.

Q. Now I notice that your total accruals for field lines, which we are talking about here, field line material, at the end of 1939 amounted to $3,864,000, as shown in line 47; isn't that so?

A. Yes, sir.

Q. Now you next have an item in line 48, "Add—Reserves Acquired"—$780,416?

A. Yes, sir.

Q. Now is that figure the reserves which appeared on the books of the predecessor utilities and nonutilities for property which the Hope Company purchased?

A. Not in every instance.

Q. Well, generally what is it?

A. Well, in the case of the Clarksburg Light & Heat, it is a reserve. In some of the other companies it may be a

3682 reserve that appeared on their books. In other instances, the company set up this reserve as if recorded the property, at the time it recorded the property on its own books, because they didn't have the other companies' books.

Q. Well, from which predecessor companies or predecessor utilities or nonutilities did most of these reserves acquired come from?

A. A very large amount came from the Mountain State Power Company.

Q. The Mountain State Gas Company, isn't it?

A. Yes.

TRIAL EXAMINER. When you say "It came from" there, do you mean it was actually on the books of the predecessor company, and then entered on the books of the company?

The WITNESS. I would have to check another work paper I have—analysis of acquisition. This merely is a break-down of the reserves acquired, and it doesn't show exactly whether or not it was entered on the predecessor company's books.

TRIAL EXAMINER. The records there simply show that the amount was set up on the books of the Hope Company when the property was acquired?

The WITNESS. Yes, sir.

By Mr. MILDE:

Q. You were saying that a large part of these reserves acquired came from the Mountain State Gas Company?

3683 A. Purchase.

Q. And another large part came, did it not, from the Clarksburg Light & Heat Company?

A. Yes; also a large part came from the Carter Oil Company.

Q. That was in the early days?

A. 1926.

Q. Well now, responding more directly to the Examiner's question, Mr. Dunn, isn't the situation generally that on these large purchases the Hope Company put on its books whatever the predecessor companies had on their books, and then put in its depreciation reserve whatever reserve the predecessor companies had set up; isn't that generally the situation?

A. Yes. I have a general discussion of that situation on page 4 of my direct testimony.

Q. And that is the reason that you called this line 48, as shown on this schedule, and similar lines on your other schedules, as "Reserves Acquired"; isn't that so?

A. That is not the sole reason, of course. The important point there is that these must be stated on the basis of the actual cost to the Hope Natural Gas Company, and the difference between reserves and original cost and purchase price must be correctly accounted for—and this is one step in that accounting.

Q. Well, what you have ultimately reflected in your Plant Accounts, as you adjusted them to determine the adjusted

3684 book cost as of December 31, 1938, is the purchase price to

Hope of the Mountain State Gas Company property and the Clarksburg property; isn't that so?

A. Well, I just said that it is reflected in the plant accounts, and the reserve accounts. They both must be taken into consideration when you consider purchase price.

Q. Was your treatment the same, Mr. Dunn, for properties purchased from nonutilities?

A. I might explain that by saying that Hope's treatment was approximately the same. Their practice at all times was to record original cost as nearly as could be determined. The difference between original cost and purchase price, if any, was recorded in the reserve for depreciation.

Q. Mr. Dunn, I don't want to quarrel with you about the practice of the company, but are you attempting to testify now that in connection with its bookkeeping over the years, the Hope Company ever attempted to find out the actual original cost of properties which it purchased?

A. Oh, I certainly am. That is very clearly indicated by the fact that they have got these books from the other companies, have made investigations of them, went out and took field inventories. I think they determined it in every instance that I have been able to check.

* * *

3687 Q. Now Mr. Dunn, in connection with these reserves that were acquired by the Hope Company from the Clarksburg Light & Heat Company, and the Mountain State Gas Company, and the Carter Oil Company, were or were not those reserves set up by these predecessor companies at an annual rate of 2.22 percent as applied to Field Line Material?

A. I doubt that they would be, I don't know of course in every instance.

Q. Did you make any investigation as to the annual rate at which these predecessor companies set up their depreciation reserves?

A. I have already testified that I did not. You asked me that very same question once before.

3688 Q. On another exhibit.

A. No; on this exhibit.

Q. You know, do you not, Mr. Dunn, that the Clarksburg Light & Heat Company, and the Mountain State Gas Company were affiliated companies of the Hope Company at the time of purchase?

A. I believe that they were, I don't recall exactly the extent of the affiliation.

Q. And wouldn't you expect that their annual depreciation provisions would be on a very conservative accounting basis, just as in the case of the Hope Company?

Mr. REEDER. I object to the form of the question. It seems to me this Commission is not interested in any speculations, and I don't think it is proper for counsel to ask the witness to speculate.

TRIAL EXAMINER. Read the question, please.

(The question was read.)

TRIAL EXAMINER. It seems to me that you have two questions.

Mr. MILDE. I will withdraw it, Mr. Examiner, because of course actually Mr. Dunn ought to know this.

By Mr. MILDE:

Q. Isn't it a fact, Mr. Dunn, that the books of the Clarksburg Light & Heat Company were available to you?

A. Yes.

Q. And that if you had examined the depreciation vouchers
3689 of that company, you could have determined the precise rates at which that company had set up its depreciation reserves in the past?

A. Yes, sir.

Q. And isn't that same situation true of the Mountain State Gas Company?

A. I believe those records were available.

Q. And the fact is that you didn't look at them?

A. Oh, yes; we looked at them——

Q. (Interposing.) So far as ascertaining at what rates the depreciation reserves of these predecessor companies were set up?

A. I personally did not, because I was not interested in those rates, but some of the members of the staff may have looked at them.

Q. Well, did they advise you what they were?

A. Not that I recall.

Q. Do you know of any memorandum in Commission's files that states what they were?

A. No.

Q. Well, isn't it a fact, Mr. Dunn, that by adding what you call these "Reserves Acquired" in line 48, which we have talked about, you have just assumed that this acquired reserve at the date of purchase accurately represented the accrued depreciation in that property as of the date of purchase?

3690 A. I don't know that I have assumed it—it did.

Q. Oh, you think it did?

A. Yes.

Q. And did you know, when you used these figures in schedule No. 3 and elsewhere, what the relationship of the accrued reserves, as shown on the Clarksburg Light & Heat Company's books, was to its gross book cost of its plant at the time of purchase by the Hope Company?

A. Yes; I knew the relationship of reserve to the gross book cost and purchase price.

Q. And what was that relationship for the Clarksburg Light & Heat Company properties?

A. I don't have those acquisition work sheets down here.

Q. Well, will you have them after lunch?

A. Yes.

Q. Let me ask you to check on those sheets, Mr. Dunn, as to whether it isn't a fact that the depreciation reserve of the Clarksburg Light & Heat Company was about 43.8 per cent of the book cost of its properties at the time it was purchased by the Hope Company; and whether, in the case of the Mountain State Gas Company, the Mountain State Gas Company's bookkeeping reserve wasn't 52 per cent of the gross book cost of its properties at the time Hope purchased it?

* * *

3692 By Mr. MILLER:

Q. Mr. Dunn, were you able to check during the recess the percentages I gave you just before adjournment?

A. I checked the percentages. I do not believe I found them exactly the same as yours. I will give them to you, though.

Q. What did you find?

A. On Clarksburg Light & Heat the reserve was 39.8 per cent of the plant account and the net book cost was 60.2 per cent of the plant account.

Q. That was at the time of Hope's purchase of Clarksburg Light & Heat?

A. That is correct.

Q. That was in 1929, was it?

A. Correct. On Mountain State the reserve was 48.9 per cent of the plant account and the purchase price or net book cost was 51.07 per cent of the plant accounts.

Q. Are those dollars shown in your work sheet, that
3693 is the figures from which you derive the percentages?

A. Yes.

Q. Was that Mountain State Gas Company purchase made in 1910?

A. Yes.

Q. Could you give us the dollars that you used for your computation for Clarksburg Light & Heat?

A. Yes. Gross book cost $2,169,692.69; reserves, $863,942.09. On Mountain State plant accounts, $1,299,418.21; reserves, $65,755.

Q. Did you check also the Carter purchase or not?

A. I did not check the Carter purchase.

Q. You did not make any investigation, did you, Mr. Dunn, as to whether the relationship between the reserves and the gross book cost of the Clarksburg Light & Heat Company and the Mountain State Gas Company corresponded in any way to the physical condition of the properties that were purchased by the Hope Company?

A. No; I did not.

Q. Or in any way measure the expired service life?

A. No. That would have required a service life study by the engineers, and I did not do that.

Q. And as far as you know, the engineers made no such examination or determination?

A. No.

3694 Q. Is it not also a fact, Mr. Dunn, that you did not determine what would have been a proper reserve for Clarksburg Light & Heat Company and the Mountain State Gas Company to have had at the time Hope purchased the properties on the depreciation rates that Mr. French supplied you?

A. No; I did not make such investigation.

Q. In other words, you did not redetermine the depreciation reserves or the accrued depreciation, or the actual existing depreciation, insofar as those properties were concerned at the time of purchase?

A. I would like to say that to Hope the actual existing depreciation stated on the cost basis was, in the case of Clarksburg, $863,942.09. Now, as far as Clarksburg is concerned, I did not restate their accrued.

Q. What do you mean by the statement that you hope the actual existing depreciation was so much?

Mr. SLAFF. He said "to Hope."

The WITNESS. As far as Hope's cost is concerned, that is what the actual existing depreciation is.

By Mr. MILDE:

Q. Just how did you arrive at that conclusion, Mr. Dunn?

A. Hope recorded an original cost of $2,233,252.76 as the original cost of the property, and——

* * *

3696 The WITNESS. The difference is $1,369,310.67, which they paid for this property, $1,369,300 even, making a difference of $10.67. Therefore the depreciation amount of $863,000 is the actual depreciation on a cost basis. It can not be otherwise. To do so would change the cost.

By Mr. MILDE:

Q. Mr. Dunn, will you now explain the difference between the figure of $2,169,000, which you gave me before, and the $2,233,000 which was the gross book cost of the Clarksburg properties?

A. Yes. That difference is largely some construction work in progress.

Q. I see. When you said that Hope recorded $2,233,000 as the original cost I judge that what you mean is that Hope recorded that amount of money which was the book cost to the Clarksburg Light & Heat Company in Hope's plant account, is that not so?

A. Yes. Those two figures combined make the original cost to Hope.

Q. And when you say that the difference between the purchase price and the gross book cost of the Clarksburg Light & Heat Company represents depreciation of Hope—is that

3697 what you said?

A. Yes.

Q. What you mean is, and all that you mean is that Hope paid $1,300,000 for property that the Clarksburg Light & Heat Company showed on its books as having a book cost of $2,233,000?

A. A net book cost of $1,369,310, exactly what they paid.

Q. Well, how can the difference between the cost to the predecessor utility of these properties and what Hope Company paid for them represent depreciation to the Hope Company?

A. Well, that is merely the difference between recording net purchase price and Hope's purchase price and reserve accounting. That is an option that is quite often made.

Q. That is all you meant by it? It is just that difference that you are talking about here?

A. I am talking about actual cost figures here all the way through.

Q. Well, so far as those properties which were purchased were concerned, you do not know, do you, Mr. Dunn, whether the difference between the gross book cost as shown on the Clarksburg Light & Heat Company books and what the Hope Company paid Clarksburg Light & Heat for those properties measured the correct reserve accrual for those properties or the actual existing depreciation, or the accrued depreciation as you
3698 used it in your exhibit, or the expired service life of those properties, do you?

A. I do not think that that point has any importance whatsoever in this transaction, of course not. Therefore I did not go back and investigate that, as I told you many times.

Q. I am not concerned with whether you thought it was important, Mr. Dunn. All I want to know is, you do not know and you made no investigation as to whether that difference between the book cost as shown on the Clarksburg Light & Heat Company books and what Hope paid, and the lesser amount that Hope paid the Clarksburg Light & Heat Company represented the items that I have just enumerated?

Mr. SLAFF. He answered that already in the answer to the last question, at the end of his answer. He said, "And therefore I made no investigation." The question has been answered. Why can not we go on to the next question? I object.

TRIAL EXAMINER. That is your answer, is it?

The WITNESS. That is right.

Mr. MILDE. I also asked him not only whether he made any investigation but whether he knew anything about it.

The WITNESS. I think this $863,000 is a very good measure of the accrued depreciation of the property.

By Mr. MILDE:

Q. You reached that conclusion without having made any investigation, I judge?

A. I reached that conclusion because that is what Hope
3699 paid for it in cash.

Q. And if Hope got a good bargain, would you say that because it got a good bargain the properties were more depreciated than if it had made a bad bargain?

A. Possibly. On a different set-up I do not know just what my answer would be.

Q. If the Hope Company had paid the Clarksburg Light & Heat Company, say, $2,000,000 instead of $1,300,000, on your method of handling this matter you would have then shown, would you not, a reserve acquired of $233,000 or thereabouts instead of the $863,000?

A. Not necessarily. Again I would see what the relationship was between the amount recorded on the books as original cost, the amount recorded in reserve for depreciation and the purchase price. I would want to study all factors involved before I made a decision on the transaction.

## 6752 TESTIMONY OF F. P. C. WITNESS DUNN ON COMPARISON OF DEPRECIATION RATES

Transcript pages 6752–6756

Direct examination by Mr. SPRINGER:

Q. Referring to Exhibit 142, Mr. Dunn, did you prepare this exhibit?

A. Yes.

Q. Are the sources of the figures and explanations of the table shown at the bottom of the sheet?

A. Yes; they are.

Q. What is the purpose of this exhibit?

A. To show that different depreciation rates, when applied properly and consistently, make little or no difference when compared in terms of cost to ratepayers.

In a comparison of the factors determining costs and rates, it is necessary to present the comparative figures on a cost basis. This statement applies particularly to depreciation expense and net property.

The difference in net property have been stated in terms of cost, as shown by column "H" on page 1, by applying an assumed 6-percent rate of return.

Q. The figures on page 1 do not compare those accounts where reserves and expenses are computed on a depletion
6753 basis, do they?

A. No; the depletion accounts cannot be compared by the same method used to compare the depreciation accounts because the depletion rates vary with production.

Q. What does the comparison as between Rhodes and French depreciation rate show when stated in terms of cost to ratepayers?

A. The difference is a saving to ratepayers of $24,621 by reason of using French rates.

Q. The figures shown on page 2 make a comparison of cost to ratepayers for return and depletion of operated leases, do they not?

A. Yes; these figures are taken from exhibits in the record. The comparison is confined to operated leases because this is the only account where per cent condition is applied to original cost and related expense is stated in terms of original cost.

Q. Mr. Rhodes' shows a higher original cost, does it not?

A. Yes; approximately $85,000 higher as determined by Witness Antonelli.

Q. Even so, his per cent condition method shows a lower net cost, does it not?

A. Yes; in the amount of $145,855.

Q. If you both started with the same figure, the
6754 difference would be more pronounced?

A. Yes.

Q. Do you recommend a larger expense than the company claims?

A. Yes; $15,423 higher, averaged for four years.

Q. What does the comparison of depletion expense and return on operated leaseholds show when stated in terms of cost to ratepayers?

A. The difference is an increased cost to ratepayers of $24,174, by reason of using the Federal Power Commission Examiner's accounting method.

Q. And that amount is an offset to the $24,000 you referred to on page 1 for depreciation, isn't it?

A. That is correct.

Q. Operated leaseholds amount to $1,600,000 of cost at December 31, 1938. Is there much other property which you have accounted for by depletion methods?

A. Yes; amounting to over $8,000,000, which property has not been compared in this exhibit.

Q. Do you recall a question, shown on page 3123 of the record, by Mr. Reeder, concerning the method used in depleting the capitalized well construction of some 722 wells, as to whether your reserve would be higher or lower if you had used the company method? What was your answer?

A. My answer is just that I remember the question
6755 and I answered that I believed the reserve would be higher using methods as proposed by the company. The company actually uses the accounting method and not a percent condition method on their books.

Q. Do you recall a similar question by Mr. Reeder concerning a higher or lower annual allowance for depletion?

A. Yes; and my answer was that the company method would have resulted in a lower annual allowance.

Q. That means that the company would have a lower rate base and less annual allowance?

A. Yes.

Q. Are you satisfied that your answers are correct?

A. Yes, because the same depletion methods have been applied to operated leaseholds. The net cost is lower and the annual expense is lower by reason of a percent condition method being applied to leaseholds, applying the percent condition method to well construction would produce similar results.

Mr. SPRINGER. I offer in evidence Exhibit No. 142.

TRIAL EXAMINER. Any objection?

Mr. MILDE. No objection.

TRIAL EXAMINER. Exhibit 142 is admitted into evidence.

(The document referred to was received in evidence as Exhibit No. 142.)

TRIAL EXAMINER. Is there any cross-examination?

6756 Mr. MILDE. Just one question.

Cross-examination by Mr. MILDE:

Q. Mr. Dunn, in this exhibit you have applied Mr. Rhodes' rates to your figures, have you not?

A. That is correct.

Q. That is, as shown in colnm "B", that is the adjusted book cost as set forth in other Commission exhibits?

A. Yes.

Q. And also you recognize, do you not, that column "H," if you used a 7 percent return for example, that that would about double the difference shown in column "J"?

A. Well, I don't think it would double it. I think I used 8 percent as a comparison, which I don't have noted here, just to see whether it would double it or not, and I don't think it increased it but very slightly.

Q. Our figure using 8 percent is $70,868 for the bottom column "J." Does that check with your figure?

A. Yes; I recall the amount.

Mr. MILDE. That is all.

* * *

6394 **TESTIMONY OF F. P. C. WITNESS BLEASE ON COMPARISON OF METHODS AND RESULTS FOR CREDIT TO HOPE FOR GASOLINE AND BUTANE EXTRACTED BY AFFILIATE**

Transcript Pages 6394–6405

Mr. SPRINGER. May I have marked for identification as Exhibit No. 127, this tabulation entitled "Hope Natural Gas Company—Comparison of Methods and Results of Commission Staff's Recommendation and Company's Witnesses' Recommendations for Proper Credit on Account of Gasoline and Butane Extraction"?

TRIAL EXAMINER. It may be so marked.

(The tabulation referred to was marked as Exhibit No. 127 for identification.)

Whereupon,

ERNEST B. BLEASE, a witness appearing on behalf of the Commission, having previously been duly sworn, was examined and testified as follows:

Direct examination by Mr. SPRINGER:

Q. Mr. Blease, referring to the exhibit marked for identification as 127, will you state the purpose of that exhibit which you prepared?

A. I prepared this exhibit from exhibits that have already been admitted in evidence in this hearing, for the purpose of correlating and showing in one place the effect of the exhibit on gasoline that I prepared, and also a comparison of that
6395 effect to the credit that Mr. Rhodes recommends for gasoline extraction by Hope Construction and Refining Company.

Mr. SPRINGER. I offer in evidence Exhibit 127.

Mr. MILDE. No objection except that I would like to ask Mr. Blease a question or two on cross-examination.

TRIAL EXAMINER. Does that complete the direct testimony?

Mr. SPRINGER. Yes, sir.

TRIAL EXAMINER. You may cross-examine.

Mr. SPRINGER. The exhibit was designed to be self-explanatory, showing sources of information, but if you have some additional questions, Mr. Examiner, Mr. Blease will be glad to answer them.

TRIAL EXAMINER. If it is self-explanatory, I don't have any. I haven't had a chance to look it over to see whether it is or not.

Mr. SPRINGER. I know you haven't, and I thought perhaps you would like to have more of an explanation.

Mr. MILDE. Perhaps I can ask a few questions on cross-examination that will help to explain it.

TRIAL EXAMINER. I assume that by referring to these other exhibits, this exhibit will be understood?

The WITNESS. The figures shown on this exhibit were taken from other exhibits and the reference to the exhibit and page number is shown on this exhibit.

* * *

6396 Cross-examination by Mr. MILDE:

Q. On this exhibit 127, as I understand it, the top group of figures under the column headed "Computed Credit to Hope Natural Gas Company" are a summarization of your figures and conclusions in Exhibits 63 and 78, isn't that so?

A. That is correct.

Q. And you show, for example, on the third line, that the average net investment, as you determined it for all of the Hope Construction and Refining gasoline and butane plants was $681,000 in round figures in 1937; and $482,000 in round figures in 1940?

A. That is correct, with the exception of the fact that this only represents the West Virginia plants dealing in Hope Natural Gas Company gas.

Q. That is right.

And you have now excluded the net investment as you determined it of the Kennedy plant as shown on the next line in both 1939 and 1940?

A. That is correct.

Q. And that gives you a balance of net investment to which you have added working capital of $80,000 to give a sum total on which you apply 6 percent return?

A. That is correct.

6397 Q. And is that 6 percent return your determination of what is a proper rate of return for gasoline plants, or is that merely a figure assumed for the purpose of this calculation?

A. It is a figure assumed for the purpose of this calculation.

Q. Then you take the earnings as you adjust them by your revised depreciation rate, and take out the Kennedy plant earnings, in 1939 and 1940, to get revised net earnings of the company for these plants which you have described?

A. That is, the revised earnings over 6 percent on the net investment.

Q. Well, that is the figure you show opposite the side heading "Excess of Above Earnings Over 6 Percent of Net Investment"?

A. That is correct.

Q. Now, in the balance of the figures you give some information as to how matters were recorded on the books, and what Mr. Rhodes' charges are, or his adjustments?

A. Mr. Rhodes' credit adjustments, you might say.

Q. Let me ask you, Mr. Blease, if the royalty recommended by Mr. Rhodes is not shown opposite the side heading, "Total Credit Recommended by Rhodes," a few lines up from the bottom?

A. That is correct.

Q. And that is $215,000 in 1937, and $167,000, in round
6398 figures, in 1940, with other amounts for the other years?

A. That is correct.

Q. Now, you subtract that $215,000 from what figure in order to show your next line, "Difference (Commission Staff over Rhodes)"?

6399 A. I subtract that $215,000 from $510,000, which is the 7th figure above the bottom. It is in connection with the side heading, "Total Credit Recommended by Commission Examiners."

Q. In other words, for the year 1937, the sum total of the examiners' recommendations is that the Hope Company be deemed to have received $510,000 in connection with this gasoline extraction process?

A. That is correct.

Q. And Mr. Rhodes said they should have received $215,000?

A. That is correct.

Q. And the difference between the two figures, then, is your $294,000?

A. That is correct.

Q. Let me ask you if that $510,000, which the staff recommends, isn't practically 70 percent of the plant investment as you determined it for 1937?

A. That is correct.

Q. Now I am slightly puzzled by this next line of yours, Mr. Blease, "Vent Gas Returned Not Adjusted by Rhodes." What is the meaning of that line?

A. Well, in computing the difference between us, that line is shown to take up the greater portion had Rhodes treated the vent gas as a property of Hope Natural Gas Company, instead of treating it as he did——

6400 Q. (Interposing.) As the property of Hope Construction and Refining Company?

A. That is correct. Then our differences would have been those shown on the last line.

Q. And shouldn't you really, to make the last line of this exhibit not misleading, say "Net difference (Commission Staff over Rhodes if Rhodes had treated vent gas as the Commission's Staff has treated it)"?

A. In order to clarify that, let's say that it should read "Difference (Commission Staff over Rhodes had Rhodes considered the vent gas the property of the Hope Natural Gas Company)".

Q. As the Commission's staff has considered it?

A. I have considered it the property of the Hope Natural Gas Company, but under the method that I used, it would have made no difference, because that credit would have come into Hope Construction and Refining Company's books, and would have increased the amount of excess profits passed back to Hope by the same amount as the vent gas credit.

Q. I understand that, Mr. Blease. All I was trying to point out is that that phrase in parenthesis is not complete in that it is not really the "Commission Staff over Rhodes", but the Commission Staff over Rhodes as you have adjusted Rhodes in the preceding line?

A. That is correct. Perhaps it would be clearer to
6401 say that in the third line where I show "difference (Commission Staff over Rhodes)," to add "as recommended by both." Then this next adjustment or next line, showing the vent gas returned not adjusted by Rhodes, would become clear, I think.

Mr. MILDE. May I ask whether the Examiner understands that this last line means the difference if Mr. Rhodes' figures, as shown in the third line from the bottom, had been adjusted as Mr. Blease adjusts them in the second line from the bottom?

Is that a correct statement, Mr. Blease?

The WITNESS. Yes, it is correct, but I still don't think it clarifies it.

TRIAL EXAMINER. Well, the difference would be the same in either case, wouldn't it?

The WITNESS. As the exhibits are now in the record, the recommendations that we make are over the recommendations that Mr. Rhodes has made by the amount shown on the third line from the bottom.

Now I am merely stating that if Mr. Rhodes had adjusted for vent gas, the difference would have been that shown on the last line.

TRIAL EXAMINER. But Mr. Rhodes didn't adjust for vent gas?

The WITNESS. Mr. Rhodes did not.

TRIAL EXAMINER. And you did?

The WITNESS. I did adjust for vent gas, but whether I
6402 had adjusted for vent gas or not, using this method I would have come out to the same result. It was a debit and credit between two companies.

Mr. MILDE. Well, this is just one of those questions where, when you get an exhibit up in a hurry, it is a little difficult always to select quite the right title to express what you have done.

By Mr. MILDE:

Q. Well actually, as the figures appear in the two sets of exhibits, Mr. Blease, the difference between the Commission's staff and Mr. Rhodes' figures, as reflected in our exhibits, is shown in the third line from the bottom, right across the page, is it not?

A. It is.

Q. With the exception that for the years 1939 and 1940, as shown in the other Commission's exhibit, the Kennedy plant investment has not yet been taken out, and earnings?

A. For the years 1939 and 1940, the Kennedy plant has been taken out.

Q. In this exhibit?

A. Yes.

Q. But not in Mr. Dunn's exhibits and Mr. Lyon's exhibits, where they used your original figures?

A. That is correct. You will remember that there was a stipu-
lation decided on between counsel while I was on the stand
6403 before, that that was to come out, and in this exhibit I have taken that out.

Q. So that the figures that should be reflected in these other exhibits on final determination of what the Commission's staff shows are the figures you set out here for 1939 and 1940?

A. To be in accordance with the stipulation

Q. That is right.

Mr. MILDE. That is all.

Redirect examination by Mr. SPRINGER:

Q. Will you explain your answer to Mr. Milde concerning the consequences of your adjustment for vent gas in any one of the years by an example, when you say you would have received the same answer in any event?

A. As the books are kept presently, H. C. & R. charges Hope for the vent gas returned, and Hope charges H. C. & R. for boiler fuel furnished in the same amounts with a slight difference in one plant.

In my study I have based the revenue due Hope Construction and Refining to a cost study, and limited the return to a ratio of the net investment. I have selected 6 percent here.

6404 So that, that return would be constant if the value of the plant remains constant, and any increase in revenue would be—any increase in gross revenue—would be that much increase in net revenue, or excess credit. So that, had I not adjusted for vent gas, I would have had that much additional credit on H. C. & R.'s books to come out down here as excess earnings over 6 percent of net investment; and when you combine the earnings of H. C. & R. with the earnings of Hope, it makes a Wash transaction and makes no difference in the final answer of the amount of credit recommended by Commission's staff.

Q. In what line?

A. That is the 7th line from the bottom, side heading, "Total Credit recommended by Commission Examiners."

Recross-examination by Mr. MILDE:

Q. Mr. Blease, I think I was mistaken in asking you if the figures in the third line from the bottom were not the ones to be reflected. That is just the difference between you and Mr. Rhodes, and actually the final figures that you recommend are shown opposite the side heading, "Total Credit recommended by Commission Examiners"—isn't that so?

A. That is correct. I understood that you meant that the difference between the two exhibits was the third line from the bottom.

6405 Q. Well, that is the difference between us, but the figures that are to be reflected in the Commission examiners' exhibits as the amount of money Hope is to receive on account of

this gasoline extraction process conducted by the H. C. & R. Company are the $510,000 you show for 1937, ranging down, and up again, and then back to $313,000, as shown opposite the side heading I have indicated?

A. That is correct, and let me state further that for 1937 and 1938, they are the figures used, but for 1939 and 1940, they have been adjusted by the Kennedy plant here.

Q. That is right.

## TESTIMONY OF HOPE WITNESS COFFMAN ON INVESTORS' APPRAISAL OF COMPARATIVE RISKS OF CAPITAL IN THE NATURAL GAS BUSINESS

Transcript pages 5663–5725

5663 Direct examination by Mr. COCKLEY:

Q. Mr. Coffman, you have been sworn and you previously testified in this case, did you not?

A. I did; yes, sir.

Mr. COCKLEY. I ask to have marked for identification as Exhibit 27–A, a paper entitled, "Hope Natural Gas Company—Investors' Appraisal of Comparative Risks of Capital in the Natural Gas Business, 1940—(Supplement to Exhibit No. 27)."

TRIAL EXAMINER. It may be so marked.

(The document referred to was marked "Exhibit No. 27–A" for identification.)

By Mr. COCKLEY:

Q. I hand you the paper, Mr. Coffman, marked for identification No. 27–A, and ask you if you prepared that exhibit, and if it contains your direct testimony supplementing
5664 your Exhibit No. 27 previously introduced in this case?

A. Yes, sir; it does.

Q. And the tables included therein weer prepared by you from ordinary statistical sources and in your office?

A. Yes, sir; they were.

Mr. COCKLEY. Mr. Examiner, I think it is unnecessary to ask the witness any questions in explanation of this unless the Examiner has some.

You will see on page 1 of the written statement of Mr. Coffman, a table which contains a summation of the results that he found in 1940, and the averages for the four years from 1937 to 1940. You will recall that his original Exhibit 27 was a study of electric utility operating companies, water companies, manufactured and mixed gas companies, and natural gas companies for the 3-year period, and that the determination of the investors' appraisel of the risk in those companies for the 3-year period, and the average for the 3 years. This exhibit merely adds the

figures for 1940, and makes the average for the four years, and shows in general that while there have been slight changes, in general the same relation between the investors' appraisal of these various companies has been maintained right through the year 1940. I offer in evidence Exhibit 27–A.

Mr. SPRINGER. No objection.

TRIAL EXAMINER. Does the City of Cleveland have any
5665 objection?

Mr. REEDER. No objection.

TRIAL EXAMINER. West Virginia?

Mr. KOONTZ. No objection.

TRIAL EXAMINER. Exhibit No. 27–A is admitted in evidence.

(Exhibit No. 27–A was received in evidence.)

Mr. COCKLEY. You may cross-examine.

Cross-examination by Mr. SPRINGER:

Q. Will you please refer to page 2 of Exhibit 27–A? The first paragraph shows a statement by you that, "investors continued to appraise the risk of natural gas companies as a group at a rate considerably higher than for the other divisions of the utility industry studied."

Does that mean that all your exhibit shows for the particular companies selected for your study is that natural gas companies are considered a relatively greater risk than electric companies, and water, and so forth?

A. I would say that that statement means that in the study we made, in which, as you will recall, we tried to get and include in thiss tudy all the companies upon which we could find data which would indicate the investors' appraisal, that that particular risk shows a higher risk factor in the minds of the investors for the natural gas than does it show for the other divisions of the utility industry which I studied.

5666 Mr. SPRINGER. Will you read my question? I think you have answered the question, but I would like to have it read back to the witness.

TRIAL EXAMINER. Read the question.

(The question was read.)

Mr. COCKLEY. Do you mean by that question that that is all that the exhibit shows, and nothing else?

By Mr. SPRINGER:

Q. That is the purpose of the study, isn't it; a comparison study?

A. That is correct, Mr. Springer. All I wanted to make clear in my answer was that going back to the original study, as you will recall, I had gone over all of the various utility companies in these divisions that I have mentioned here, that is, the electric, water, and natural gas and mixed gas, that are reported upon in our services, and as I had explained in my original exhibit, certain of those were eliminated for lack of data which would not permit me to make such a study complete, with the result that I finally came down to the list of companies that was actually included in my first exhibit, and insofar as those companies represent the entire division of the various branches of the utility industry upon which I could get an investors' appraisal, I think it is as complete as I could make it. I don't know whether that still answers
5667 your question, but that is about the only way I can answer it, I believe.

Q. Then your exhibit shows, for the particular companies you studied in these classifications, that the investors' appraisal of risk shows a relatively higher risk for natural gas companies in your particular study than for electric companies in your particular study, and water companies?

A. Yes; I would say that, and qualify it with the statement that the companies given in the various divisions were all the companies in each division that I could find comparable data upon which to make the study.

Q. Now on that point did you take companies for your study, the ones which had bonds, preferred stocks and common stocks held by the public?

A. In each case I took the companies where the great bulk of the capital, whether it be bonds, preferred stock or common, was in securities which were held in the hands of the public as contrasted with some company that belonged to a system where I could not get market quotations on a large part of the capital structure. My study is based altogether upon securities that were in the hands of the public, where I could get fairly reliable market quotations.

Q. Are there any of your 13 natural gas companies in which not 100 percent of the common stock was held by the public?

A. Well, offhand I wouldn't want to say that 100 percent
5668 of the common stock in every case was held, but I would say that a large part of it was held, and that there were sufficient shares traded in the market to give a reliable market quotation.

Q. Now if a major portion of a gas company's securities were

in bonds, not held by the public, it wouldn't be included in your study?

A. That is, if a large portion of the securities were not held such that we could get a market quotation on it, we eliminated that.

Q. Now, if a major portion of a natural gas company's securities were represented by preferred stock and not held by the public, it wouldn't be included in your study?

A. I would like to qualify that to this extent, that generally speaking that is true with one qualification, that if, taking the total capitalization, there were a sufficient number of bonds, preferred stocks or common, held by the public so that a reliable quotation could be secured, I used it. However, if there were some notes, for example, or a very small issue of preferred, which was not in the hands of the public, but that in proportion to the total was very small, then I used it anyway, because taking the total capital I still had a fair representation of the amount of investors' money in the particular company.

Q. Now there were some natural gas companies' securities
5669 on which you were unable to secure market prices, weren't there?

A. There were some companies in which a small part of the capital structure there was not a market for, and in that case I made an estimate.

Q. What did you use?

A. In that case we used our experience and our knowledge of the securities, plus making a study of another security we believed to be comparable, which did have a price in the market so it would give us some guide upon which to go.

In most cases, as a matter of fact, they were situations where a stock, for instance, if it was a preferred, had a callable price, or some other guide, and the security was in such position in the capital structure and the earnings of the company were such that we thought we were in no error in taking the call price, if that is the figure we used.

Q. Will you list by name those natural gas companies for which you secured no market price for the securities, and used your estimate?

Mr. COCKLEY. You mean a market price of all the securities?

Mr. SPRINGER. Just what we are talking about.

The WITNESS. You are talking of 1940 figures, for the moment?

5670 By Mr. SPRINGER:

Q. Yes; just Exhibit 27-A.

A. Starting with my table marked Statement "D," page 6, the first company there is Duquesne Natural Gas.

In the case of Duquesne Natural Gas there were 124,556 shares outstanding of common stock; there were 2,410 shares of noncumulative convertible preferred $4 stock; 28,179 shares of $5 noncumulative preferred; and $724,500 of general refunding 7's of 1948.

Now, in each case there was a quotation available, so I made no assumption in the case of Duquesne.

Q. You had the market prices for that?

A. There was a market quotation; yes, sir.

Q. Well, will you just give me the names of the companies for which you didn't have market quotations?

A. El Paso Natural Gas is the first one.

In the case of El Paso Natural Gas for 1940 there were 601,594 shares of $3 par common stock outstanding. The indicated market value of that was $20,418,000. There was a quotation upon those securities.

There were 14,797 shares of 7 percent cumulative preferred, $100 par, which amounted to a million and a half, approximately, and there were quotations on that. Then there were also outstanding $6,000,000 of first mortgage 3½'s of 1953; $2,900,-
5671 000 of first mortgage 3's of 1955; $1,445,000 of 3 percent serial notes, due 1941 to 1945; and $1,000,000 of 2¾ percent serial notes due at the same time, outstanding. Now on the first mortgage 3½'s and 3's, and the serial notes, 3 percent and 2¾, there was no quotation.

Q. Those securities are all held by institutional investors, aren't they?

A. That is right; and in that case I took the par of the particular security, and the reason for that, so far as the notes were concerned, they were very near term maturity so that obviously they would approach par as they came to the date of their maturity; and the first mortgages, 3 and 3½'s, in studying other similar securities we felt safe in taking par.

However, for my purposes, of the total capitalization of $31,-900,000, almost $22,000,000 of the total was accounted for with actual quotations, and about 10½ million were on the mortgages and the serial notes upon which there was not a quotation and on which I took the par of the security. So that I had over two-

thirds of the capital structure accounted for with market quotations; and the others, upon which I made an estimate, I felt I had taken a conservative figure.

Q. My information is that the total securities outstanding for El Paso Natural Gas Company are a little over
5672 $18,000,000, and that about $7,000,000 of those are held by the public and about $11,000,000-plus are held by institutional investors.

A. Are you there including the common stock; is that everything?

Q. Yes; total outstanding securities.

A. That probably is right. I don't know your exact figure, but I would assume that that was about right, but for my study, so long as there were sufficient shares traded in on the market to give a bona fide quotation, I felt that was a reliable index of what the investors said, even though an institution might buy to hold, or for that matter might buy to trade in from time to time.

5673 Q. Then you had an elastic standard, it wasn't necessarily market quotations on the major portion of the outstanding securities of natural gas companies that you sought, it was some representative figure that you were after?

A. No; I wouldn't say that, Mr. Springer.

Q. Well, didn't you just say that of the outstanding securities of El Paso Natural Gas Company, of more than $18,000,000, $6,000,000 of that was held by the public which represented preferred and common stock, and that the remaining $11,000,000-plus, which was bonds and notes was held by institutions? Now, there the major portion of the outstanding securities is held by institutions, so you substituted something for the securities held by institutions where you couldn't secure market quotations?

A. Well, just going back for a minute, my figures don't quite line up with yours. In the first place the total indicated market value, according to the figures I have, I have given you for 1940 on El Paso was $33,300,000.

Q. We aren't talking about the same thing. I am talking about the same thing. I am talking about total outstanding securities, and you are talking about total indicated market value.

A. But my point is that to appraise the value as the
5674 investor sees it, of the total capitalization, you have to take some guide for each, and in the case of the great bulk of this item, which refers to common stock, I took market quotations and there are ample shares of common stock of El Paso

traded to give a good investors' appraisal of that particular portion of their capital structure. So whether or not the banks or insurance companies or some large individuals hold a certain portion of that, makes no difference as long as there was ample trading to get a quotation.

Q. Well, I just wanted to get your standards; that is one of your standards?

A. Yes; I took the market quotation, and whether an institution held these or not, I assume in practically every case—as a matter of fact, I know in practically each of these cases—there are one or more branches of the capital structure that are held by institutions, with respect to all these companies. We are advocating in many cases that they buy them. But I don't see that that has any bearing on my study so long as there were enough of the shares traded for me to get an idea of what you must pay if you go into the market to obtain certain additional shares or certain additional bonds.

Q. Well, your standards are limited by what is available
5675 in the market, and whether quotations are available or not, and then the additional estimates that you make to get a study of each gas company?

A. Where there is not a quotation; but in each case, as I say, that is on a small fraction of the total, in each of these cases.

Q. Will you continue with the list of companies where you couldn't get market quotations on the security?

Mr. COCKLEY. Do you mean on all the securities?

Mr. SPRINGER. No.

The WITNESS. If I may, I might comment on each of these. The Houston Natural Gas does not fall into your classification. There were quotations on everything. Interstate Natural Gas—also no problem.

Mr. COCKLEY. Do you mean by that that there were quotations on all classes of securities?

The WITNESS. Yes; I merely want to account for these companies as I go through.

By Mr. SPRINGER:

Q. For the Houston Natural Gas Company, the total outstanding securities were a little over $5,000,000, all held by the public, and that is the reason you secured the information?

A. Well, I want to make my point clear again. I am not saying in any one of these things that all the securities—where I say

5676 there is a market quotation—were held by the public, unless you include as the public, the banks, the insurance companies and every other investor. So far as I am concerned, any securities that were issued by any company, which are not in turn held by another company, which makes it a holding company arrangement, are securities in the hands of the public. It makes no difference to me whether they are insurance companies or not.

Q. I see. Your classification of institutional investors puts them in the public investor class?

A. Exactly.

Q. As distinguished from the affiliated investors?

A. Absolutely; yes, indeed, because to me as an investment advisor, they are just as much a part of the investing public as Tom, Dick, and Harry.

Q. Well, they must be fairly good securities, or you wouldn't advise an institution to buy them?

A. Well, that is true, they have to be in most cases to qualify as a legal investment, as you know. Interstate Natural Gas—no problem. We come to Lone Star Gas Corporation——

Mr. COCKLEY (interposing.) Mr. Coffman, for the record, when you say "no problem," that doesn't mean anything. Can't you explain more specifically?

The WITNESS. In the case of the Interstate Gas Company, we had quotations so that no estimate was made.

5677 In the case of Lone Star Gas Corporation, there were outstanding approximately 5,500,000 shares of no par common stock, upon which we had reliable market quotations, and that accounted for approximately $50,582,000 indicated market value. There were also outstanding 3½ debentures of 1953 to the amount of $20,000,000, upon which there were reliable quotations which gave an indicated market value of $21,500,000. There were also some notes, 2⅞ percent, due 1945, in the amount of $4,200,000. On those notes, they were all held by a single investor, and there was no question, so I took those at par $100.

By Mr. SPRINGER:

Q. By a single investor, do you mean an institutional investor?

A. In this particular case, I think it was. So that here, out of a total indicated market value of $76,287,000, I have accounted for about $72,000,000 by actual quotations. So that there, by far the greatest amount of the capital structure was accounted for by indicated market value, as based upon the investors' quotations in the market.

In the case of Memphis Natural Gas Company, there were 918,680 shares of common stock, $5 par value, outstanding, upon which there were market quotations, giving a total indicated market value of $4,023,000.

5678 There were also outstanding some 3 to 3½ percent promissory notes payable to banks serially in the amount of $1,700,000. Obviously, there was no quotation on those notes, and there was no reason to take them at other than par, which is the figure that I used, $100. So that, in that case, the great bulk of the indicated market value was based upon investors' quotations.

Q. And for Mountain Fuel Supply, their common stock is all held by the public?

A. In the case of Mountain Fuel Supply, all the stock is held, and I had quotations so I accounted for all that.

Q. Is that the same for National Fuel Gas Company?

A. Yes; the same is true there. In the case of Northern Oklahoma Gas Company, there were 189,300 shares of common stock, $1 par value, outstanding, upon which there were market quotations. There was also a first mortgage serial note which was held privately in the amount of $550,000, and upon that of course there was no quotation, and I took that at par; there was no reason for such securities to sell at anything in excess.

Mr. COCKLEY. What was the interest rate on that note?

The WITNESS. I believe that was 5 percent. Yes: 5 percent I am pretty sure.

5679 Now, in the case of the Northern Utilities Company, although there was common stock, 7 percent preferred and some first mortgage convertible bonds and income debentures outstanding, there were quotations on all branches, so I made no estimate there.

In the case of Oklahoma Natural Gas, there were 550,000 shares $15 par common stock outstanding, upon which there were quotations.

There were 58,000 shares of 5.50 convertible prior preferred no par upon which there were quotations, and 91,055 shares of 3 cumulative preferred, $50 par, upon which there were quotations.

There were $16,800,000 of first mortgage 3¼'s due in 1955 upon which there were quotations, but there were bank loans payable serially to 1946 of $5,500,000, upon which, of course, there were no quotations. So I took that at an estimated figure of $100 to complete it.

By Mr. SPRINGER:

Q. Was that 2¾ percent?

A. I don't recall what that percent was. Three and three-quarters percent was the rate on the bonds, the first-mortgage bonds, and I do not have the rate that is required upon the bank loans.

Mr. COCKLEY. Do you have it, Mr. Springer, in a circular or in some form?

5680 The WITNESS. I don't have that bank loan rate.

Mr. SPRINGER. That isn't important, go ahead.

Mr. COCKLEY. I was going to admit whatever figure your information shows, if you have it.

The WITNESS. Well, the 3¾ rate applied to the first mortgage bonds. I don't know what was the rate on the bank loans. In the case of the Pacific Lighting Corporation, there were 1,608,631 shares of common stock upon which there were quotations. There were 200,000 shares of $5 preferred upon which there were quotations. There was some 6 percent preferred $25 par of the Southern California Gas—897,564 shares—upon which there were quotations. But there was a long term serial bank loan from 1942 to 1949 of $6,000,000, upon which there was no quotation, and I took that at par $100.

By Mr. SPRINGER:

Q. Do you know if that was a 3-percent note?

A. I may have that figure. No; I don't have that figure, but 3 percent would sould very reasonable to me.

Mr. COCKLEY. Have you the figure there? You say it is 3 percent?

Mr. SPRINGER. That is my information.

Mr. COCKLEY. We will accept that.

5681 Mr. SPRINGER. Now, will you proceed?

Mr. COCKLEY. May I just ask a question to clarify this?

Mr. SPRINGER. Certainly.

Mr. COCKLEY. How much, out of the total of almost $166,000,000 indicated market value for Pacific Lighting Corporation have you not had market quotations for?

The WITNESS. It was merely on those bank loans of $6,000,000 which I took at par. Everything else was accounted for by a quotation.

By Mr. SPRINGER:

Q. You show investors' appraisal for that company of 5.66 in your exhibit?

A. Yes, sir. In the case of Southern Natural Gas Company, the common stock—691,970 shares outstanding—was accounted for by quotations. There were some Pipe Line 4½'s due in 1951, outstanding, in the amount of $11,300,000, approximately, upon which there were quotations.

There were some other first Pipe Line 4½'s due in 1952 in the amount of $528,000, and those I took at 105½ because they had a long enough maturity date, in so far as the earnings secured them, to make them run above par, in comparison with other similar securities.

There were some adjustment mortgage 6's due in 1960 in the amount of $5,700,000, and those were accounted for by
5682 quotations.

Q. How did you get the quotations on $3,000,000 of those held by affiliates?

A. What, the adjustments?

Q. Yes.

A. As I have explained before, I didn't, where they were held by affiliates, as long as a sufficient portion of any branch of the capital structure was traded in the market so that I could get a security price, I took that. I don't mean to infer that in each of these cases, the entire amount of stock that is issued and outstanding or all the bonds that are issued and outstanding were necessarily traded in the market. I am not saying that, I am merely saying that there was enough trading in each one of the securities upon which I took a price to give me a reliable market quotation.

Q. Is this the fact with regard to Southern Natural Gas Company, that the adjustment mortgage 6's due in 1960 of $5,700,000, almost $3,000,000 of that was owned by the public, a slight amount held by institutions, and then nearly $3,000,000 held by affiliates?

A. I would say that figure is approximately correct. I think I have some details on that.

Q. And the portion that was held by the affiliates, you didn't consider?

5683 A. Yes; I considered it, but on that portion held by the affiliates I took the market quotation that was available and merely multiplied the total amount of bonds outstanding by the market quotation to see what the indicated market valuation of the whole was.

Q. Did you include in your indicated market value of capital the $3,000,000 worth of those adjustment mortgage 6's, due 1960, in your figures?

A. In every one of these cases I have included the entire capital structure. If I had a market quotation to go on, then I applied that against the total amount of securities issued and outstanding, regardless of how they were held.

Q. I see. If you had a market quotation on a segment, you applied that to the total outstanding security of that class?

A. That is correct.
